Cosmic Acceleration and outlook for the Future

Successes of the Big Bang model

GR+cosmological principle

Hubble's law

CMB

Abundance of light elements

.. And problems

Flatness problem

Horizon problem

Monopole problem

Origin of perturbations

The flatness problem

$$1 - \Omega = -\frac{c^2 k}{R_0^2 a^2 H^2}$$

Remember Friedmann equations?

today $|1 - \Omega_0| < 0.01$

$$1 - \Omega_0 = -\frac{kc^2}{R_0^2 H_0^2} \quad 1 - \Omega = -\frac{kc^2}{R_0^2 a(t)^2 H(t)^2} = 1 - \Omega(t) = \frac{H_0^2(1 - \Omega_0)}{H^2(t)a^2(t)}$$

For most of the life of the universe: matter+radiation only

$$\frac{H^2}{H_0^2} = \frac{\Omega_{r,0}}{a^4} + \frac{\Omega_{m,0}}{a^3} \quad \longrightarrow \quad 1 - \Omega(t) = \frac{(1 - \Omega_0)a^2}{\Omega_{r,0} + \Omega_{m,0}a}$$

Matter domination $a \sim t^{2/3} \quad 1 - \Omega(t) = \frac{1 - \Omega_0}{\Omega_{m,0}} \left(\frac{t}{t_0}\right)^{2/3}$

Universe was flatter in the past!

Exercise: $@t_{eq}?$ $z_{m,r eq} \sim 3000?$

Radiation dominated $1 - \Omega(t) \sim a^2 \sim t \quad 1 - \Omega(t) = (1 - \Omega(t_{eq})) \frac{t}{t_{eq}}$

Exercise: $@t = 1s?$

Very quickly you find that early on $|1-\Omega| < 10^{-60}$

It is like balancing a pencil on its tip, coming back years later and still finding it balancing on its tip

The Horizon problem

The universe is homogeneous and isotropic on large scales

Consider 2 antipodal points they are separated by $2d_H \sim 30000$ Mpc

$$d_p(t_0) = c \int_{t_{cmb}}^{t_0} \frac{dt}{a(t)} \sim d_H(t_0); \quad t_{cmb} \ll t_0$$

What was the Hubble radius (horizon) back then?

$$H(z)^2 \sim H_0^2 \Omega_{m,0} (1+z)^3 \longrightarrow \frac{c}{H_{z=1000}} \simeq 0.2 \text{ Mpc}$$

Only points at ~ 0.2 Mpc could have “talked”

The last scattering surface can be divided in 40000 patches of degree size I.e. 40000 “horizons”

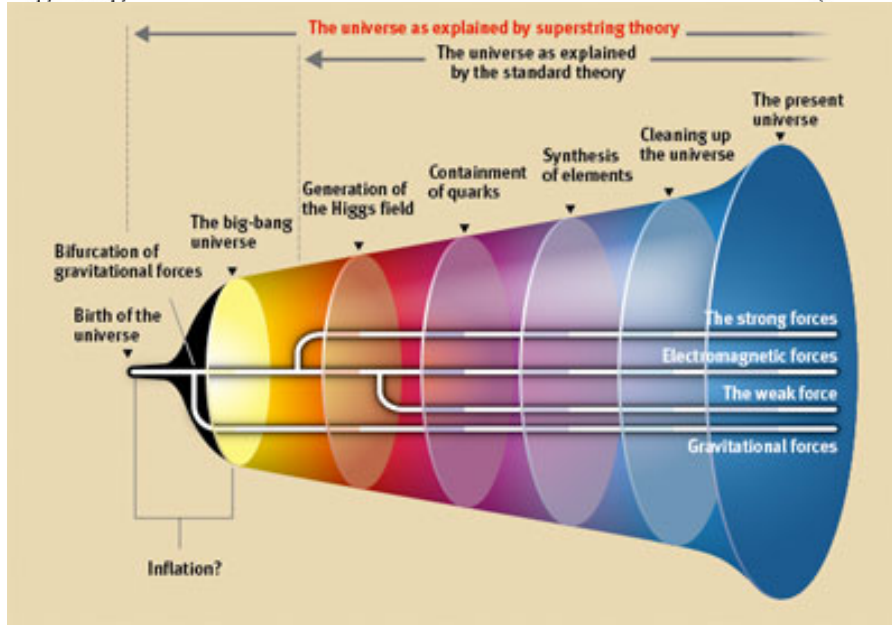

How could they all be at 2.726K?

Imagine 40000 students taking an exam, and all returning THE SAME exam down to the commas...

The monopole problem

Phase transitions
(water freezing,
Magnetization...)

Defects....

