

How relevant is the
ISO 9660 Standard in
today's world for
JACoW ?

Volker RW Schaa

GSI Darmstadt, Germany

JACoW Team Meeting,
16Nov05

What is ISO 9660?

- A standard CD-ROM filesystem developed in 1985

What is ISO 9660?

- A standard CD-ROM filesystem developed in 1985
- Agreed to by manufactures at the High Sierra Hotel & Casino in Lake Tahoe, CA (👉 *High Sierra*)

What is ISO 9660?

- A standard CD-ROM filesystem developed in 1985
- Agreed to by manufactures at the High Sierra Hotel & Casino in Lake Tahoe, CA (☞ *High Sierra*)
- A file and directory naming standard to be readable on any platform, regardless of the content format.

What is ISO 9660?

- A standard CD-ROM filesystem developed in 1985
- Agreed to by manufactures at the High Sierra Hotel & Casino in Lake Tahoe, CA (☞ *High Sierra*)
- A file and directory naming standard to be readable on any platform, regardless of the content format.
- Full cross platform compatibility for DOS, Windows, Macintosh, UNIX, etc.

What is ISO 9660?

- A standard CD-ROM filesystem developed in 1985
- Agreed to by manufactures at the High Sierra Hotel & Casino in Lake Tahoe, CA (☛ *High Sierra*)
- A file and directory naming standard to be readable on any platform, regardless of the content format.
- Full cross platform compatibility for DOS, Windows, Macintosh, UNIX, etc.
- A name, extension, directory or volume may consists of zero or more characters of the set [A-Z], [0-9] and _

What is ISO 9660?

- A standard CD-ROM filesystem developed in 1985
- Agreed to by manufactures at the High Sierra Hotel & Casino in Lake Tahoe, CA (☞ *High Sierra*)
- A file and directory naming standard to be readable on any platform, regardless of the content format.
- Full cross platform compatibility for DOS, Windows, Macintosh, UNIX, etc.
- A name, extension, directory or volume may consists of zero or more characters of the set [A-Z], [0-9] and _
- Three levels of (pure) ISO-9660 have been defined

What is ISO 9660?

- A standard CD-ROM filesystem developed in 1985
- Agreed to by manufactures at the High Sierra Hotel & Casino in Lake Tahoe, CA (☛ *High Sierra*)
- A file and directory naming standard to be readable on any platform, regardless of the content format.
- Full cross platform compatibility for DOS, Windows, Macintosh, UNIX, etc.
- A name, extension, directory or volume may consists of zero or more characters of the set [A-Z], [0-9] and _
- Three levels of (pure) ISO-9660 have been defined

Levels of ISO 9660

- Level 1:

Levels of ISO 9660

- Level 1:
 - 8+3 convention (familiar from MS-DOS)

Levels of ISO 9660

- Level 1:
 - 8+3 convention (familiar from MS-DOS)
 - 8 characters for filename, a period, and 3 characters for file type

Levels of ISO 9660

- Level 1:
 - 8+3 convention (familiar from MS-DOS)
 - 8 characters for filename, a period, and 3 characters for file type
 - all in uppercase, allowed characters are A-Z, 0-9, » . «, and »_«.

Levels of ISO 9660

- Level 1:
 - 8+3 convention (familiar from MS-DOS)
 - 8 characters for filename, a period, and 3 characters for file type
 - all in uppercase, allowed characters are A-Z, 0-9, » . «, and »_«.
 - maximum directory depth is 8

Levels of ISO 9660

- Level 1:
 - 8+3 convention (familiar from MS-DOS)
 - 8 characters for filename, a period, and 3 characters for file type
 - all in uppercase, allowed characters are A-Z, 0-9, », .«, and »_«.
 - maximum directory depth is 8
- Level 2:

Levels of ISO 9660

- Level 1:
 - 8+3 convention (familiar from MS-DOS)
 - 8 characters for filename, a period, and 3 characters for file type
 - all in uppercase, allowed characters are A-Z, 0-9, », .«, and »_«.
 - maximum directory depth is 8
- Level 2:
 - allows far more flexibility in filenames,

