Contribution ID: 92

Type: Oral presentation (15min)

Overview on AL.AT cryogenic solutions under 4.5K

Wednesday 9 July 2014 17:00 (15 minutes)

Through its history from 70's, Air Liquide Advanced Technologies developed various cryogenic solutions (cold machines and cryogenic refrigeration) to support superconductivity applications. Thanks to a proven reliability pointed out in particular by the huge refrigeration architecture at LHC, CERN, very cold cryogenics has become "usual". Reach very cold temperature more favorable to superconductivity (~2K) is then becoming widespread. Consequently, in recent years, all over the world, many experiences and projects of various size requiring very low temperatures were carried out.

The aim of this paper is to present an overview of Air Liquide past and recent contributions to Very Low temperature Superconductivity, focusing on the current project for the Turkish accelerator (TARLA).

Author: CRISPEL, Simon (Air Liquide Advanced Technologies)

Co-authors: GONDRAND, Cecile (Air Liquide Advanced Technologies); Mrs DESCHILDRE, Cindy (Air Liquide); Mr DELCAYRE, Franck (Air Liquide); Mr BERNHARDT, Jean-Marc (AIRL LIQUIDE)

Presenter: CRISPEL, Simon (Air Liquide Advanced Technologies)

Session Classification: Wed-Af-Orals Session 10

Track Classification: C-01: Large scale refrigeration, liquefaction