Domain walls

Cosmic strings

monopoles

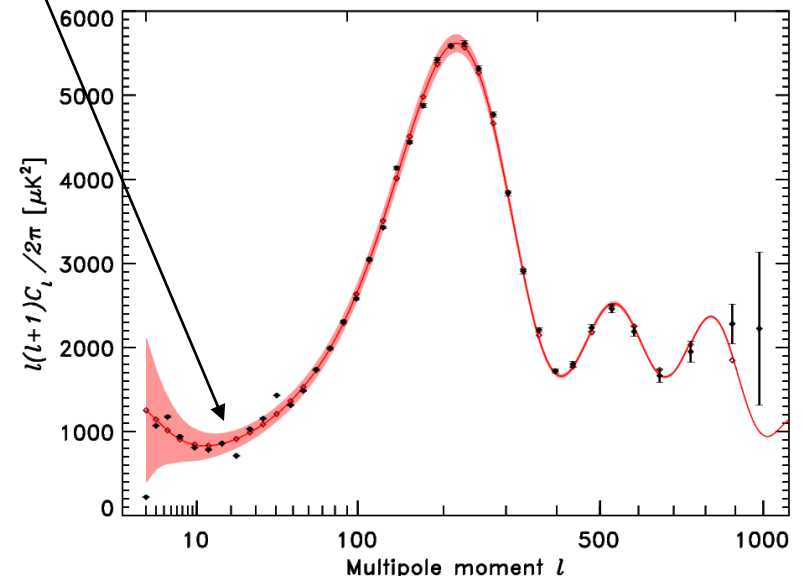

Example from a nematic liquid crystal

The most dangerous ones are the monopoles...

The fact that we are here means that at max there is one monopole in the entire observable universe....

And where the heck these perturbations come from?

INFLATION

To the rescue

Started in the 1980 with A. Guth, active research area.
Still a “paradigm” not a proven fact...

Postulate a period of accelerated expansion
at the very beginning!

Something like a cosmological constant

Different scenarios, particle-physics motivated (?)

Why is the Universe so BIG?

Inflation to the rescue: an accelerated expansion

$$\left(\frac{\dot{a}}{a}\right)^2 = \frac{\Lambda}{3} \longrightarrow a \propto e^{H_\Lambda t}$$

t_i Inflation begins

t_f Inflation ends

$$a(t) = \begin{cases} a_i \left(\frac{t}{t_i}\right)^{1/2} & t < t_i \\ a_i e^{H_i(t-t_i)} & t_i < t < t_f \\ a_i e^{H_i(t_f-t_i)} \left(\frac{t}{t_f}\right)^{1/2} & t > t_f \end{cases}$$

$$\frac{a(t_f)}{a(t_i)} = e^N \quad N = H_i(t_f - t_i) \quad \text{number of e-foldings}$$

Example: $t_i = T_{GUT} = 10^{-36} \text{ s}$ $H_i \sim t_{GUT}^{-1} \sim 10^{36} \text{ s}^{-1}$ $N \sim 100$
Even if inflation lasts for $\Delta t \sim 10^{-34} \text{ s}$

$$\frac{a(t_f)}{a(t_i)} \simeq 10^{43}$$

NOT BAD!

Any weirdness like monopole

Would be diluted away!

Inflation solves the Flatness problem

Something like a Λ

$$H = \text{const}; \quad a \sim \exp(H_I t)$$

$$1 - \Omega(t) = \frac{c^2}{R_0^2 a^2 H^2}$$

$$|1 - \Omega(t_f)| = \exp(-2N) |1 - \Omega(t_i)|$$

For $N \sim 100$ NOT BAD!

Inflation Solves the Flatness Problem

What made the Universe so flat?

What made the Universe so big?

What made the universe so uniform?

What seeded the galaxies?

Why is the Universe so uniform?

Inflation solves that

Inflation solves the Horizon problem

In an accelerated expansion the particle horizon and the Hubble horizon can be VERY DIFFERENT

Given the same dt , dp can be very different if $a(t)$ is weird!

As an added bonus:

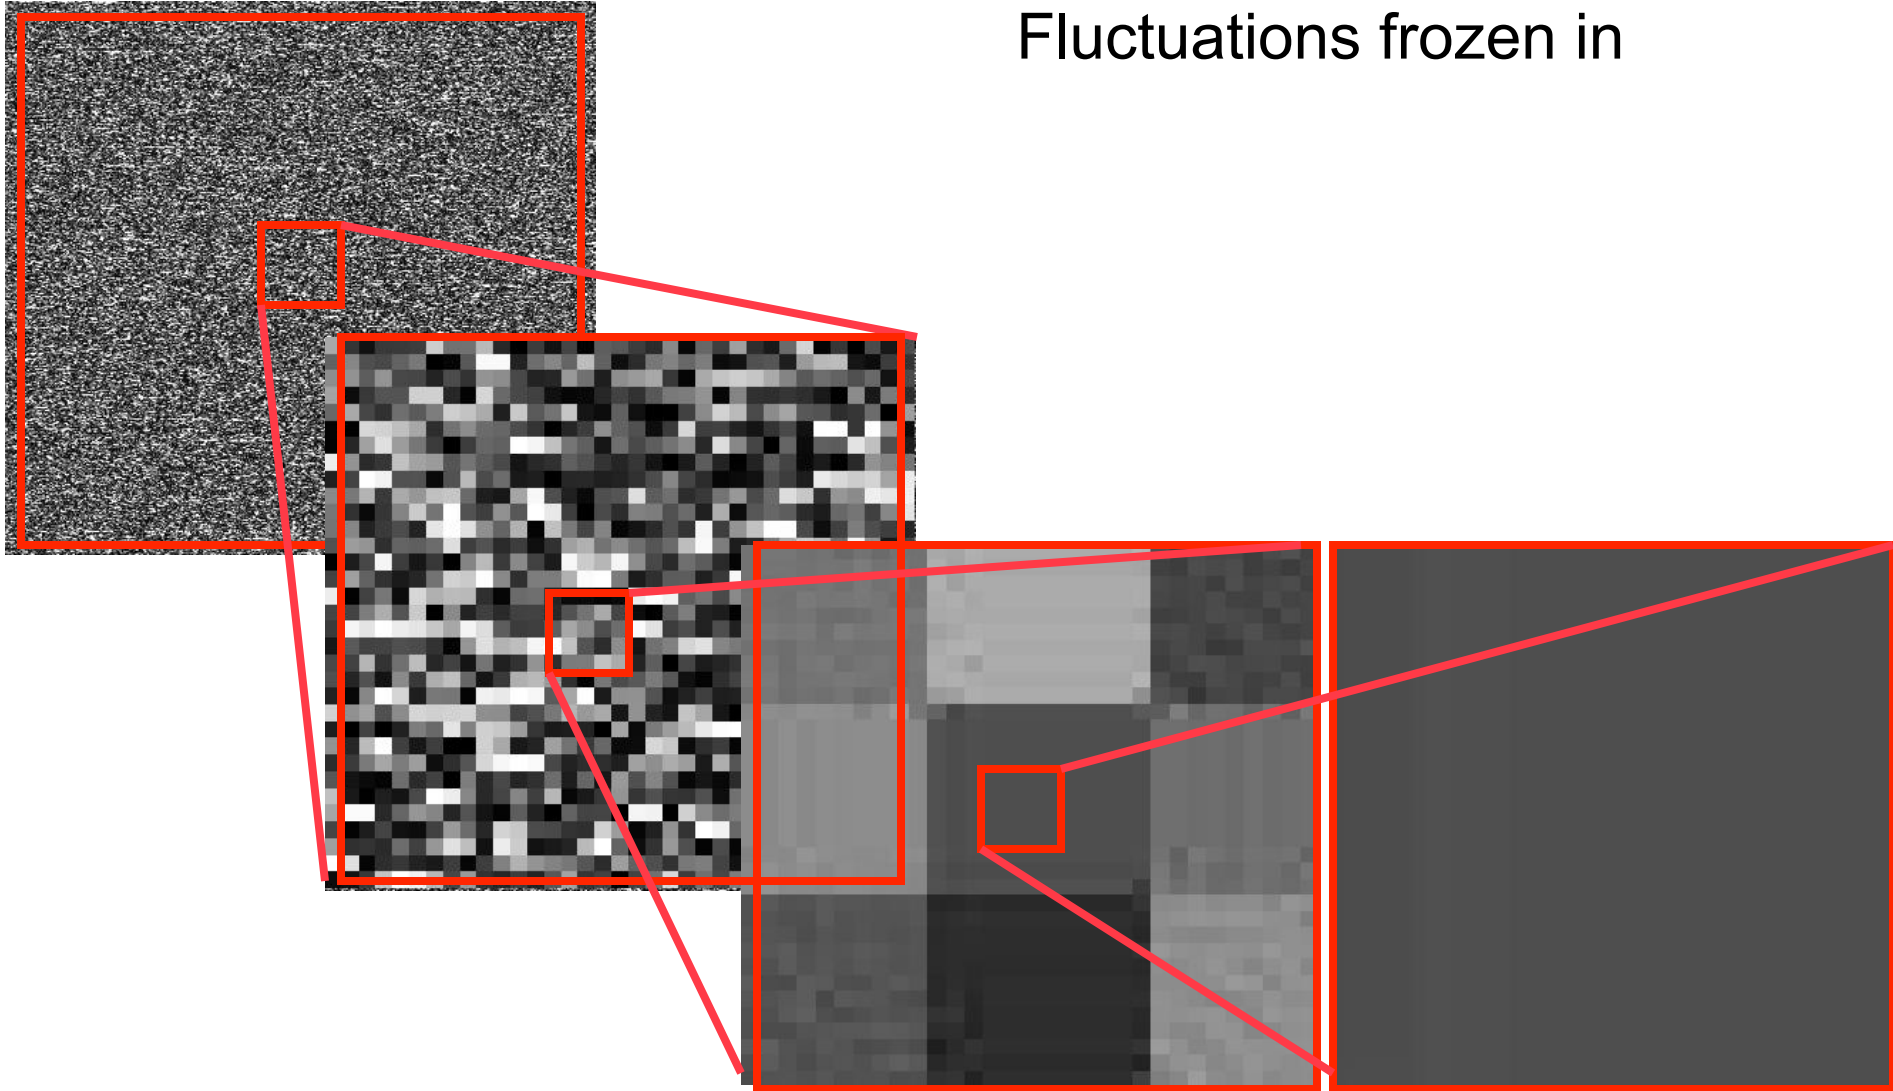

Inflation generates Gaussian perturbations: quantum fluctuations stretched to become classical by the expansion. The mechanism is similar to Hawking's radiation. (The event horizon being the complementary concept to the particle horizon...)

Turns out that the power spectrum of these perturbations will be a power law: different models of inflation predict slightly different power laws, but all close to "scale invariant" ..

Perturbations outside the Horizon?

Inflation solves that

Fluctuations frozen in

CAN THIS BE TESTED?

flatness

Power law primordial power spectrum

Can even hope to distinguish specific models

Super horizon fluctuations (polarization)

gaussianity

Can even hope to distinguish specific models

Stochastic background of gravity waves
(polarization)

We (and all of chemistry) are a small minority in the Universe.

In brief

Last Judgment, Vasari, Florence Duomo

Einstein's Greatest Blunder

1909: Einstein's general theory of relativity
predicts the expansion of the universe!

$$G_{\mu\nu} = 8\pi T_{\mu\nu}$$

Dis iss clearly
wrong!

Einstein's Greatest Blunder

1909: Einstein's general theory of relativity