Levels of ISO 9660

- Level 1:
 - 8+3 convention (familiar from MS-DOS)
 - 8 characters for filename, a period, and 3 characters for file type
 - all in uppercase, allowed characters are A-Z, 0-9, », . «, and »_«.
 - maximum directory depth is 8
- Level 2:
 - allows far more flexibility in filenames,
 - isn't usable on some systems, notably MS-DOS

Levels of ISO 9660

- Level 1:
 - 8+3 convention (familiar from MS-DOS)
 - 8 characters for filename, a period, and 3 characters for file type
 - all in uppercase, allowed characters are A-Z, 0-9, », .«, and »_«.
 - maximum directory depth is 8
- Level 2:
 - allows far more flexibility in filenames,
 - isn't usable on some systems, notably MS-DOS
- ☞ not used

Levels of ISO 9660

- Level 1:
 - 8+3 convention (familiar from MS-DOS)
 - 8 characters for filename, a period, and 3 characters for file type
 - all in uppercase, allowed characters are A-Z, 0-9, » . «, and »_«.
 - maximum directory depth is 8
- Level 2:
 - allows far more flexibility in filenames,
 - isn't usable on some systems, notably MS-DOS
 - not used
- Level 3:

Levels of ISO 9660

- Level 1:
 - 8+3 convention (familiar from MS-DOS)
 - 8 characters for filename, a period, and 3 characters for file type
 - all in uppercase, allowed characters are A-Z, 0-9, » . «, and »_«.
 - maximum directory depth is 8
- Level 2:
 - allows far more flexibility in filenames,
 - isn't usable on some systems, notably MS-DOS
 - ☞ not used
- Level 3:
 - total length of name and extension now 30 characters (+ » . «)

Levels of ISO 9660

- Level 1:
 - 8+3 convention (familiar from MS-DOS)
 - 8 characters for filename, a period, and 3 characters for file type
 - all in uppercase, allowed characters are A-Z, 0-9, » . «, and »_«.
 - maximum directory depth is 8
- Level 2:
 - allows far more flexibility in filenames,
 - isn't usable on some systems, notably MS-DOS
 - ☞ not used
- Level 3:
 - total length of name and extension now 30 characters (+ » . «)
 - allows non-contiguous files

Levels of ISO 9660

- Level 1:
 - 8+3 convention (familiar from MS-DOS)
 - 8 characters for filename, a period, and 3 characters for file type
 - all in uppercase, allowed characters are A-Z, 0-9, » . «, and »_«.
 - maximum directory depth is 8
- Level 2:
 - allows far more flexibility in filenames,
 - isn't usable on some systems, notably MS-DOS
 - ☞ not used
- Level 3:
 - total length of name and extension now 30 characters (+ » . «)
 - allows non-contiguous files
 - multiple packets for files

Levels of ISO 9660

- Level 1:
 - 8+3 convention (familiar from MS-DOS)
 - 8 characters for filename, a period, and 3 characters for file type
 - all in uppercase, allowed characters are A-Z, 0-9, » . «, and »_«.
 - maximum directory depth is 8
- Level 2:
 - allows far more flexibility in filenames,
 - isn't usable on some systems, notably MS-DOS
 - ☞ not used
- Level 3:
 - total length of name and extension now 30 characters (+ » . «)
 - allows non-contiguous files
 - multiple packets for files
 - useful mostly for more flexible packet-writing software

Levels of ISO 9660

- Level 1:
 - 8+3 convention (familiar from MS-DOS)
 - 8 characters for filename, a period, and 3 characters for file type
 - all in uppercase, allowed characters are A-Z, 0-9, », . «, and »_«.
 - maximum directory depth is 8
- Level 2:
 - allows far more flexibility in filenames,
 - isn't usable on some systems, notably MS-DOS
 - ☞ not used
- Level 3:
 - total length of name and extension now 30 characters (+ » . «)
 - allows non-contiguous files
 - multiple packets for files
 - useful mostly for more flexible packet-writing software
- These levels were not as important as various extensions to ISO 9660 (Rock Ridge, Joliet, Romeo) which supersede level 1–3

