Preliminary Study on Air in Liquid Hydrogen

Wednesday, 9 July 2014 14:15 (1h 45m)

The accumulated oxygen in liquid hydrogen is a big risk for storage. The oxygen and nitrogen molecules will be cooled down from gas to solid when air enters the liquid hydrogen. The intermolecular attractive force can influence the accumulation of oxygen and nitrogen molecules. The contents of molecule clusters can be different from each other. This paper studies the accumulation of air in liquid hydrogen by experiment and shows some initial results.

Primary author: Dr LEI, Gang (State Key Laboratory in Technologies of Space Cryogenic Propellants)

Co-authors: Mr LI, Aihua (State Key Laboratory in Technologies of Space Cryogenic Propellants); Mr LIU, Haisheng (Beijing Institute of Aerospace Testing Technology); Dr WANG, Tianxiang (State Key Laboratory in Technologies of Space Cryogenic Propellants); Dr LIANG, Wenqing (Southeast University)

Presenters: Mr LI, Aihua (State Key Laboratory in Technologies of Space Cryogenic Propellants); Dr LEI, Gang (State Key Laboratory in Technologies of Space Cryogenic Propellants); Mr LIU, Haisheng (Beijing Institute of Aerospace Testing Technology); Dr WANG, Tianxiang (State Key Laboratory in Technologies of Space Cryogenic Propellants); Dr LIANG, Wenqing (Southeast University)

Session Classification: Wed-Af-Posters Session 2.5

Track Classification: C-17: Safety, reliability and standards