predicts the expansion of the universe!

$$G_{\mu\nu} = 8\pi T_{\mu\nu} + \Lambda\delta_{\mu\nu}$$

Better!

Einstein introduced a fudge factor to make the universe static: the *cosmological constant*,
 Λ = the energy of empty space.

Vacuum energy

(also known as dark energy or cosmological constant)

vacuum

1917

$$E_1 = \rho_v V_1$$

Vacuum energy

(also known as dark energy or cosmological constant)

vacuum

1917

Negative pressure!

Does not dilute!

$$E_1 = \rho_v V_1$$

$$E_2 = \rho_v V_2$$

$$E_2 > E_1$$

Einstein's Greatest Blunder

1929: Hubble discovers the cosmological expansion.

D'oh!

It's the amount of "stuff" in the Universe that determine its geometry

**The galaxy distribution
and gravitational lensing
and galaxy rotation curves (see Vera Rubin's approach)
and galaxy clusters (remember Zwicky)
tell us...**

that there is not enough matter to make the Universe flat

$$\Omega_m \ll 1$$

What?

The nagging problem of
the age of the universe...

Just give me a standard candle....

Since 1998

accreting White Dwarf

(artist impression)

Credit: ESA and Justyn R. Maund (Cambridge)

Hubble tried this
with galaxies...

Do you have a sharp eye for Supernova explosions?

