Semileptonic Mixing Asymmetry

Measurements of A_{SL}^d and A_{SL}^s

Martino Margoni

Università di Padova and INFN

on behalf of the BaBar Collaboration

- Motivation
- D0 Inclusive dilepton Analysis
- D0, LHCb, BaBar Flavor Specific Analyses
- Conclusions

Motivation

CPV in B^0 mixing

• New Particles in the boxes could modify SM expectations

• $B_q^0 - \bar{B}_q^0$ oscillations & decay governed by an Effective Hamiltonian:

$$i \frac{d}{dt} \begin{pmatrix} B_q \\ \bar{B}_q \end{pmatrix} = \left[\begin{pmatrix} M_{11}^q & M_{21}^{q*} \\ M_{21}^q & M_{11}^q \end{pmatrix} - \frac{i}{2} \begin{pmatrix} \Gamma_{11}^q & \Gamma_{21}^{q*} \\ \Gamma_{21}^q & \Gamma_{11}^q \end{pmatrix} \right] \begin{pmatrix} B_q \\ \bar{B}_q \end{pmatrix}$$

$[M_{ij}^q]$ = mass matrix

$[\Gamma_{ij}^q]$ = decay matrix

• Physical Eigenstates with defined masses and widths:

$$|B_q^{L,H}\rangle = \frac{1}{\sqrt{1 + |(q/p)_q|^2}} (|B_q\rangle \pm (q/p)_q |\bar{B}_q\rangle)$$

• If $|(q/p)_q| = 1$ they would be also CP Eigenstates

• Neglecting $o(m_b^2/M_W^2)$:

$$\Delta m_q = m_H - m_L \simeq 2 |M_{12}^q|; \Delta \Gamma_q = \Gamma_L - \Gamma_H \simeq 2 |\Gamma_{12}^q| \cos \phi_q$$

$$\phi_q = \arg(-M_{12}^q / \Gamma_{12}^q) \quad \text{CP violating phase}$$

CPV in B^0 mixing

- CP Asymmetry in $B^0_{(s)}$ mixing (time independent):

$$A_{CP}^q = \frac{\text{Prob}(\bar{B}_q^0 \rightarrow B_q^0, t) - \text{Prob}(B_q^0 \rightarrow \bar{B}_q^0, t)}{\text{Prob}(\bar{B}_q^0 \rightarrow B_q^0, t) + \text{Prob}(B_q^0 \rightarrow \bar{B}_q^0, t)} = \frac{1 - |q/p|_q^4}{1 + |q/p|_q^4} = \frac{|\Gamma_{12}^q|}{|M_{12}^q|} \sin \phi_q$$

- Experimentally: measure charge asymmetry in mixed semileptonic B^0_q decays:

$$A_{CP}^q = A_{SL}^q = \frac{\Gamma(\bar{B}_q^0 \rightarrow B_q^0 \rightarrow l^+ \nu X) - \Gamma(B_q^0 \rightarrow \bar{B}_q^0 \rightarrow l^- \nu X)}{\Gamma(\bar{B}_q^0 \rightarrow B_q^0 \rightarrow l^+ \nu X) + \Gamma(B_q^0 \rightarrow \bar{B}_q^0 \rightarrow l^- \nu X)}$$

CPV in mixing if:

$$A_{SL}^q \neq 0 \leftrightarrow |q/p|_q \neq 1 \leftrightarrow \phi_q \neq 0$$

Standard Model predicts

(Nierste, arXiv:1212.5805 (2012)):

- B^0_d : $A_{SL}^d = (-4.0 \pm 0.6) 10^{-4}$

$$\phi_d = -4.9^\circ \pm 1.4^\circ$$

- B^0_s : $A_{SL}^s = (1.8 \pm 0.3) 10^{-5}$

$$\phi_s = 0.24^\circ \pm 0.06^\circ$$

Beyond Standard Model

(Lenz, Nierste, JHEP 0706, 072 (2007))

- New Physics could modify M_{12}^q and A_{SL}^q leaving Γ_{12}^q unchanged:

$$M_{12}^{NP, q} = M_{12}^{SM, q} \Delta_q; \Delta_q = |\Delta_q| e^{i\phi_q^\Delta}$$

$$A_{SL}^{NP} = \frac{|\Gamma_{12}^q|}{|M_{12}^{SM, q}|} \frac{\sin(\phi_q^{SM} + \phi_q^\Delta)}{|\Delta_q|}$$

CPV in B^0 mixing

Two classes of measurements available:

● Inclusive dilepton asymmetry analyses:

$$A_{SL}^b = \frac{N_b(l^+l^+) - N_b(l^-l^-)}{N_b(l^+l^+) + N_b(l^-l^-)}$$

BaBar, Phys. Rev. Lett. 96 251802 (2006)
Belle, Phys. Rev. D 73 112002 (2006)
DO, Phys. Rev. D 84,052007 (2011)

● Hadron Colliders Experiments measure a combination of B_d^0 & B_s^0 CP

parameters: $A_{SL}^b = C_d A_{SL}^d + C_s A_{SL}^s$

➤ $C_{d,s}$ depend on $B_{d,s}^0$ production rates & mixing probability

➤ SM predicts: $A_{SL}^b = (-0.028^{+0.005}_{-0.006})\%$

● Flavor specific B_d^0 , B_s^0 analyses:

➤ Reconstruction of $B_d^0 \rightarrow D^{(*)} X$, $B_s^0 \rightarrow D_s X$

➤ With or without flavor-tagging at production

DO, Phys. Rev. D 86 072009 (2012)
DO, Phys. Rev. Lett. 110, 011801 (2013)
LHCb, LHCb-CONF-2012-022 (2012)
BaBar, arXiv:1305.1575 (2013)

Detector-related Asymmetries

- Current statistical precision of the experiments $<0.5\%$ requires very good control of spurious charge asymmetries from:
 - Charge-asymmetric BKG: hadrons misidentified as leptons & leptons from light hadron decays (e.g. positive kaons have smaller interaction cross-section than negative kaons in matter)
 - Track reconstruction and lepton identification (detector anisotropy could affect efficiencies)
- **Most crucial point of the analyses and biggest systematic uncertainty**
- Effect reduced by inverting magnets polarities (D0, LHCb)
- Estimated on control samples (D0, LHCb) or determined directly in the fit to A_{SL} (BaBar)

Inclusive dilepton Analyses

- ✦ **DO:** “Measurement of the anomalous like-sign dimuon charge asymmetry with 9 fb^{-1} of $p\bar{p}$ collisions”, (9 fb^{-1})
Phys. Rev. D 84, 052007, 2011

Do like-sign dimuons charge Asymmetry

Phys. Rev. D 84,052007 (2011)

• Semileptonic asymmetry A_{SL}^b measured from inclusive single muon & like-sign dimuon charge asymmetries:

$$a = \frac{n(\mu^+) - n(\mu^-)}{n(\mu^+) + n(\mu^-)}$$

Only 3% of single muons from decays of mixed B^0_q

$$A = \frac{N(\mu^+ \mu^+) - N(\mu^- \mu^-)}{N(\mu^+ \mu^+) + N(\mu^- \mu^-)}$$

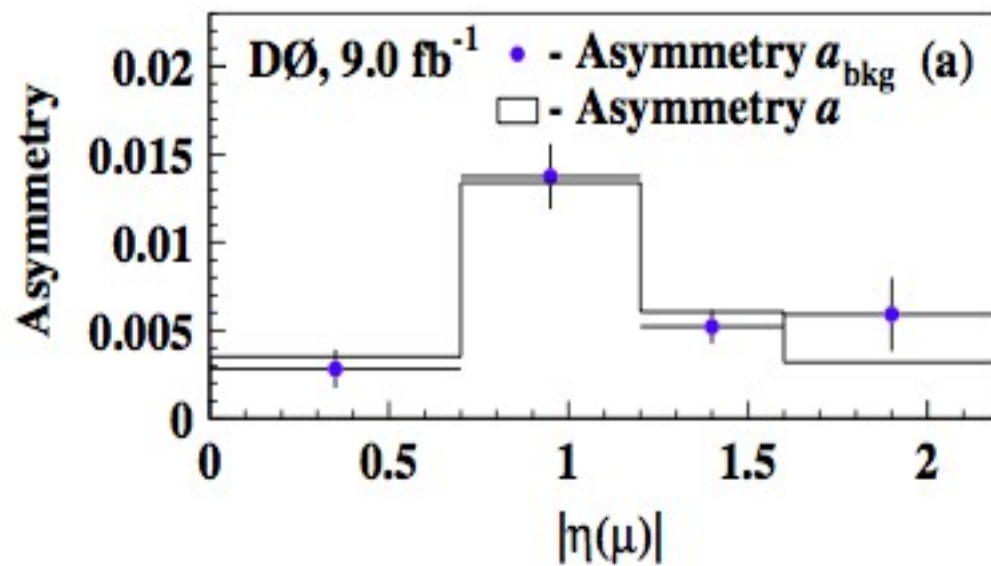

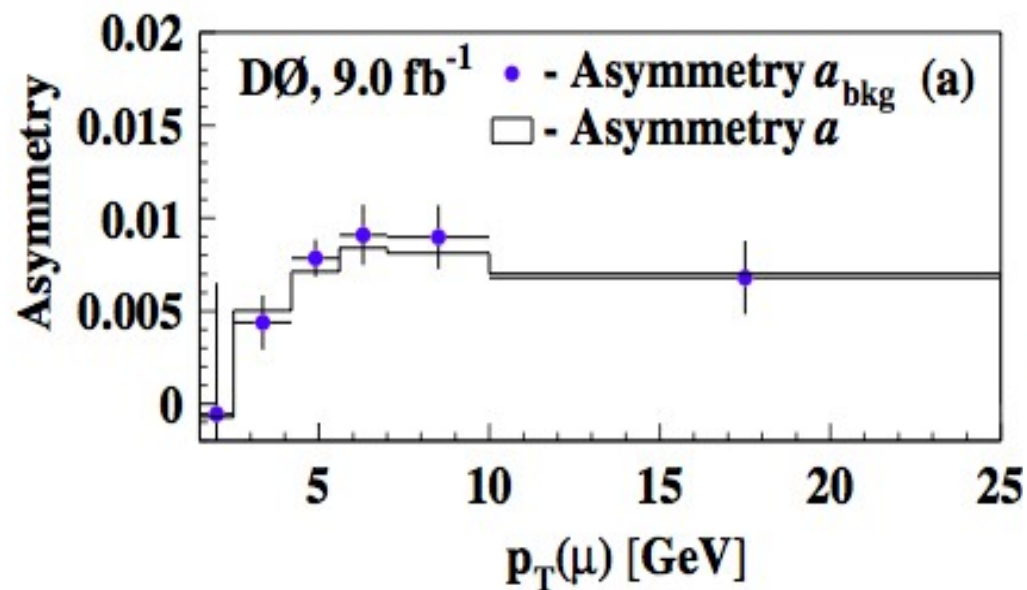

Only 30% of equal-charge muons from decays of mixed B^0_q

- Challenge: understand contributions from:
- Muons from other b decays, charm and short-lived hadrons
 - Detector-related charge asymmetries

Do like-sign dimuons charge Asymmetry

Phys. Rev. D 84,052007 (2011)

- BKG fractions and asymmetries from $K, p, \pi \rightarrow \mu$ determined using $K^{*0} \rightarrow K^+\pi^-, \Phi \rightarrow K^+K^-, K_S^0 \rightarrow \pi^+\pi^-, \Lambda \rightarrow p\pi^-$ control samples
- Observed single muon asymmetry agrees with BKG expectations:

- From the inclusive muon sample alone:

$$A_{SL}^b = (-1.04 \pm 1.30(\text{stat}) \pm 2.31(\text{syst}))\%$$

Agrees with SM

Do like-sign dimuons charge Asymmetry

Phys. Rev. D 84,052007 (2011)

● Observed like-sign dimuon asymmetry differs significantly from expectations

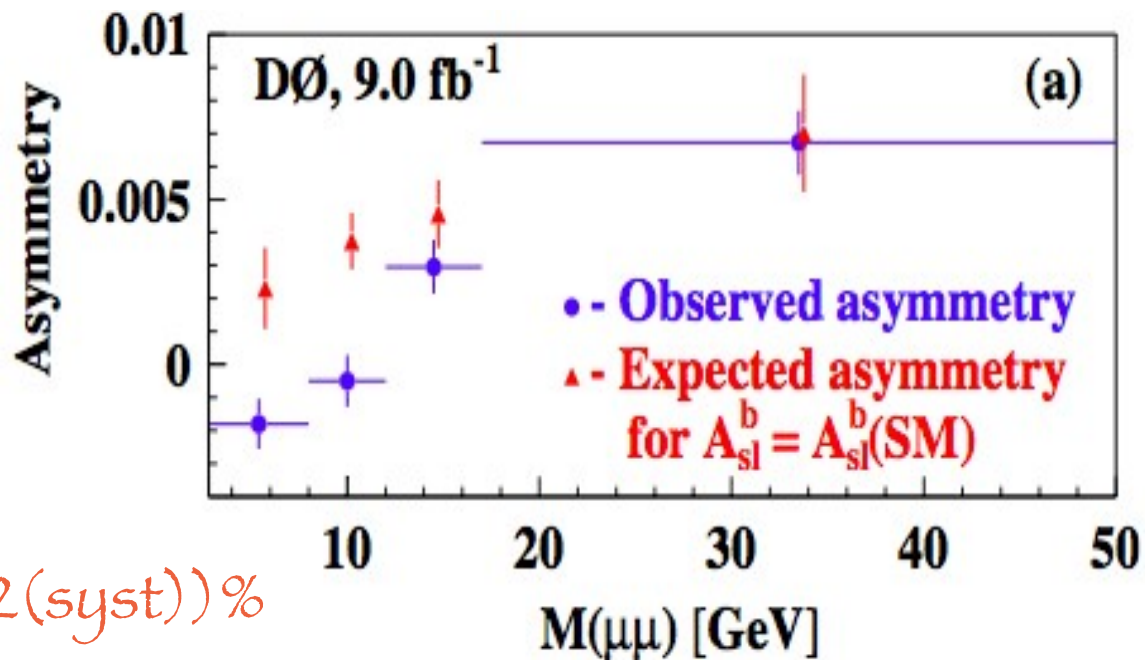

● From the dimuon sample alone:

$$A_{SL}^b = (-0.808 \pm 0.202(\text{stat}) \pm 0.222(\text{syst}))\%$$

● Result obtained using a linear combination of single lepton and dilepton asymmetries to reduce uncertainty:

$$A_{SL}^b = (-0.787 \pm 0.172(\text{stat}) \pm 0.093(\text{syst}))\%$$

✦ Systematics dominated by BKG fraction determination

3.9 σ from SM prediction:

Do like-sign dimuons charge Asymmetry

Phys. Rev. D 84,052007 (2011)

- Mixed $B^0_{(s)}$ fractions depend on muon Impact Parameter

- A_{SL}^b computed in the two regions:
 $IP > 120 \mu\text{m}$, $IP < 120 \mu\text{m}$

- Allows separate determination of

$$A_{SL}^d = (-0.12 \pm 0.52) \%$$

$$A_{SL}^s = (-1.81 \pm 1.06) \%$$

Do like-sign Asymmetry: Interpretation

Borissov, Hoeneisen, Phys. Rev. D 87, 074020 (2013)

- Results do not agree with SM only in dimuon charge asymmetry
 - Search for any neglected source of CP violation which could affect the dimuon asymmetry leaving the single muon one uninfluenced
- $B^0(\bar{B}^0) \rightarrow c\bar{c}d\bar{d}$ final states (e.g. D^+D^-) accessible from both B^0 and \bar{B}^0
 - Interference of decays with and without mixing results in CP violation which affects only the dilepton charge asymmetry:

$$A(c\bar{c}d\bar{d}) = -\sin(2\beta) \frac{x_d}{1+x_d^2} \omega(c\bar{c}d\bar{d}) = (-0.045 \pm 0.016) \%, \quad x_d = \frac{\Delta m_d}{\Gamma_d}$$

Contribution of the $c\bar{c}d\bar{d}$ channels in the inclusive dimuon sample

- Discrepancy with SM in like-sign asymmetry lowered from 2.8σ to 2.3σ
- Mandatory to perform measurements of flavor specific asymmetries

Flavor Specific Analyses

● **DO**: “Measurement of the semileptonic charge asymmetry in B^0 meson mixing with the DO detector” (10.4 fb^{-1})

Phys. Rev. D 86 072009 (2012)

● **DO**: “Measurement of the Semileptonic Charge Asymmetry using $B_s^0 \rightarrow D_s \mu X$ ” (10.4 fb^{-1})

Phys. Rev. Lett. 110, 011801 (2013)

● **LHCb**: “Measurement of the flavour-specific CP violating asymmetry A_{SL}^s in B_s^0 decays” (1.0 fb^{-1})

LHCb-CONF-2012-022 (2012), Preliminary

● **BaBar**: “Search for CP Violation in $B^0 \bar{B}^0$ Mixing using Partial Reconstruction of $B^0 \rightarrow D^* X \ell \nu$ and a Kaon Tag” (425.7 fb^{-1})

ArXiv: 1305.1575 (2013), Submitted to Phys. Rev. Lett.

