

Diffractive and Exclusive Landscape

Approximate and for 8 TeV : want updated and for 13 TeV but ...
Useful for orientation.

Per 100 hours of running (~ 1 week or less) with
25ns/X (40 MHz) and $\langle \text{PU} \rangle = \mu = 1$ so $\text{Prob}(1) = 37\%$
with $\sigma(\text{inel}) = 70 \text{ mb}$
get $L(\text{eff},1) = 80 \text{ pb}^{-1}$

E.g. take **exclusive $p + \gamma\gamma + p$** with $E_T(\gamma) > 5 \text{ GeV} \rightarrow \sim 200$ events in 2 weeks
Unique test of (NP + P) QCD and closely related to exclusive $p + \text{Higgs} + p$

CMS search: no candidates.

CDF observation (42 candidates) but $E_T(\gamma) > 2.5 \text{ GeV}$, $\sqrt{s} = 1.96 \text{ TeV}$.

>> Probably can be done with a few additional collisions, not with many

~ 1200 **exclusive (photoproduced) $\Upsilon(1S) \rightarrow e+e-$ or $\mu+\mu-$** with no pile-up
(This is more forgiving of PU)

The Gap and Exclusive Landscape

$\sqrt{s} = 8 \text{ TeV}$: approximate only
