

Numerical Computing Workshop - Introduction

Andrzej Nowak, CERN openlab

May 27th 2013

with material from Sverre Jarpe and the speakers

**CERN openlab / Intel Numerical Computing
Workshop Spring 2013**

PARTNERS

ORACLE

SIEMENS

CONTRIBUTOR

- > **CERN openlab is a unique research partnership of CERN and the industry**
- > **Objective: The advancement of cutting-edge computing solutions to be used by the worldwide LHC community**
 - Partners support manpower and equipment in dedicated competence centers
 - openlab delivers published research and evaluations based on partners' solutions – in a very challenging setting
- > **Created robust hands-on training program in various computing topics, including international computing schools; Summer Student program**
- > **<http://cern.ch/openlab>**

Why have this workshop?

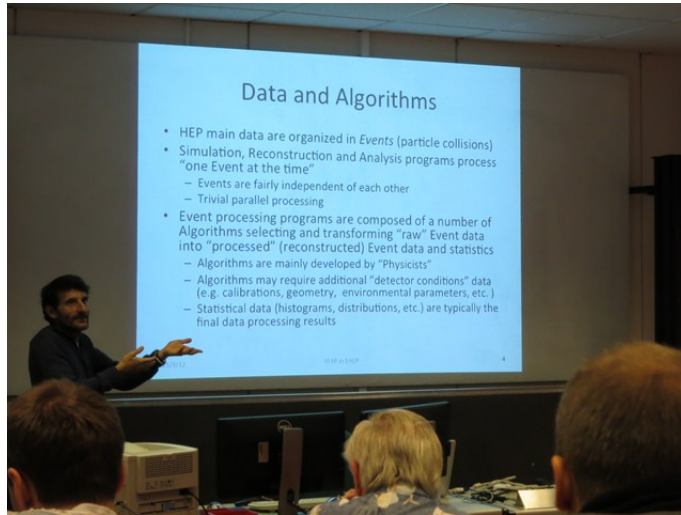

> In a constantly changing world:

- Hardware/software
- Vectorization/Parallelization
- New instructions (example: FMA)
- New micro-architectures
 - Example: Throughput of VSQRTPD
- Also: evolving standards

> Highly qualified speakers on the following topics:

- IEEE754 floating-point format
- Compilers
- Math libraries
- Developments in research

Previous instances of this class

> Practice

- Floating point in experimental data processing and in data analysis

> Understanding floating point

- Properties and algorithms
- Control in compilers and libraries

> Hands-on

- Lectures interleaved with exercises

> State of the art

- Target accuracy in HEP software
- Living with heterogeneity and non-CPU systems

- > **How is floating point used and abused in HEP data processing and in data analysis?**
- > **Challenges, opportunities, limitations**
- > **Technical challenges:**
 - Libraries, compilers
 - Old algorithms for x87
 - Bugs
 - Vectorization

> IEEE754

- X86-64: Binary representation
 - Binary32, binary64
- Not all real numbers can be correctly represented
- The issues: Rounding and Reproducibility
 - Rounding modes and error control
- Cannot always trust what you know from your high-school math

> Jeff Arnold will talk extensively about this topic

- Which will also be supplemented by a set of exercises

> **Compilers have a great influence on floating-point calculations**

- Long list of compiler options which influence the calculations
 - Both “safe” and “unsafe”
- Unfortunately, there is no standard for defining options

> **Martyn Corden will cover the Intel compiler and libraries and also compare to GNU**

- Including a set of exercises

- > **Equally vital for FLP calculations (at least at CERN), but the issues remain:**
 - Accuracy versus speed
 - Argument ranges
 - Rounding options
 - Precision: Average and maximum error
- > **Bit-accurate libraries exist, but often a limited number of digits are sufficient.**
- > **Danilo Piparo will cover HEP efforts**
- > **Florent de Dinechin will cover this topic in great detail**

Heterogeneity and non-CPU techniques

> Getting good floating point consistency on GPUs

- David Rohr

> Numerical processing in FPGAs

- Florent de Dinechin

```

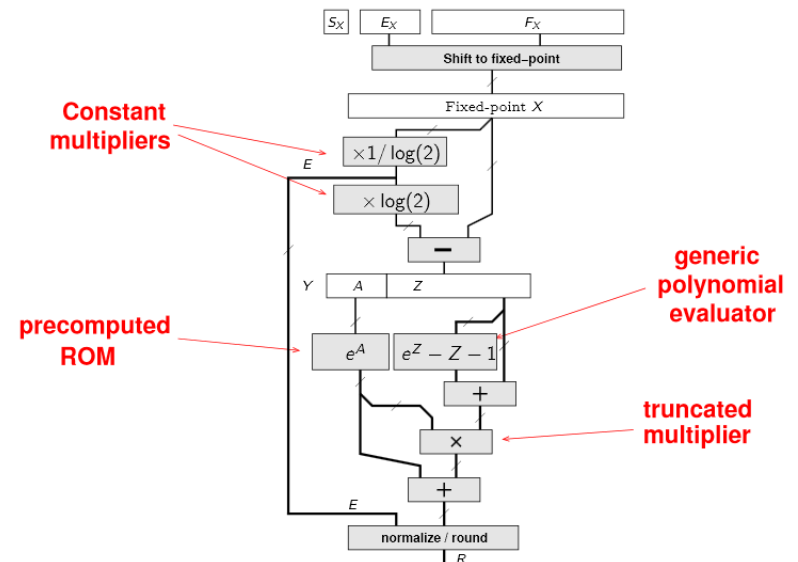

cpu_wrapper.cpp:
#define __DECL void
#include ``common.cpp``

void FitTracks() {
  for (int i = 0; i < nTr; i++) {
    FitTrack(n);
  }
}

gpu_wrapper.cpp:
#define __DECL __device void
#include ``common.cpp``

__kernel void FitTracksGPU() {
  FitTrack(threadIdx.x);
}

void FitTracks() {
  FitTracksGPU<<<nTr>>>();
}
  
```

- > **This workshop will help in full understanding and control of floating point**
- > **Issues**
- > **Algorithms**
- > **Compilers**
- > **Libraries**
- > **Heterogeneity**
- > **“Make sure you are in the driver’s seat”**
