

Exclusive dilepton photoproduction in pp and p-Pb collisions with CMS :

We'll present studies of exclusive photoproduction of dileptons in proton-proton at $\sqrt{s}=7$ TeV and p-Pb at $\sqrt{s}=5.02$ TeV with the CMS detector. The events selected with back-to-back muon pairs and no significant additional activity in the detector. The physics process corresponds to these events are two photon exchange and exclusive photo-production of Upsilon (1S,2S,3S) mesons. We'll present the latest experimental measurements and comparisons to theoretical expectations.