Do Flavor Specific $A_{SL}^{d,s}$

Phys. Rev. D 86 072009 (2012), Phys. Rev. Lett. 110, 011801 (2013)

● Flavor specific asymmetries $A_{SL}^{d,s}$ measured using exclusive decay channels of $B^0_{(s)}$ mesons:

$$\oplus B^0 \rightarrow D^- \chi \mu^+ \nu \quad (D^- \rightarrow K^+ \pi^- \pi^-),$$

$$B^0 \rightarrow D^{*-} \chi \mu^+ \nu \quad (D^{*-} \rightarrow \bar{D}^0 \pi^-, \bar{D}^0 \rightarrow K^+ \pi^-)$$

$$\oplus B^0_s \rightarrow D^-_s \chi \mu^+ \nu \quad (D^-_s \rightarrow \Phi \pi^-, \Phi \rightarrow K^+ K^-)$$

$$A_{SL}^{d,s} = \frac{A - A_{BKG}}{F_{B^0(s)}^{osc}}, \quad A = \frac{N_{\mu^+ D^-} - N_{\mu^- D^+}}{N_{\mu^+ D^-} + N_{\mu^- D^+}}$$

No flavor-tagging
at production

● A : Measured raw asymmetry

● A_{BKG} : Detector-related asymmetry

● $F_{B^0(s)}^{osc}$: Fraction of signal events originating from oscillated $B^0_{(s)}$

● Assumption: no production asymmetry & no direct CPV in charged D-mesons or in B semileptonic decays

Do Flavor Specific $A_{SL}^{d,s}$

Phys. Rev. D 86 072009 (2012), Phys. Rev. Lett. 110, 011801 (2013)

- Fraction of signal from oscillated $B^0_{(s)}$ computed on MC
- B^0 and B^0_s have different oscillation frequencies
- Different $F_{B^0(s)}^{osc}$ dependence on $B^0_{(s)}$

Visible Proper Decay Length

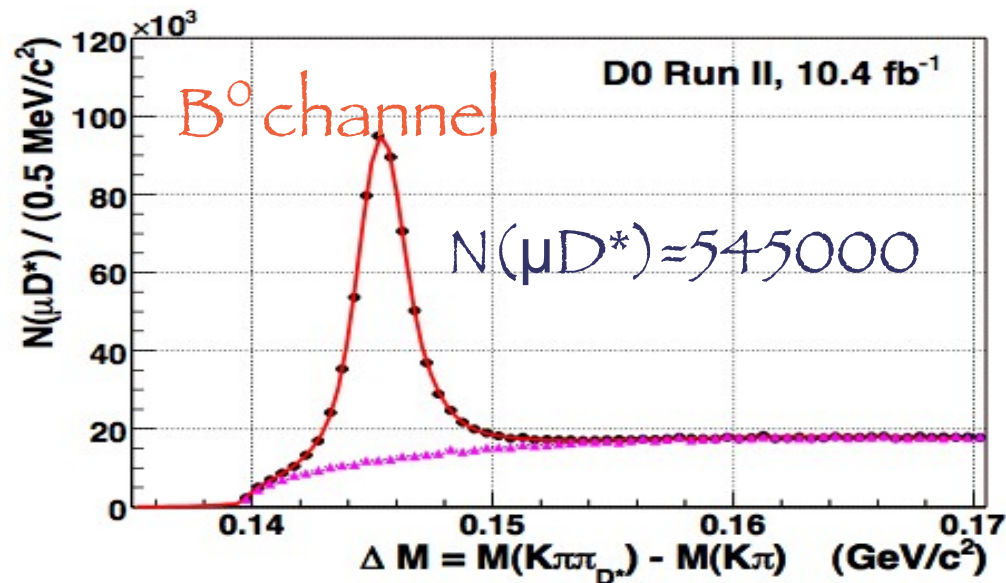

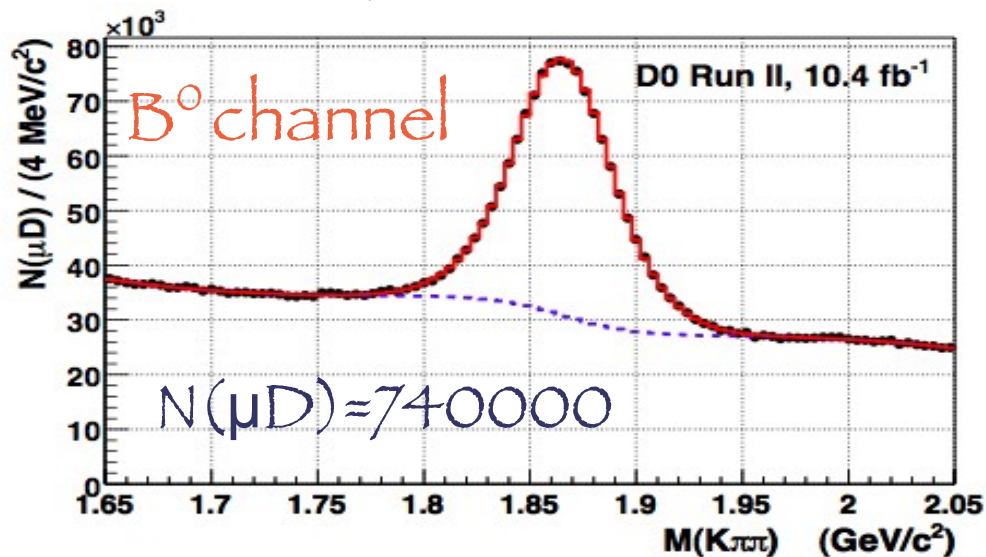

- Analysis optimized in the different VPDL bins for B^0 decays
- Time integrated analysis used for B^0_s

- Control sample:
- Expect $A - A_{BKG} = 0$

D0 Flavor Specific $A_{d,s}^{d,s}$ SL

Phys. Rev. D 86 072009 (2012), Phys. Rev. Lett. 110, 011801 (2013)

- Selection optimized by means of multivariate discriminants

- Several variables used: D transverse decay length, track isolation, B candidate mass, ...
- Final cuts chosen to maximize signal significance

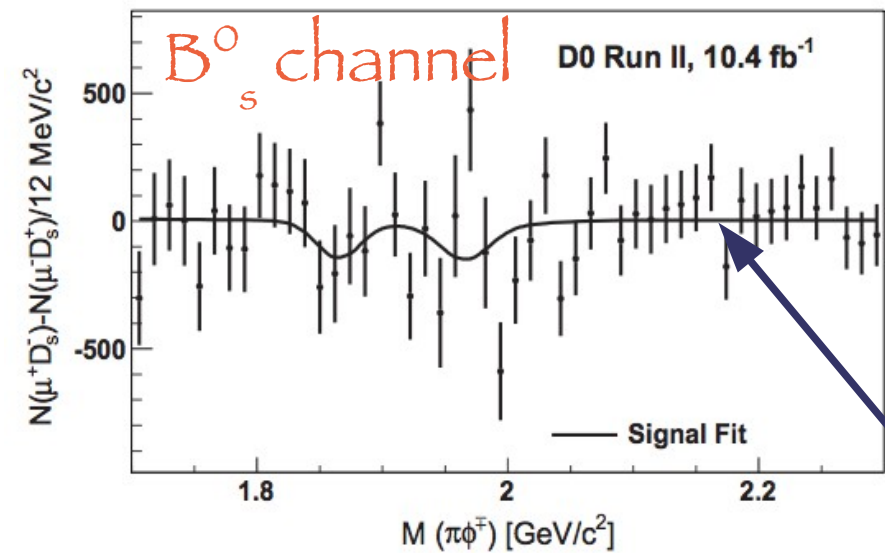

D0 Flavor Specific $A^{d,s}_{SL}$

Phys. Rev. D 86 072009 (2012), Phys. Rev. Lett. 110, 011801 (2013)

● Raw asymmetry obtained from simultaneous fits to the sum and difference of signal μ^+D^- and μ^-D^+ distributions:

$$F_{sum} = F_{sum}^{BKG} + N_{sum} F_{sig}$$

$$F_{dif} = F_{dif}^{BKG} + A N_{sum} F_{sig}$$

● B^0 : $A = (1.48 \pm 0.41)\%$

➤ Significant asymmetry due to kaon identification

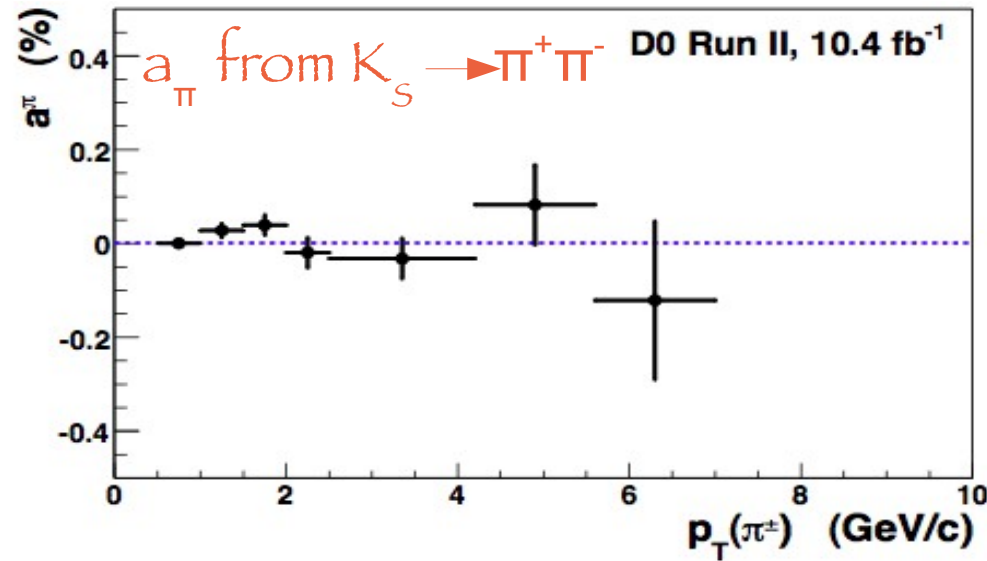

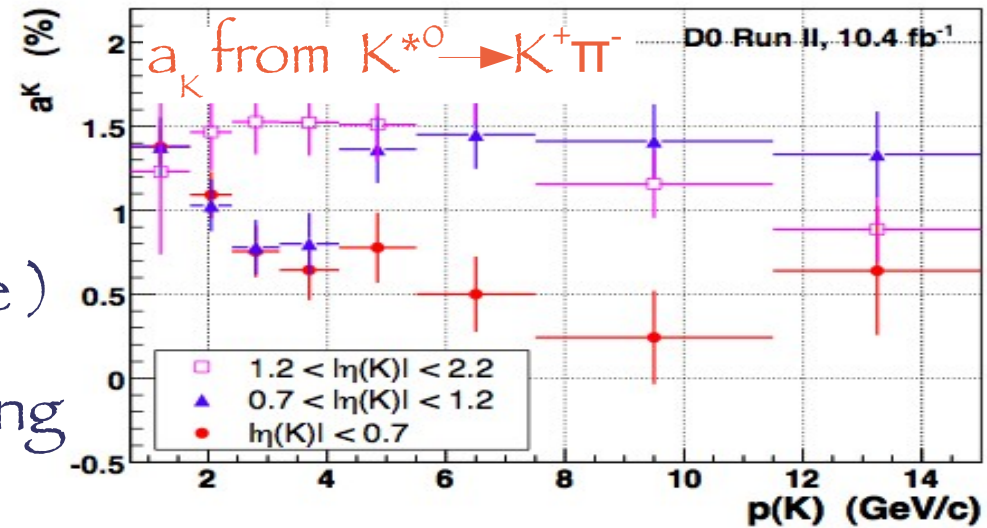

● B^0_s : $A = (-0.40 \pm 0.33)\%$

➤ Negligible asymmetry in Side Bands:
Small track reconstruction effect

D0 Flavor Specific $A_{SL}^{d,s}$

Phys. Rev. D 86 072009 (2012), Phys. Rev. Lett. 110, 011801 (2013)

- BKG asymmetries computed on control samples
- Dominated by kaon reconstruction (B_s^0 unaffected due to K^+K^- final state)
- Detector effects reduced by reversing magnets polarities every two weeks

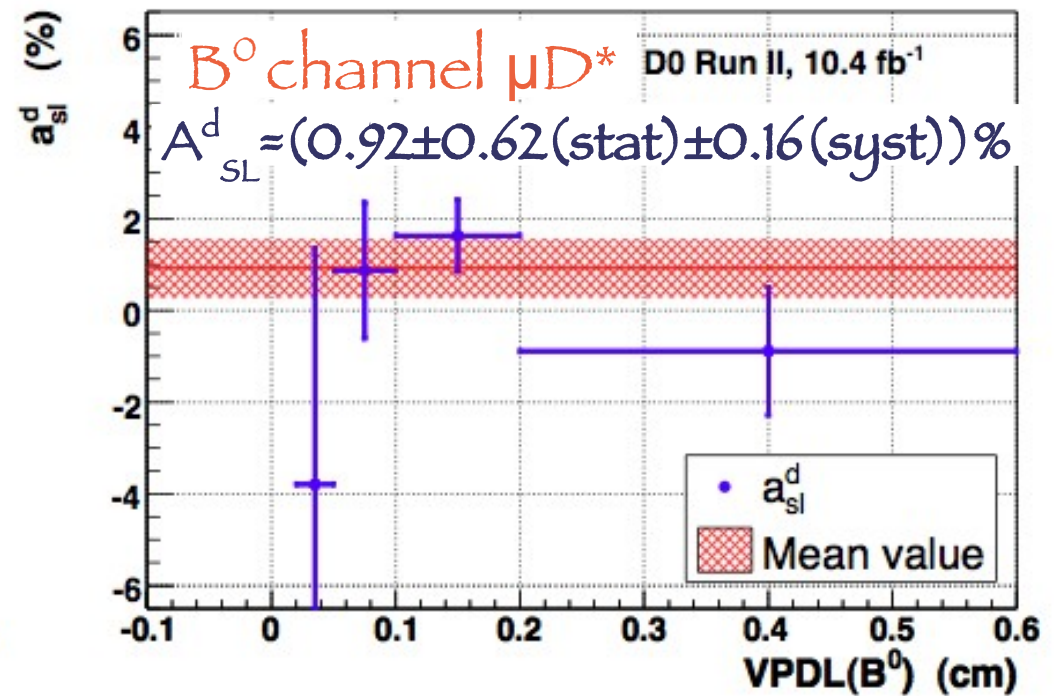

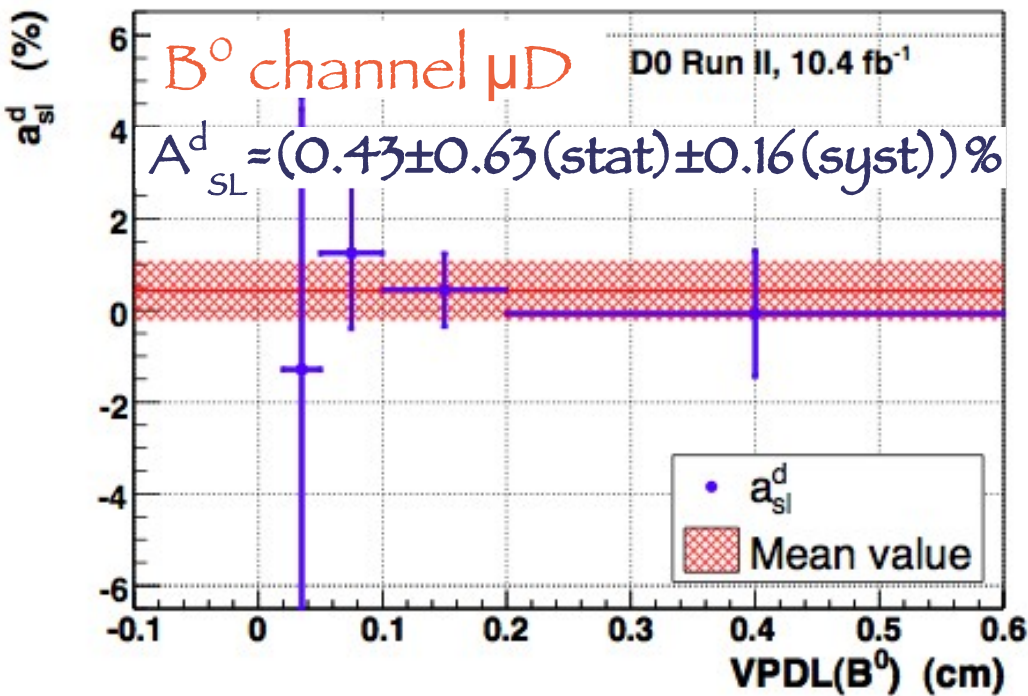

✦ $A_{BKG}(B^0) = (1.18-1.27)\%$ depending on VPDL bin, $A_{BKG}(B_s^0) = (0.13 \pm 0.06)\%$

D0 Flavor Specific $A_{SL}^{d,s}$

Phys. Rev. D 86 072009 (2012), Phys. Rev. Lett. 110, 011801 (2013)

Results:

$$\blacktriangleleft A_{SL}^d = (0.68 \pm 0.45 \text{ (stat)} \pm 0.14 \text{ (syst)}) \%$$

$$\blacktriangleleft A_{SL}^s = (-1.12 \pm 0.74 \text{ (stat)} \pm 0.17 \text{ (syst)}) \%$$

In agreement
with SM

\blacktriangleleft Systematics dominated by BKG asymmetries and $F_{B^0(s)}^{osc}$

LHCb Flavor Specific A_{SL}^s

LHCb-CONF-2012-022 (2012)

- Flavor specific asymmetry A_{SL}^s measured from exclusive decay:

$$A_{meas} = \frac{\Gamma[D_s^- \mu^+] - \Gamma[D_s^+ \mu^-]}{\Gamma[D_s^- \mu^+] + \Gamma[D_s^+ \mu^-]} = \frac{A_{SL}^s}{2} + \left[a_p - \frac{A_{SL}^s}{2} \right] \frac{\int_{t=0}^{\infty} e^{-\Gamma_s t} \cos(\Delta M_s t) \epsilon(t) dt}{\int_{t=0}^{\infty} e^{-\Gamma_s t} \cosh \frac{\Delta \Gamma_s t}{2} \epsilon(t) dt}$$