Levels of ISO 9660

- Level 1:
 - 8+3 convention (familiar from MS-DOS)
 - 8 characters for filename, a period, and 3 characters for file type
 - all in uppercase, allowed characters are A-Z, 0-9, », . «, and »_«.
 - maximum directory depth is 8
- Level 2:
 - allows far more flexibility in filenames,
 - isn't usable on some systems, notably MS-DOS
 - ☞ not used
- Level 3:
 - total length of name and extension now 30 characters (+ » . «)
 - allows non-contiguous files
 - multiple packets for files
 - useful mostly for more flexible packet-writing software
- These levels were not as important as various extensions to ISO 9660 (Rock Ridge, Joliet, Romeo) which supersede level 1–3

Extensions of ISO 9660

- Rock Ridge:

Extensions of ISO 9660

- Rock Ridge:
 - file system with long filenames up to 256 characters

Extensions of ISO 9660

- Rock Ridge:
 - file system with long filenames up to 256 characters
 - allowed characters are A-Z, a-z, 0-9, » . _ «, no » * / \ ; : \$ «

Extensions of ISO 9660

- Rock Ridge:
 - file system with long filenames up to 256 characters
 - allowed characters are A-Z, a-z, 0-9, » . _ «, no » * / \ ; : \$ «
 - POSIX file system semantics

Extensions of ISO 9660

- Rock Ridge:
 - file system with long filenames up to 256 characters
 - allowed characters are A-Z, a-z, 0-9, » . _ «, no » * / \ ; : \$ «
 - POSIX file system semantics
 - Rock Ridge encoded disks appear as standard ISO9660 on non-UNIX platforms (truncated filenames)

Extensions of ISO 9660

- Rock Ridge:
 - file system with long filenames up to 256 characters
 - allowed characters are A-Z, a-z, 0-9, » . _ «, no » * / \ ; : \$ «
 - POSIX file system semantics
 - Rock Ridge encoded disks appear as standard ISO9660 on non-UNIX platforms (truncated filenames)
- Joliet:

Extensions of ISO 9660

- Rock Ridge:
 - file system with long filenames up to 256 characters
 - allowed characters are A-Z, a-z, 0-9, » . _ «, no » * / \ ; : \$ «
 - POSIX file system semantics
 - Rock Ridge encoded disks appear as standard ISO9660 on non-UNIX platforms (truncated filenames)
- Joliet:
 - file system Windows 95/98/ME/NT/2000/XP compliant filenames

Extensions of ISO 9660

- Rock Ridge:
 - file system with long filenames up to 256 characters
 - allowed characters are A-Z, a-z, 0-9, » . _ «, no » * / \ ; : \$ «
 - POSIX file system semantics
 - Rock Ridge encoded disks appear as standard ISO9660 on non-UNIX platforms (truncated filenames)
- Joliet:
 - file system Windows 95/98/ME/NT/2000/XP compliant filenames
 - filenames with up to 255 characters

Extensions of ISO 9660

- Rock Ridge:
 - file system with long filenames up to 256 characters
 - allowed characters are A-Z, a-z, 0-9, » . _ «, no » * / \ ; : \$ «
 - POSIX file system semantics
 - Rock Ridge encoded disks appear as standard ISO9660 on non-UNIX platforms (truncated filenames)
- Joliet:
 - file system Windows 95/98/ME/NT/2000/XP compliant filenames
 - filenames with up to 255 characters
 - same set as Rockridge

Extensions of ISO 9660

- Rock Ridge:
 - file system with long filenames up to 256 characters
 - allowed characters are A-Z, a-z, 0-9, » . _ «, no » * / \ ; : \$ «
 - POSIX file system semantics
 - Rock Ridge encoded disks appear as standard ISO9660 on non-UNIX platforms (truncated filenames)
- Joliet:
 - file system Windows 95/98/ME/NT/2000/XP compliant filenames
 - filenames with up to 255 characters
 - same set as Rockridge
 - Joliet encoded disks appear like Rockridge encoded ones

