

Higgs Results from CMS

Monday, 9 September 2013 14:30 (30 minutes)

On July 4, 2012, the CMS experiment at the LHC, along with ATLAS, announced the observation of a new particle which is like the Higgs boson as predicted within the Standard Model of High Energy Physics. Since that time, more data have been accumulated and the signal is more firmly established. Some of the properties of production and decay of this new state have been studied. We plan to present the recent result from the CMS experiment.