- A_{meas} : Measured asymmetry corrected for detector effects

- $a_p = \frac{N - \bar{N}}{N + \bar{N}}$: Production asymmetry (o(1%))

- $\epsilon(t)$: Decay time acceptance

Acceptance integral ratio o(0.2%)

- Production asymmetry effect negligible due to fast B_s^0 oscillation

LHCb Flavor Specific A_{SL}^s

LHCb-CONF-2012-022 (2012)

- Time integrated raw asymmetry corrected for detector effects:

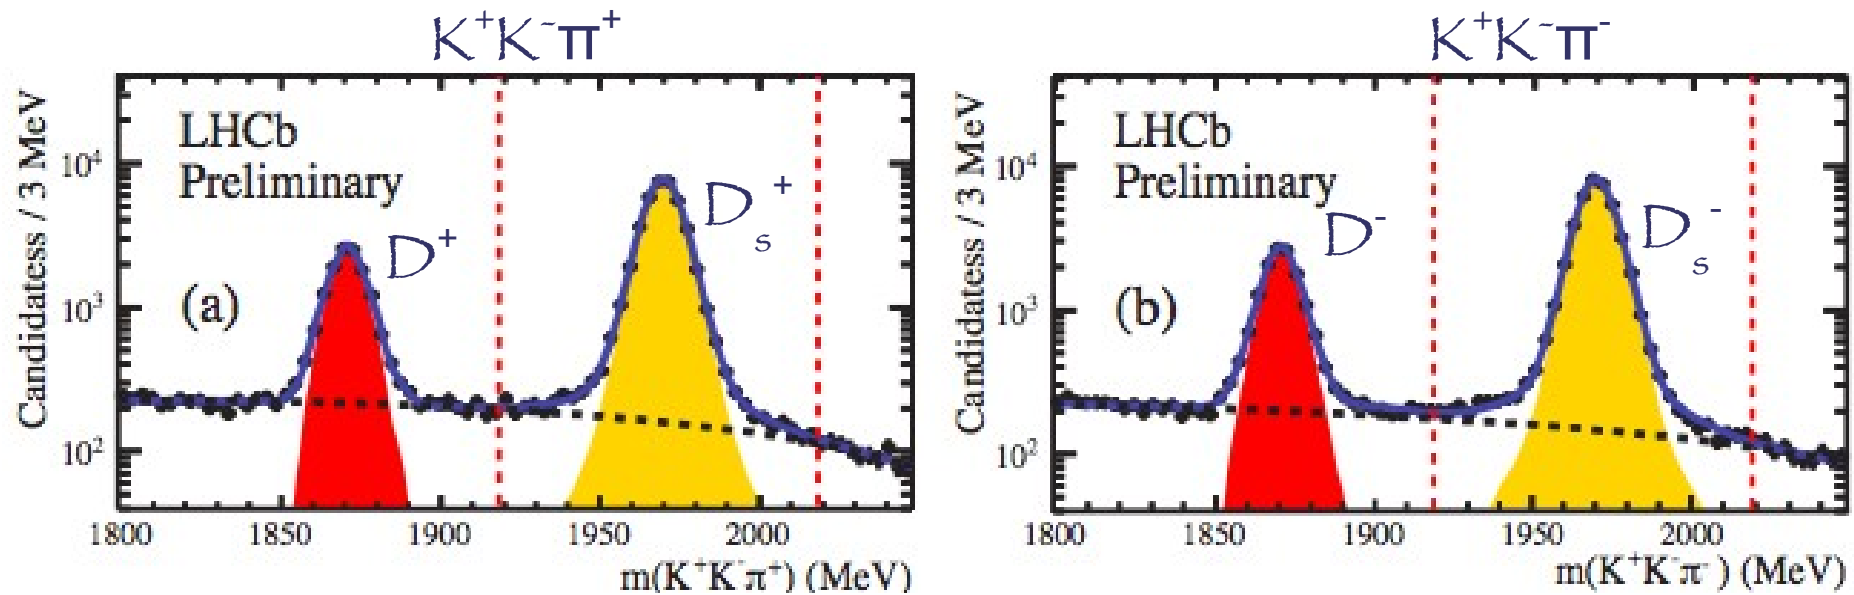

$$A_{\text{meas}} = \frac{N(D_s^- \mu^+) - N(D_s^+ \mu^-) \times \frac{\epsilon(D_s^- \mu^+)}{\epsilon(D_s^+ \mu^-)}}{N(D_s^- \mu^+) + N(D_s^+ \mu^-) \times \frac{\epsilon(D_s^- \mu^+)}{\epsilon(D_s^+ \mu^-)}}$$

- Detector effects reduced by periodically reversing magnets polarities
- Tracking asymmetry mostly cancels between π & μ in the $\Phi\pi\mu^+$ sample
- Relative efficiencies computed on calibration samples:
 - Track efficiency ratio $\epsilon(\pi^+)/\epsilon(\pi^-)$ from ratio of fully reconstructed and partially reconstructed $D^{*+} \rightarrow D^0\pi^+$, $D^0 \rightarrow K^-\pi^+\pi^-(\pi^+)$
 - Muon efficiency ratio $\epsilon(\mu^+)/\epsilon(\mu^-)$ from $J/\Psi \rightarrow \mu^+\mu^-$ using a tag and probe method

LHCb Flavor Specific A_{SL}^s

LHCb-CONF-2012-022 (2012)

- Signal yields extracted from $KK\pi$ invariant mass distributions

- Background asymmetries due to $K, \pi \rightarrow \mu$ misidentification, prompt $D_s, B \rightarrow D_s X_c, D_s K\mu\nu X \sim \mathcal{O}(10^{-4})$

- Negligible effect on the result
- BKG not subtracted from the selected events
- Taken into account in the systematic error evaluations

LHCb Flavor Specific A_{SL}^s

LHCb-CONF-2012-022 (2012)

Corrected asymmetries vs P_μ :

$$A_{SL}^s = (-0.24 \pm 0.54 \text{ (stat)} \pm 0.33 \text{ (syst)}) \%$$

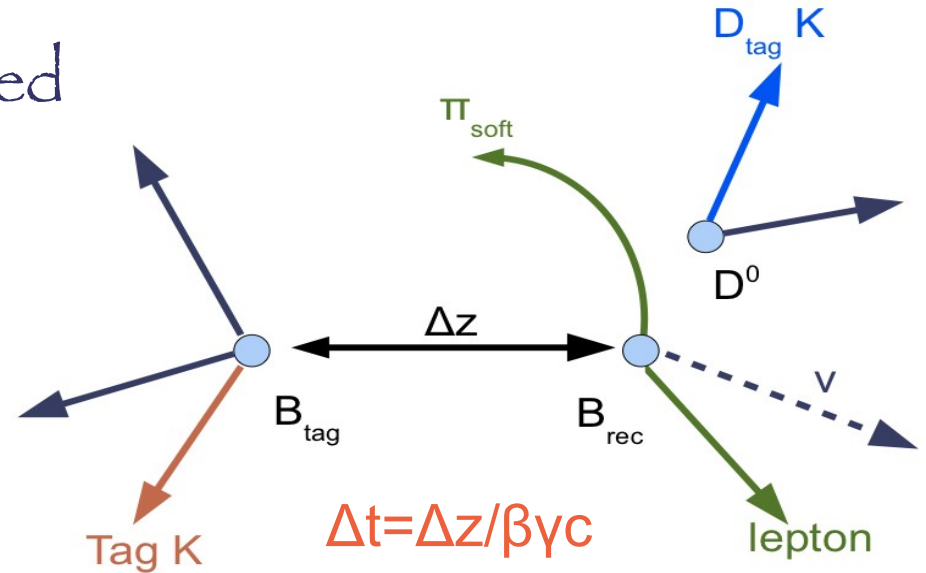

Systematics dominated by statistical error on the muon efficiency ratio $\epsilon(\mu^+)/\epsilon(\mu^-)$

In agreement with SM

BaBar Flavor Specific A_{SL}^d

arXiv:1305.1575 (2013)

- B^0 Semileptonic Asymmetry measured from Partially Reconstructed $B^0 \rightarrow D^* \ell \nu$, $D^* \rightarrow \pi_{\text{soft}} D^0$ and K Tag

- P.R. B^0 flavor from lepton charge

- Tag B^0 flavor from K charge

- Tag B vertex from K track extrapolation to the e^+e^- Interaction Region

$$A_{SL}^d \approx \frac{N(\ell^+ K_T^+) - N(\ell^- K_T^-)}{N(\ell^+ K_T^+) + N(\ell^- K_T^-)}$$