Extensions of ISO 9660

- Rock Ridge:
 - file system with long filenames up to 256 characters
 - allowed characters are A-Z, a-z, 0-9, » . _ «, no » * / \ ; : \$ «
 - POSIX file system semantics
 - Rock Ridge encoded disks appear as standard ISO9660 on non-UNIX platforms (truncated filenames)
- Joliet:
 - file system Windows 95/98/ME/NT/2000/XP compliant filenames
 - filenames with up to 255 characters
 - same set as Rockridge
 - Joliet encoded disks appear like Rockridge encoded ones
- Romeo:

Extensions of ISO 9660

- Rock Ridge:
 - file system with long filenames up to 256 characters
 - allowed characters are A-Z, a-z, 0-9, » . _ «, no » * / \ ; : \$ «
 - POSIX file system semantics
 - Rock Ridge encoded disks appear as standard ISO9660 on non-UNIX platforms (truncated filenames)
- Joliet:
 - file system Windows 95/98/ME/NT/2000/XP compliant filenames
 - filenames with up to 255 characters
 - same set as Rockridge
 - Joliet encoded disks appear like Rockridge encoded ones
- Romeo:
 - ISO9660 file system variant (Macintosh long filenames)

Extensions of ISO 9660

- Rock Ridge:
 - file system with long filenames up to 256 characters
 - allowed characters are A-Z, a-z, 0-9, » . _ «, no » * / \ ; : \$ «
 - POSIX file system semantics
 - Rock Ridge encoded disks appear as standard ISO9660 on non-UNIX platforms (truncated filenames)
- Joliet:
 - file system Windows 95/98/ME/NT/2000/XP compliant filenames
 - filenames with up to 255 characters
 - same set as Rockridge
 - Joliet encoded disks appear like Rockridge encoded ones
- Romeo:
 - ISO9660 file system variant (Macintosh long filenames)
 - total length of name and extension 64 characters

Extensions of ISO 9660

- Rock Ridge:
 - file system with long filenames up to 256 characters
 - allowed characters are A-Z, a-z, 0-9, » . _ «, no » * / \ ; : \$ «
 - POSIX file system semantics
 - Rock Ridge encoded disks appear as standard ISO9660 on non-UNIX platforms (truncated filenames)
- Joliet:
 - file system Windows 95/98/ME/NT/2000/XP compliant filenames
 - filenames with up to 255 characters
 - same set as Rockridge
 - Joliet encoded disks appear like Rockridge encoded ones
- Romeo:
 - ISO9660 file system variant (Macintosh long filenames)
 - total length of name and extension 64 characters
 - same character set as Rock Ridge/Joliet

Extensions of ISO 9660

- Rock Ridge:
 - file system with long filenames up to 256 characters
 - allowed characters are A-Z, a-z, 0-9, » . _ «, no » * / \ ; : \$ «
 - POSIX file system semantics
 - Rock Ridge encoded disks appear as standard ISO9660 on non-UNIX platforms (truncated filenames)
- Joliet:
 - file system Windows 95/98/ME/NT/2000/XP compliant filenames
 - filenames with up to 255 characters
 - same set as Rockridge
 - Joliet encoded disks appear like Rockridge encoded ones
- Romeo:
 - ISO9660 file system variant (Macintosh long filenames)
 - total length of name and extension 64 characters
 - same character set as Rock Ridge/Joliet
 - Romeo encoded disks may not work on non-Macintosh/
non-Windows95 platforms/UNIX

Extensions of ISO 9660

- Rock Ridge:
 - file system with long filenames up to 256 characters
 - allowed characters are A-Z, a-z, 0-9, » . _ «, no » * / \ ; : \$ «
 - POSIX file system semantics
 - Rock Ridge encoded disks appear as standard ISO9660 on non-UNIX platforms (truncated filenames)
- Joliet:
 - file system Windows 95/98/ME/NT/2000/XP compliant filenames
 - filenames with up to 255 characters
 - same set as Rockridge
 - Joliet encoded disks appear like Rockridge encoded ones
- Romeo:
 - ISO9660 file system variant (Macintosh long filenames)
 - total length of name and extension 64 characters
 - same character set as Rock Ridge/Joliet
 - Romeo encoded disks may not work on non-Macintosh/
non-Windows95 platforms/UNIX

Usage of ISO 9660

What do *classical* data mastering applications use?