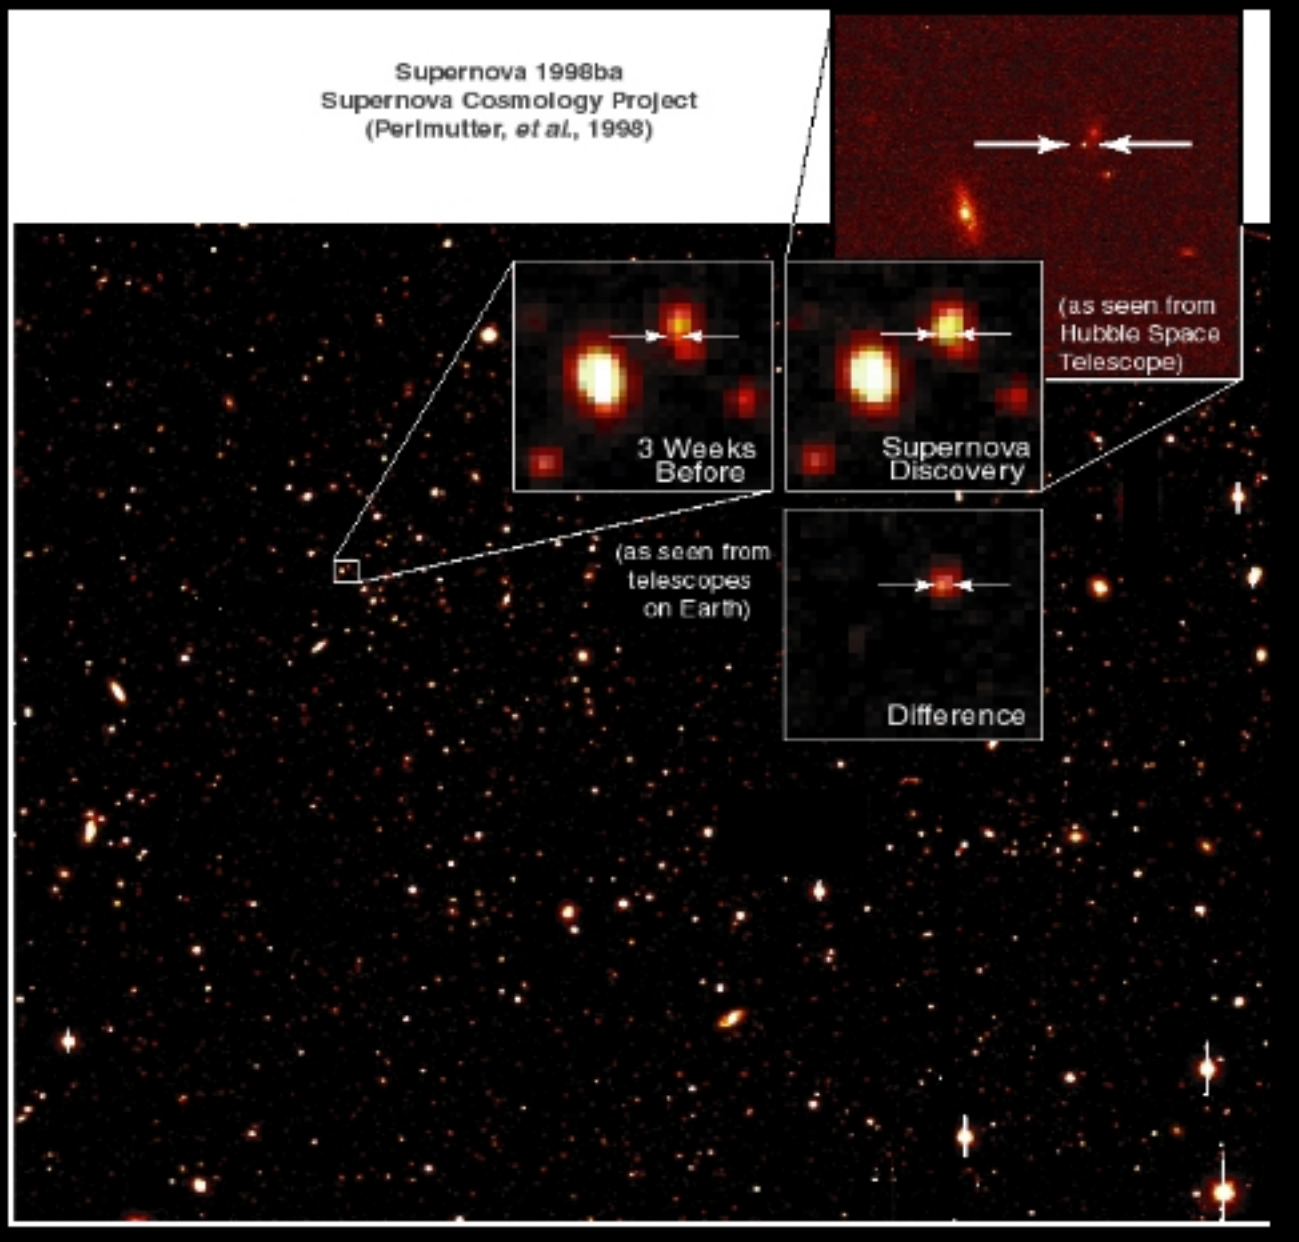

A particular type of Supernovae are STANDARD CANDLES

- The program:
 - Search for SN1a in distant galaxies
 - Compare expected power with observed power to determine distance
 - Measure velocity using redshift
- “Low redshift” galaxies give measurement of H_0
- “High redshift” galaxies allows you to look for deceleration of universe

Standard candles

Strategy:
stare at one
patch of
the sky for a
long time,
waiting for
a star to
blow up.

In practice: Magnitudes

Apparent magnitude $m \equiv -2.5 \log_{10}(f/f_x)$

Note the - sign: larger number=fainter

$$f_x = 2.53 \times 10^{-8} W/m^2$$

Absolute magnitude $M = -2.5 \log_{10}(L/L_x)$

$$L_x = 78.7 L_{\odot} \text{ As if } x \text{ was at } 10\text{pc}$$

$$M = m - 5 \log_{10} \left(\frac{d_L}{1 \text{Mpc}} \right) - 25$$

$$\mu = M - m$$

- This program gives most accurate value for Hubble's constant
 - $H=74.2$ km/s/Mpc, error $<4\%$
- Find acceleration, not deceleration!
 - Very subtle, but really is there in the data!
 - Profound result!

1998!

Humm the expansion seems to accelerate...

What the heck!