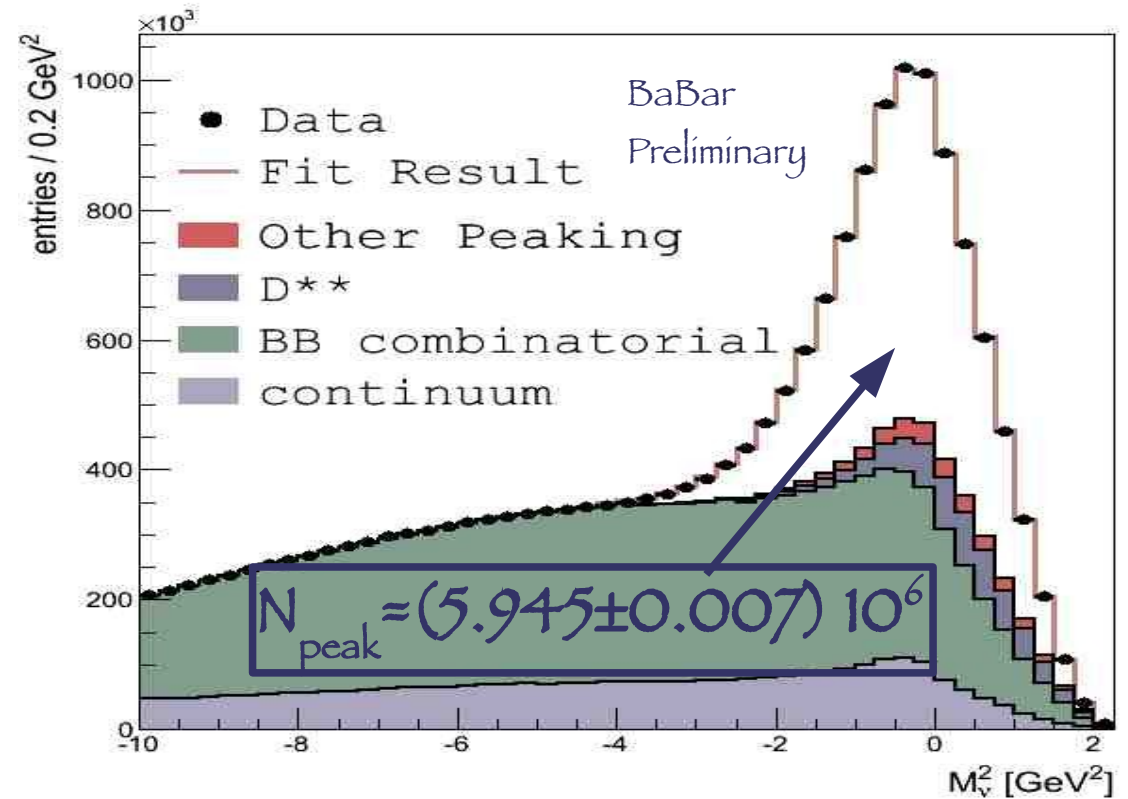

- A_{SL}^d from an Extended Maximum Likelihood binned fit to the Δt & $\cos(\theta_{\text{K-Lepton}})$ distributions of the 4 subsamples:

Unmixed ($\ell^- K^+$, $\ell^+ K^-$); Mixed ($\ell^+ K^+$, $\ell^- K^-$)

BaBar Flavor Specific A_{SL}^d

arXiv:1305.1575 (2013)

- Reconstruct only lepton & π_{soft} with opposite charge
- Signal selection using missing squared neutrino mass with the approximation of B^0 at rest in the $Y(4s)$ frame
- D^* 4-momentum estimated from π_{soft} kinematics

$$M_\nu^2 \equiv (E_{\text{beam}} - E_{D^*} - E_\ell)^2 - (\vec{p}_{D^*} + \vec{p}_\ell)^2$$

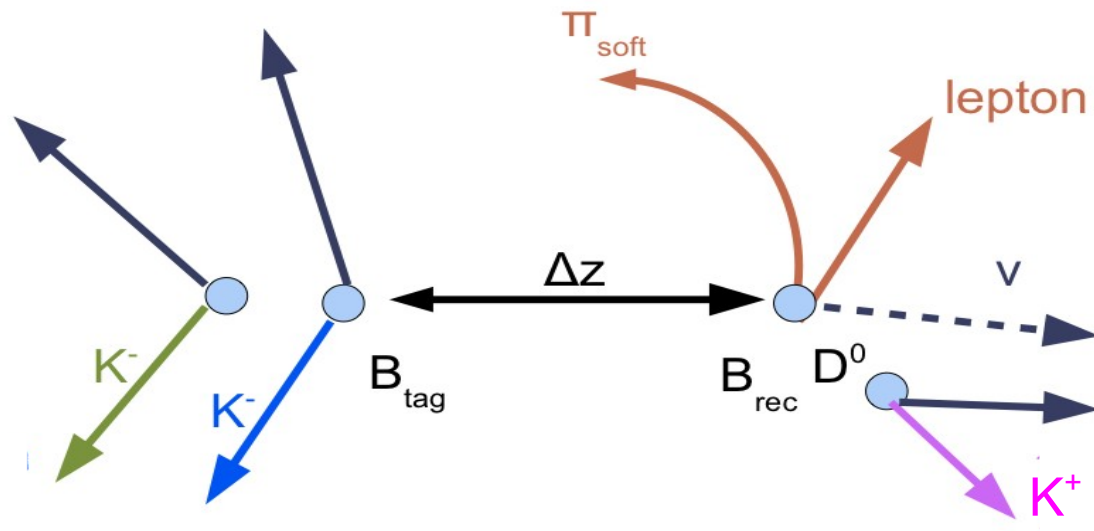

- Sample composition from a fit to M_ν^2 by floating D^* , D^{**} and Combinatorial using MC shapes and Continuum shape from Off-Peak events

BaBar Flavor Specific A_{SL}^d

arXiv:1305.1575 (2013)

● Tagging Kaon Sample: $\begin{cases} b \rightarrow K + b \rightarrow c \rightarrow K \\ D^0 \rightarrow K \end{cases}$

From Tag B	"Btag"
From Reco B	"Dtag"

Tag Kaon
Tag Side
"Btag"

"Dtag" Decay Side
mostly populate the "Mixed"
event sample (K-lepton charge
correlation)

BaBar Flavor Specific A_{SL}^d

arXiv:1305.1575 (2013)

● Crucial Issue: discriminate between Physical & Detector charge asymmetry without relying on control samples

➤ Reconstruction Asymmetry:

$$\rho = \epsilon(l^+, \pi^-), \bar{\rho} = \epsilon(l^-, \pi^+)$$

$$A_{rec} = (\rho - \bar{\rho}) / (\rho + \bar{\rho})$$

➤ Tagging Asymmetry, depending on P_K :

$$\tau = \epsilon(K^+), \bar{\tau} = \epsilon(K^-)$$

$$A_{tag} = (\tau - \bar{\tau}) / (\tau + \bar{\tau})$$

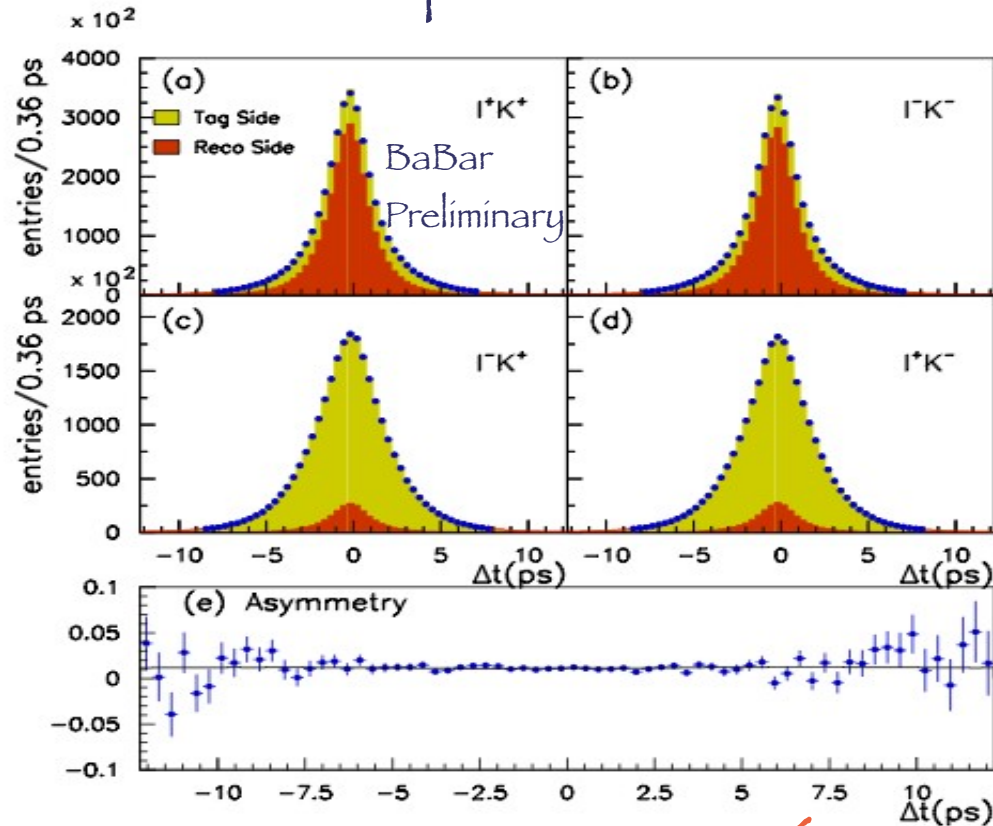

● Different sub-samples (B^0, B^+) \times (Peaking, BKG) \times (Btag, Dtag) share Physical and/or Detector asymmetries in different combinations.