Software like »Easy CD Creator«, »Nero«, »WinOnCD«, ...
put on CD:

- ISO 9660

Usage of ISO 9660

What do *classical* data mastering applications use?

Software like »Easy CD Creator«, »Nero«, »WinOnCD«, ...
put on CD:

- ISO 9660

Almost always

Usage of ISO 9660

What do *classical* data mastering applications use?

Software like »Easy CD Creator«, »Nero«, »WinOnCD«, ...
put on CD:

- ISO 9660

Almost always

- ☞ which is a good idea for max. compatibility with other systems

Usage of ISO 9660

What do *classical* data mastering applications use?

Software like »Easy CD Creator«, »Nero«, »WinOnCD«, ...
put on CD:

- ISO 9660

Almost always

☞ which is a good idea for max. compatibility with other systems

- Joliet

Usage of ISO 9660

What do *classical* data mastering applications use?

Software like »Easy CD Creator«, »Nero«, »WinOnCD«, ...
put on CD:

- ISO 9660

Almost always

☞ which is a good idea for max. compatibility with other systems

- Joliet

Almost always

Usage of ISO 9660

What do *classical* data mastering applications use?

Software like »Easy CD Creator«, »Nero«, »WinOnCD«, ...
put on CD:

- ISO 9660

Almost always

- ☞ which is a good idea for max. compatibility with other systems

- Joliet

Almost always

- ☞ long file names help readability and recognition

Usage of ISO 9660

What do *classical* data mastering applications use?

Software like »Easy CD Creator«, »Nero«, »WinOnCD«, ...
put on CD:

- ISO 9660

Almost always

- ☞ which is a good idea for max. compatibility with other systems

Software like »Easy CD Creator«, »Nero«, »WinOnCD«, ...
put on CD:

- ISO 9660

Almost always

☞ which is a good idea for max. compatibility with other systems

- Joliet

Almost always

☞ long file names help readability and recognition

So, what is my recommendation?

Usage of ISO 9660

What do *classical* data mastering applications use?

Software like »Easy CD Creator«, »Nero«, »WinOnCD«, ...
put on CD:

- ISO 9660

Almost always

☞ which is a good idea for max. compatibility with other systems

- Joliet

Almost always

☞ long file names help readability and recognition

So, what is my recommendation?

Recommendation for JACoW

 Let us use ISO 9660 with the Joliet extension

Recommendation for JACoW

 Let us use ISO 9660 with the Joliet extension

Recommendation for JACoW

☞ Let us use ISO 9660 with the Joliet extension

☞ So, drop the uppercased 8.3 names

Recommendation for JACoW

 Let us use ISO 9660 with the Joliet extension

 So, drop the uppercased 8.3 names

Recommendation for JACoW

☞ Let us use ISO 9660 with the Joliet extension

☞ So, drop the uppercased 8.3 names

And to answer the question:

»How relevant is the **ISO 9660** Standard in today's world for JACoW?«

Recommendation for JACoW

☞ Let us use ISO 9660 with the Joliet extension

☞ So, drop the uppercased 8.3 names

And to answer the question:

»How relevant is the **ISO 9660** Standard in today's world for JACoW?«

Recommendation for JACoW

👉 Let us use ISO 9660 with the Joliet extension

👉 So, drop the uppercased 8.3 names

And to answer the question:

»How relevant is the **ISO 9660** Standard in today's world for JACoW?«

👉 Very important, but we should use the Joliet extension!

Recommendation for JACoW

👉 Let us use ISO 9660 with the Joliet extension

👉 So, drop the uppercased 8.3 names

And to answer the question:

»How relevant is the **ISO 9660** Standard in today's world for JACoW?«

👉 Very important, but we should use the Joliet extension!

Thank you!