Nobel prize in Physics 2011

Saul Perlmutter, Brian P. Schmidt and Adam G. Riess
*"for the discovery of the accelerating expansion of the
Universe through observations of distant supernovae".*

Einstein's Greatest Blunder

1998: Accelerating expansion

Λ

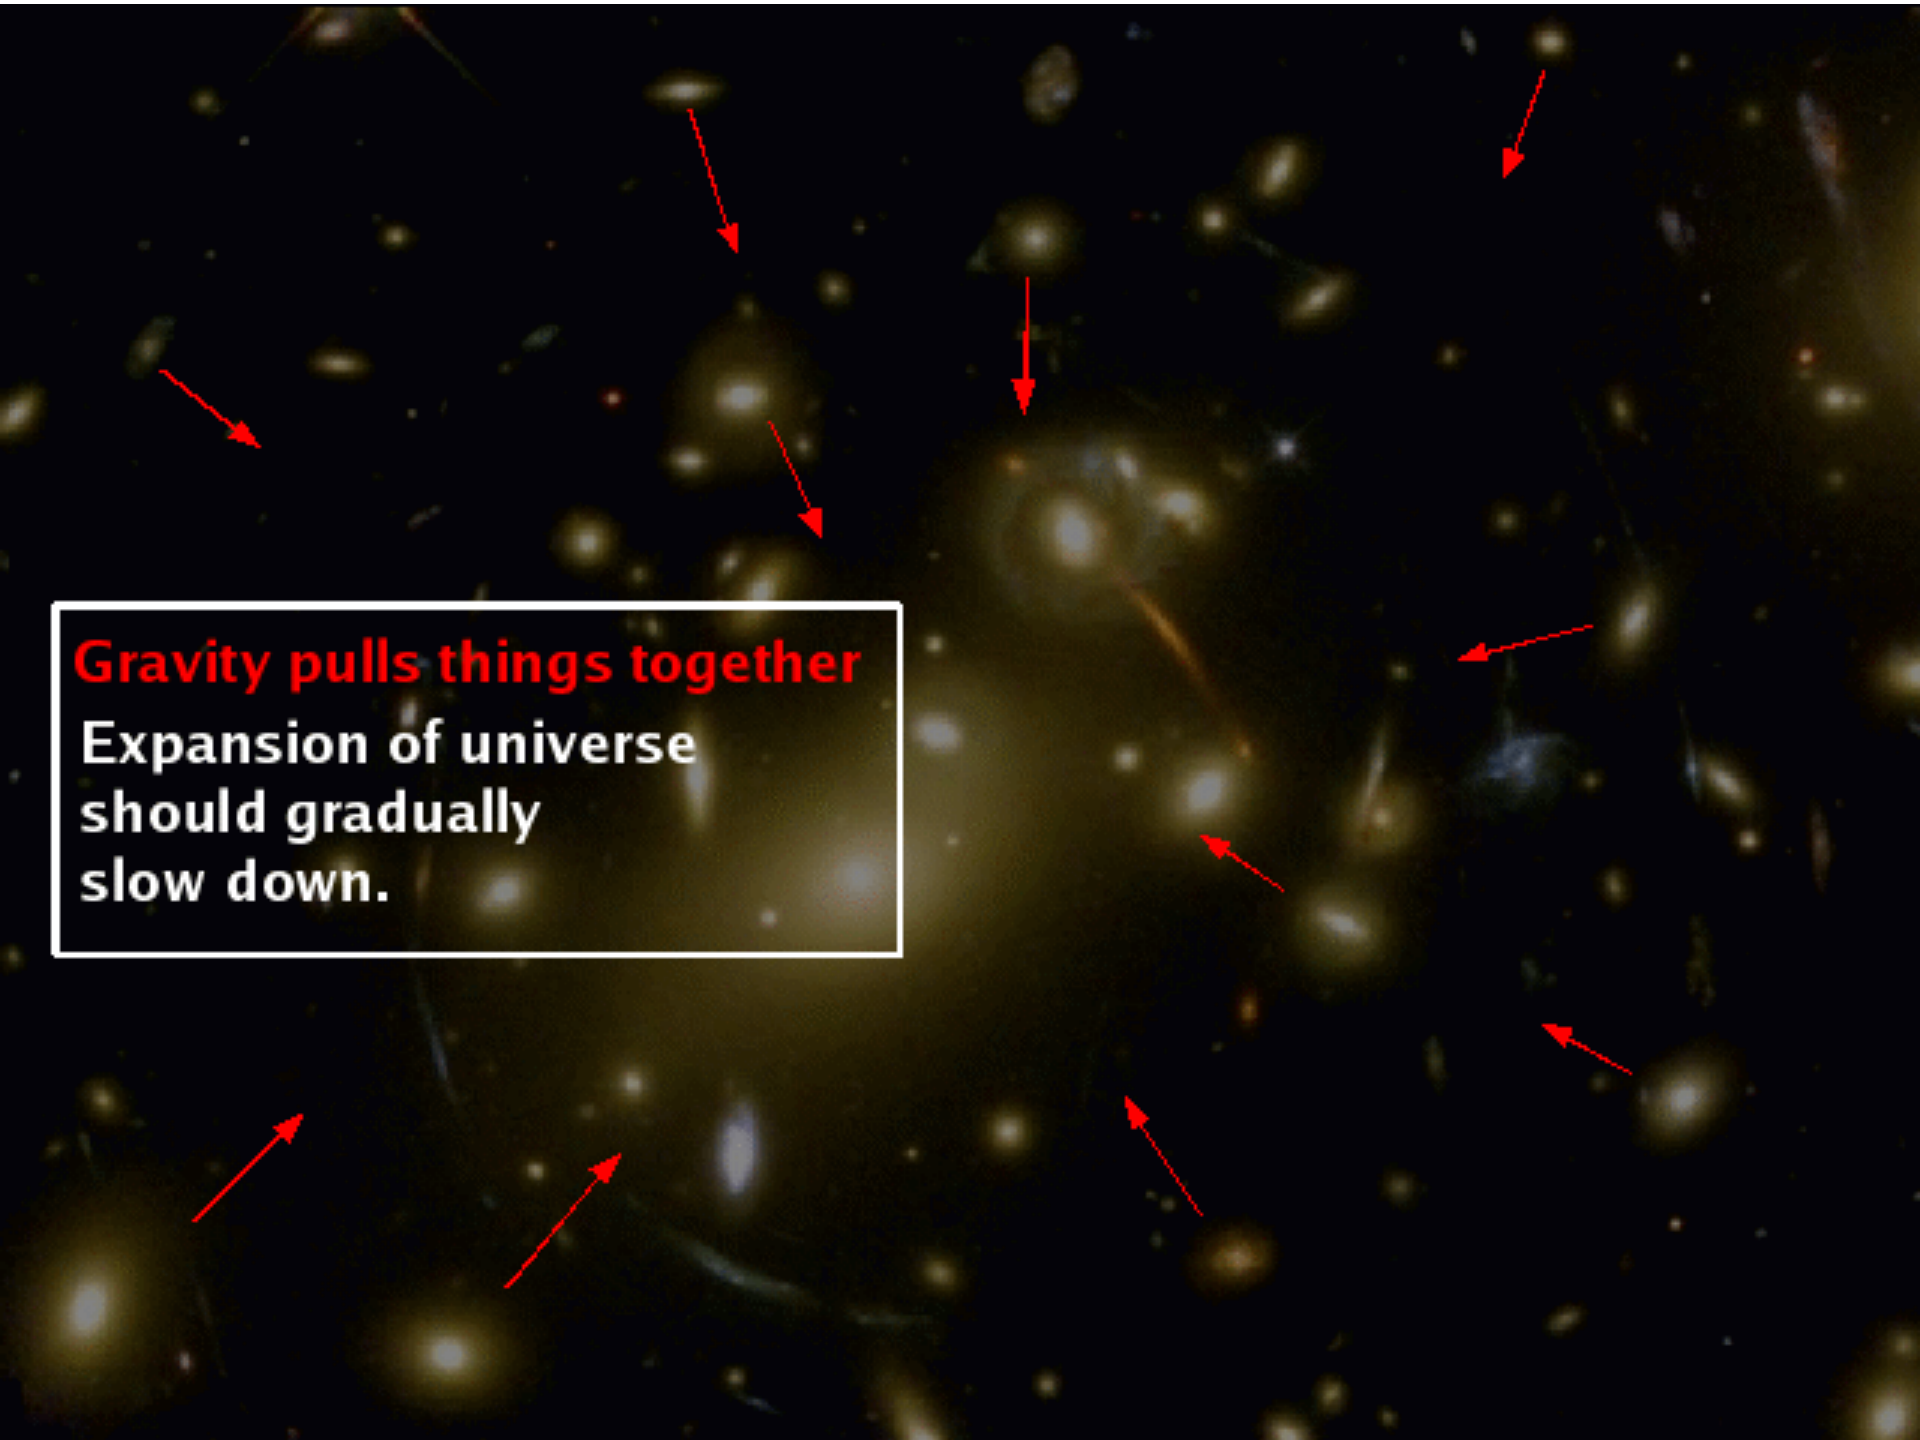

D'oh!

D'oh!

The image shows a vast field of galaxies, primarily yellow and orange in color, set against a dark background. Numerous red arrows are scattered across the field, all pointing towards a central area. This visualizes the concept of gravity pulling objects together, counteracting the expansion of the universe. A white-bordered box in the lower-left quadrant contains text explaining this phenomenon.

Gravity pulls things together
Expansion of universe
should gradually
slow down.

Something is pushing the galaxies apart

DARK ENERGY

The image shows a vast field of galaxies, some appearing as bright yellowish-white points and others as more complex, blueish structures. Numerous yellow arrows originate from the center and point outwards in various directions, representing the expansion of the universe. The text 'DARK ENERGY' is prominently displayed in the center in a bold, yellow font.