● Strategy: disentangle the Physical and Detector asymmetries by exploiting all the available informations from different sub-samples.

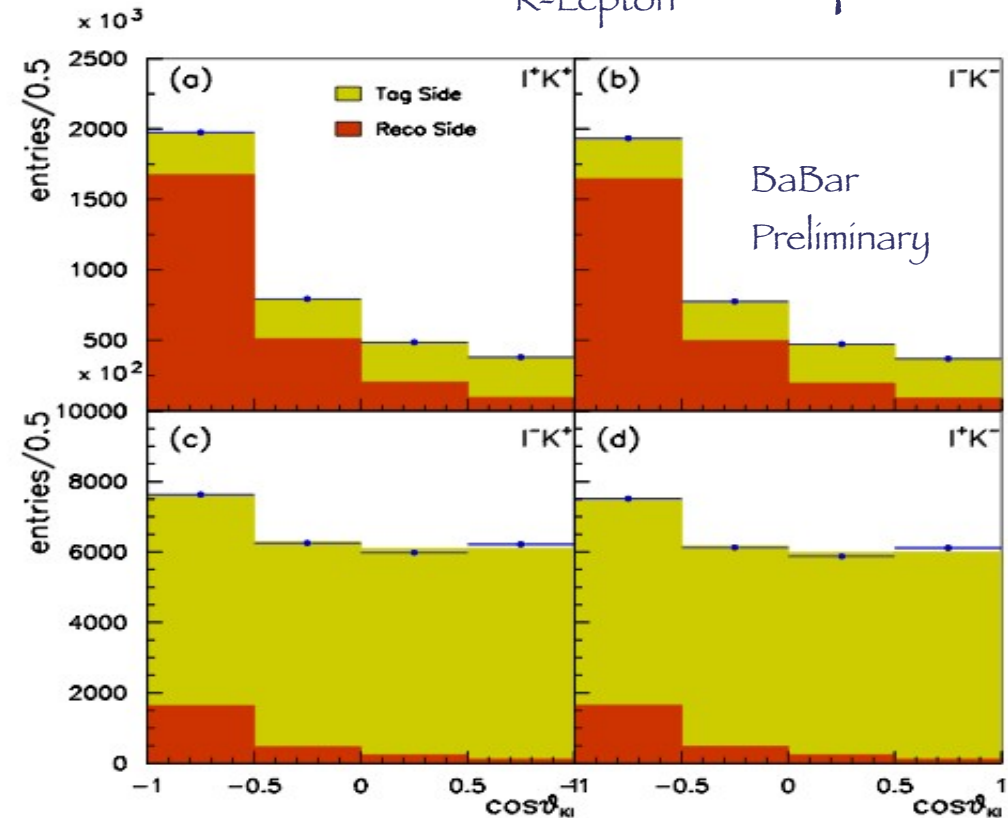

BaBar Flavor Specific A_{SL}^d

arXiv:1305.1575 (2013)

Fitted Δt Shapes

Fitted $\cos(\theta_{K\text{-Lepton}})$ Shapes

$$|q/p|-1 = \begin{pmatrix} -0.29 \pm 0.84 & +1.61 \\ & -1.78 \end{pmatrix} \times 10^{-3} \Rightarrow A_{SL}^d = (0.06 \pm 0.17 \begin{matrix} +0.38 \\ -0.32 \end{matrix}) \%$$

Systematics dominated by uncertainty on sample composition

Best single Measurement, in agreement with SM

Conclusions

Combination of Results

Iain Bertram – DIS 2013

- Results from flavor specific measurements:

- A_{SL}^d :

- $\oplus Y(4S) = (0.02 \pm 0.31) \%$

- $\oplus Y(4S) + D0 = (0.23 \pm 0.26) \%$

- A_{SL}^s :

- $\oplus D0 + LHCb = (-0.60 \pm 0.49) \%$

World averages of flavor specific measurements agree with SM

World Average

● HFAG averages (after CKM2012)

(http://www.slac.stanford.edu/xorg/hfag/osc/fall_2012/#CPV)

● From a 2-D fit to $A_{SL}^{d,s}$:

● A_{SL}^d (world) = $(-0.03 \pm 0.21) \%$

● A_{SL}^s (world) = $(-1.09 \pm 0.40) \%$

● World average of experimental results deviates 2.4σ from SM prediction

Constraints on New Physics

- New Physics could modify M_{12}^q and A_{SL} leaving Γ_{12}^q unchanged

(Lenz et al., Phys. Rev. D 86, 033008 (2012),
Nierste, arXiv:1212.5805 (2012))

$$M_{12}^{NP,q} = M_{12}^{SM,q} \Delta_q; \Delta_q = |\Delta_q| e^{i\phi_q^\Delta}$$

$$\Delta_q^{SM} = 1$$

$$A_{SL}^{NP} = \frac{|\Gamma_{12}^q|}{|M_{12}^{SM,q}|} \frac{\sin(\phi_q^{SM} + \phi_q^\Delta)}{|\Delta_q|}$$

- New phases ϕ_q^Δ would shift also the CP phases from the mixing-induced CP asymmetries:

$$\rightarrow B^0 \rightarrow J/\psi K_S: 2\beta \rightarrow 2\beta + \phi_d^\Delta$$

$$\rightarrow B_s^0 \rightarrow J/\psi \Phi: 2\beta_s \rightarrow 2\beta_s - \phi_s^\Delta$$

- Strong constraint from recent LHCb $B_s^0 \rightarrow J/\psi \Phi$ measurement:

$$\rightarrow 2\beta_s - \phi_s^\Delta = (0.1 \pm 5.8 \pm 1.5)^\circ \quad (\text{LHCb-CONF-2012-002})$$

$$(2\beta_s = 2 \arg(-V_{ts} V_{tb}^* / V_{cs} V_{cb}^*) \simeq 2.1^\circ)$$

Constraints on New Physics

Global fit of $\Delta_{d,s}$ and CKM elements performed to all relevant data

(Nierste, arXiv:1212.5805 (2012), CKMfitter Group (J. Charles et al.), <http://ckmfitter.in2p3.fr>):

- Average still not includes recent D0 & BaBar flavor specific results
- Due to LHCb constraint on ϕ_s^Δ , SM prediction disfavored by only 1σ
- Difficult to accommodate the D0 inclusive A_{SL} result in this framework

Conclusions

- CP violation in $B^0_{(s)}$ mixing is an excellent laboratory for the search for physics beyond the Standard Model
- In the last two years, five new measurements from B-Factories & Hadron Colliders released with experimental precision $\sim 0.5\%$:
 - agreement with SM is improving
- In the Near Future:
 - BaBar is finalizing the inclusive B^0 dilepton asymmetry with the full statistics & a single tag measurement using $B^0 \rightarrow D^* l \nu$ P.R.
 - LHC experiments & Belle II will offer the Opportunity to:
 - provide very stringent SM tests
 - **Hopefully discover/understand New Physics**

Backup

Do like-sign dimuons charge Asymmetry

Phys. Rev. D 84,052007 (2011)

$$a = \frac{n(\mu^+) - n(\mu^-)}{n(\mu^+) + n(\mu^-)} = F(a_S, \delta, a_{BKG}), \quad a_s = c_b A_{SL}^b$$

$$A = \frac{N(\mu^+ \mu^+) - N(\mu^- \mu^-)}{N(\mu^+ \mu^+) + N(\mu^- \mu^-)} = G(A_S, \delta, A_{BKG}), \quad A_S = C_b A_{SL}^b$$

- a_S, A_S : Asymmetries of muons from b, c, and short-lived hadrons
- c_b, C_b : Dilutions computed in terms of the various processes contributing to the BKG-subtracted muon samples:
 - $c_b = 0.061 \pm 0.007, C_b = 0.474 \pm 0.032$
- δ : Muon reconstruction asymmetry
- a_{BKG}, A_{BKG} : Background asymmetries from K, π decays determined using real data control samples

Do like-sign dimuons charge Asymmetry

Phys. Rev. D 84,052007 (2011)

