Using control system tools for operation and debugging

Wednesday, 30 October 2013 14:00 (30 minutes)

When investigating a problem, one typically needs to gather and correlate information from disparate sources: operating system, batch system, data transfer tools, and so on. We investigate the use of Control System Studio to gather information from multiple places. When the appropriate hooks are created, this should allow the end user to create ad-hoc ways to mix and match data without the need of writing programs or web pages.