What is the dark energy?

Nothing.

One puzzle: all matter dilutes away,
but dark energy remains constant.
So why are they (very roughly)
comparable today?

The past was dominated by matter,
the future will be dominated by dark energy.
What makes the present day so special?

The latest results!

Planck collaboration paper XVI

This is a preposterous universe.

- Why is the vacuum energy density so much smaller than it should be? Naive expectation:

$$\rho_{\text{DE}}^{(\text{theory})} = 10^{120} \rho_{\text{DE}}^{(\text{obs})}$$

- What is the nonzero dark energy? A tiny vacuum energy, a dynamical field, or something even more dramatic?
- Why now? Remember $\rho_{\text{DE}} / \rho_{\text{M}} \sim a^3$. So why are they approximately equal today?

And it's moving quickly:

$$\frac{\Omega_{\Lambda}}{\Omega_M} \sim a^3$$

The standard cosmological model

96% of the Universe is missing!!!

Major questions :

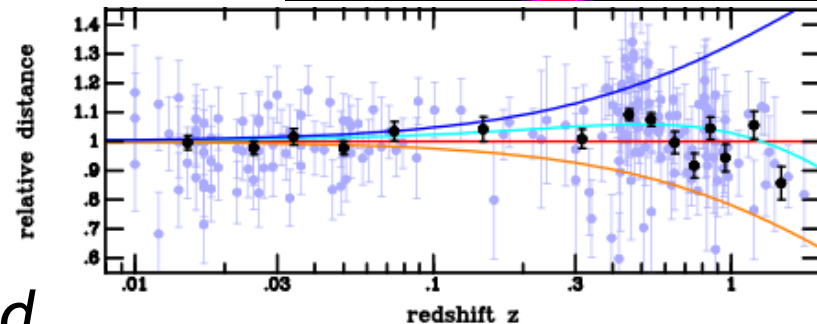

Questions that can be addressed exclusively by looking up at the sky

1) What created the primordial perturbations?

2) What makes the Universe accelerate?

These questions may not be unrelated

Dark Energy: have you seen it?

Smoothly distributed: does not fall into galaxies and clusters

Affects the Universe only at its largest scales

Almost constant density: does not really dilute as the Universe expand

Invisible:

only visible through its effects on the expansion and geometry of the Universe

Possibly associated with vacuum (I.e. nothing)

What is it? Honestly... ...*We haven't got a clue*

So.. Where do we go from here?

We have an inventory of what makes up the Universe but no understanding.

Connections with fundamental physics!

What may be going on?

Options include:

The vacuum energy is very different in other far far away parts of the Universe

We just got lucky...

A slowly varying dynamical component taking over (and it may not even be the first time)

Einstein was wrong

String theory?

Dark energy: is it a cosmological constant?

Is $w=-1$? If not we expect it to vary in time....

Coupling in the dark sector?

Variation of fundamental constants?

Was Einstein wrong? Something on large scales?

Dark energy shows its effects on scales comparable to the horizon... 10^{26} m

Precision test of the law of gravity have been carried out on scales $< 10^{13}$ m

An enormous extrapolation is required

The blessing and the curse of cosmology

We only have one observable Universe

We can make “ultimate experiments”

(CM)Bpol/PRISM (proposal stage)

Different inflationary models leave their signature in the CMB. In particular in the polarization patterns of the CMB light.

The ultimate primary CMB polarization experiment

Euclid

Chasing dark energy: expansion history and growth of structures

An analogy: the theory of gravitation at the time of N. Copernicus (1473-1543)

“ I believe that gravity is nothing but a certain natural desire, which the divine providence of the Creator of all things has implanted in parts, to gather as a unity and a whole by combining in the form of a globe. This impulse is present, we may suppose, also in the sun, in the moon, and in the other brilliant planets, so that through its operation they remain in that spherical shape which they display. Nevertheless, they swing round their circles in diverse ways...”

De Revolutionibus Orbitum Coelestium

The theory of gravitation after Isaac Newton (1643-1727)

- All objects in the universe attract each other with the force $F = G m_1 m_2 / d^2$
- That's now quantitative... it can predict the orbital period of the Moon, Kepler's laws of planet motion, planet perturbations from Kepler's laws, precession of the Moon's orbit, ocean tides, deviation of Earth's shape from a perfect sphere...

A (personal) perspective on the future of cosmology

- Our ideas on cosmology are somewhat like Copernicus' ideas on gravity.
- We need a new Isaac Newton (or Einstein) who will explain why not just how gravity works...

How long will that take?

It took ~ 150 years from Copernicus to Newton and another ~230 years from Newton to Einstein.

Will it be longer or shorter than that?

Maybe one of YOU....

Something really funny

COSMOLOGY MARCHES ON

“Nothing” really funny

COSMOLOGY MARCHES ON