- Background asymmetry determined from real data control samples

$$a_{\text{BKG}} = f_K a_{K^+ K^-} + f_\pi a_{\pi^+ \pi^-} + f_p a_{p^+ p^-}$$

- Fractions f_x determined in PT_μ, η_μ bins from

$$K^{*0} \rightarrow K\pi, K_s\pi \quad (K \rightarrow \mu), \quad P(\pi \rightarrow \mu)/P(K \rightarrow \mu), \quad P(p \rightarrow \mu)/P(K \rightarrow \mu)$$

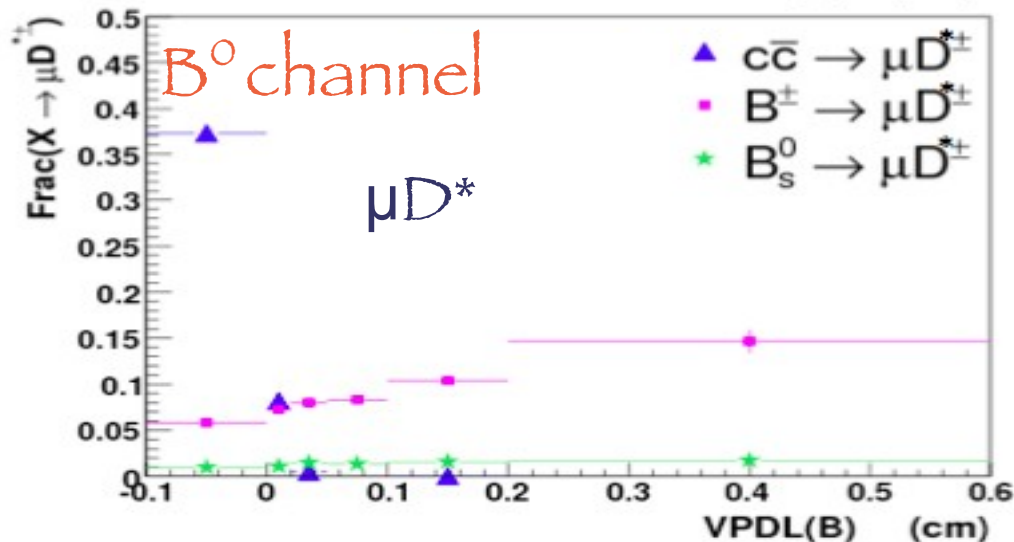

- Asymmetries a_x determined from $K^{*0} \rightarrow K\pi, \Phi \rightarrow KK, K_s \rightarrow \pi\pi$ and $\Lambda \rightarrow p\pi$ requiring an hadron to be identified as a muon

- Muon reconstruction asymmetry from $J/\Psi \rightarrow \mu\mu$ with one identified muon and an additional track with opposite charge

DO Flavor Specific $A_{SL}^{d,s}$

Phys. Rev. D 86 072009 (2012), Phys. Rev. Lett. 110, 011801 (2013)

● Fraction $F_{B^0(s)}^{osc}$ of signal from oscillated $B^0_{(s)}$ computed on MC (EvtGen)

● Fraction of μD candidates from different sources depends on Visible Proper Decay Length

● >80% of signal events from $B^0_{(s)}$ decays

BaBar Flavor Specific A_{SL}^d

arXiv:1305.1575 (2013)

- Signal B^0 Btag PDF for Positive Mixed (l^+K^+) sample, (similar expressions apply for the other ones):

$$\mathcal{F}_{signal}(\Delta t, s_t, s_m) = \frac{\Gamma}{2(1+r'^2)} e^{-\Gamma|\Delta t|} \left| \frac{p}{q} \right|^2 \left[\left(1 + \left| \frac{q}{p} \right|^2 r'^2 \right) \cosh(\Delta\Gamma\Delta t/2) - \left(1 - \left| \frac{q}{p} \right|^2 r'^2 \right) \cos(\Delta m_d \Delta t) + \left| \frac{q}{p} \right| (b+c) \sin(\Delta m_d \Delta t) \right]$$

- r' , b , c : parameters resulting from interference between Cabibbo-Favoured and Doubly Cabibbo-Suppressed decays on the tag side

- Assumed $\Delta\Gamma=0$
- b , c are treated as effective parameters due to strong correlation with resolution function

➤ Only $|q/p|$ is measured

$$\begin{aligned} r' &= \left| \bar{\mathcal{A}}_{DCS} / \mathcal{A}_{CF} \right| \\ b &= 2r' \sin(2\beta + \gamma) \cos \delta' \\ c &= -2r' \cos(2\beta + \gamma) \sin \delta' \\ \delta' &= \text{Strong Phase} \end{aligned}$$

PDF Description: Dtag

- Dominant BKG in Mixed events: *shows single-tag semileptonic asymmetry*

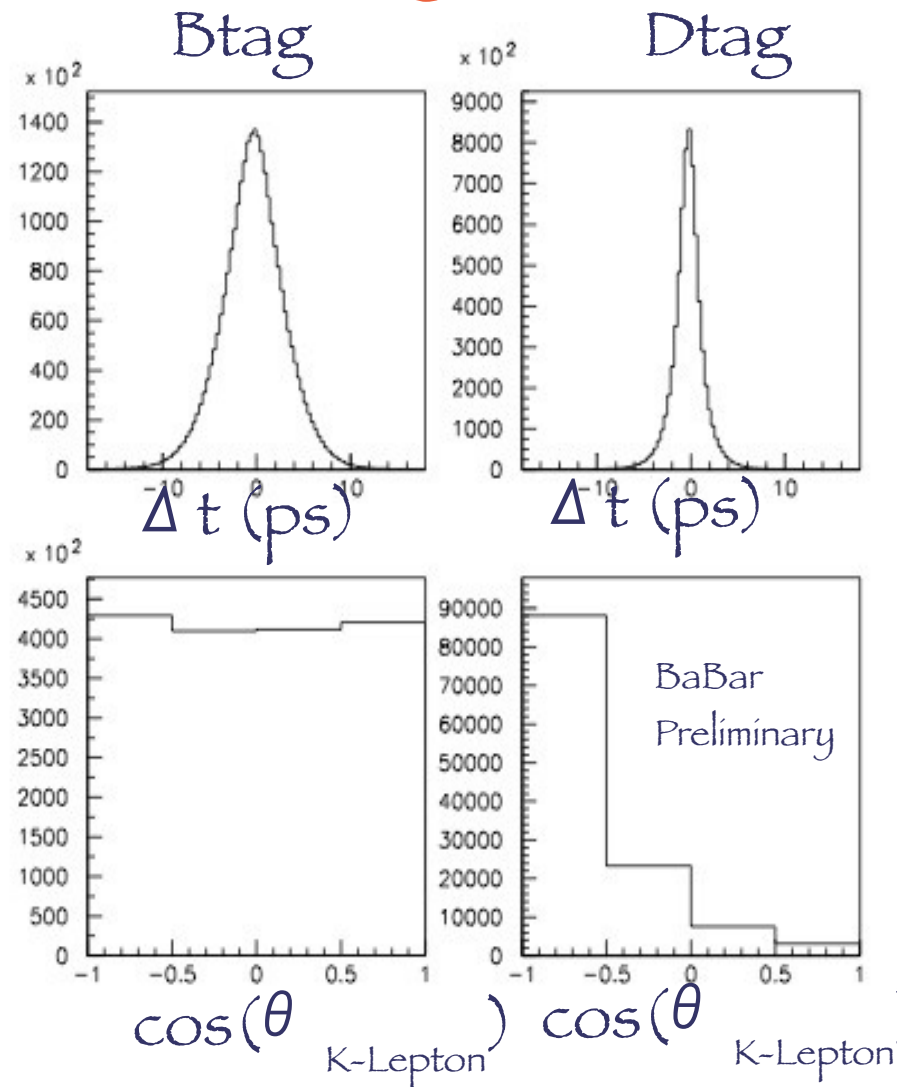

- F_{Dtag} floated by exploiting the different Δt & θ (K-Lepton) distributions wrt Btag events in different P_K bins

- Dtag fraction in B^+ events constrained to B^0 using simulation informations:

$$F_{Dtag}^{B^+} = R_{MC}(P_K) * F_{Dtag}^{B^0}$$

- $\cos(\theta_{K-Lepton})$ PDF from MC

- Δt PDF from a High Purity selection on Real Data (Dtag Purity $\sim 95\%$)

Detector Asymmetry determination

● Observed asymmetry in the different subsamples:

arXiv:1305.1575 (2013)

	B^0	B^+
P.R. evts (Tag+Untag)	$A_{rec} + A_{SL} * X_d$	A_{rec}
Btag	$A_{rec} + A_{tag}(P_K) + A_{SL}$	$A_{rec} + A_{tag}(P_K)$
Dtag	$A_{rec} + A_{tag}(P_K) + A_{SL} * X_d$	$A_{rec} + A_{tag}(P_K)$

X_d : Time-Integrated Mixing Probability

B^+ e Dtag BKG samples are useful in the A_{SL}^d measurement!
