# STATISTICAL AND PARAMETRIC UNCERTAINTIES

## SOME FACTS WE AGREE UPON

- **PDF UNCERTAINTIES** AS GIVEN BY NNPDF REPLICAS OR CTEQ ERROR SETS FOR FIXED  $\alpha_s$  **ARE JUST STATISTICAL UNCERTAINTIES**  
THEY **NEEDN'T BE GAUSSIAN** (EG BECAUSE OF POSITIVITY BOUNDS) **BUT OFTEN ARE TO GOOD APPROXIMATION**
- **PDF UNCERTAINTIES** REFLECT THE UNCERTAINTIES IN THE DATA USED TO DETERMINE THE PDF; THEY ARE THUS USUALLY **UNCORRELATED** TO OTHER UNCERTAINTIES  
example of (admittedly baroque) exception: one PDF combination (eg  $s - \bar{s}$ ) determined by one single dataset whose normalization is correlated to that of process which is being predicted  
THEY **DO INDUCE CORRELATION BETWEEN DIFFERENT PDFs IN SAME SET**
- **PARAMETRIC UNCERTAINTIES** SUCH AS THE UNCERTAINTY ON  $\alpha_s$  ARE **USUALLY GAUSSIAN**  
THEY **AFFECT BOTH THE PARTONIC CROSS SECTIONS AND THE PDFs IN A CORRELATED WAY** (OFTEN STRONGLY CORRELATED)
- **CORRELATIONS BETWEEN PARM UNCERTAINTIES OF XSECT & PDF** MUST BE KEPT INTO ACCOUNT,  
E.G. BY USE PDFs DETERMINED USING THE SAME  $\alpha_s$  VALUE ADOPTED IN THE MATRIX ELEMENT, AND VARYING BOTH SIMULTANEOUSLY

# THEORETICAL UNCERTAINTIES

- DUE TO UNKNOWN HIGHER ORDER TERMS
- CLEARLY PRESENT BOTH IN PROCESSES USED FOR PDF DETERMINATION  
⇒ THEORETICAL UNCERTAINTY ON PDFs AND IN PROCESSES COMPUTED  
USING A GIVEN PDF SET ⇒ THEORETICAL UNCERTAINTY ON PROCESS
- THU ON PDF & ON PROCESS GENERALLY UNCORRELATED UNLESS PDF  
DETERMINATION IS DRIVEN MAINLY OR ENTIRELY BY ONE PROCESS, AND  
ONE IS LOOKING AT THE SAME (OR CLOSELY RELATED PROCESS)  
NOT IMPOSSIBLE, BUT UNUSUAL ⇒ UNCORRELATED TREATMENT MIGHT BE  
JUST VERY SLIGHTLY TOO CONSERVATIVE
- AT PRESENT THE ISSUE IS ACADEMIC: NO AVAILABLE PDF SET INCLUDES  
THESE UNCERTAINTIES
- WHAT IF WE DID TRY TO INCLUDE THEM?:
  - HOW COULD WE DO IT?
  - HOW LARGE MIGHT THEY BE?

# ESTIMATING THEORETICAL UNCERTAINTIES ON PDF

- **STANDARD WAY: FACTORIZATION & RENORMALIZATION SCALE VARIATION OF FACTORIZED QCD CROSS-SECTIONS**

$$\sigma(M^2, \tau) = \hat{\sigma} \left( \alpha_s(\mu_R^2), \frac{M^2}{\mu_F^2}, \frac{M^2}{\mu_R^2}, z \right) \otimes f(z, \mu_F^2)$$

$f \rightarrow$  PDF;  $\hat{\sigma} \rightarrow$  PARTONIC XSECT.,  $\sigma \rightarrow$  HADRONIC XSECT.;  $\otimes$  CONVOLUTION

- **HOW WOULD IT WORK FOR PDFS?**

## FACTORIZATION SCALE

- FACTORIZATION SCALE INDEPENDENCE IS A PROPERTY OF PHYSICAL OBSERVABLES: PDF IS  $\mu_f$  DEPENDENT!
- IMPOSE  $\frac{d\sigma}{d\mu_F^2} = 0$  TO FINITE PERTURBATIVE ORDER & USE RESULT TO DETERMINE DEPENDENCE OF  $\hat{\sigma} \left( \alpha_s(\mu_R^2), \frac{M^2}{\mu_F^2}, \frac{M^2}{\mu_R^2}, z \right)$  ON  $\mu_F^2$
- $\rightarrow \sigma(Q^2, \tau, \mu_F^2)$  ACQUIRES NEW SCALE DEPENDENCE: IT ESTIMATES SIZE OF HIGHER-ORDER CORRECTIONS TO  $\hat{\sigma}$
- PERFORMING VARIATION FOR PROCESSES USED IN PDF EXTRACTION WOULD GIVE UNCERTAINTY ON PDFS DUE TO MISSING HIGHER ORDERS IN THESE PROCESSES PDF ACQUIRE DEPENDENCE ON NEW SCALE  $\mu_F^{\text{fit}}$ :  $f(\mu_F, \mu_F^{\text{fit}})$  MODELS THU DUE TO MISSING HIGHER ORDERS
- $\mu_F^{\text{fit}}$  DEPENDENCE OF PDFS TOTALLY UNCORRELATED TO  $\mu_f$  DEPENDENCE OF PDFS
- $\mu_F^{\text{fit}}$  DEPENDENCE OF PDFS GENERALLY UNCORRELATED TO  $\mu_f$  DEPENDENCE OF  $\sigma(Q^2, \tau, \mu_F^2)$ , UNLESS PDF DETERMINATION DRIVEN MOSTLY BY  $\sigma(Q^2, \tau, \mu_F^2)$  WHICH IS BEING COMPUTED (SEE ABOVE).

# ESTIMATING THEORETICAL UNCERTAINTIES ON PDF

- **STANDARD WAY: FACTORIZATION & RENORMALIZATION SCALE VARIATION OF FACTORIZED QCD CROSS-SECTIONS**

$$\sigma(M^2, \tau) = \hat{\sigma} \left( \alpha_s(\mu_R^2), \frac{M^2}{\mu_F^2}, \frac{M^2}{\mu_R^2}, z \right) \otimes f(z, \mu_F^2)$$

$f \rightarrow$  PDF;  $\hat{\sigma} \rightarrow$  PARTONIC XSECT.,  $\sigma \rightarrow$  HADRONIC XSECT;  $\otimes$  CONVOLUTION

- **HOW WOULD IT WORK FOR PDFS?**

## RENORMALIZATION SCALE

- RENORMALIZATION SCALE INDEPENDENCE IS A **PROPERTY OF EITHER THE PHYSICAL OBSERVABLE** ( $\mu_R^2$  INDEP AT FIXED  $Q^2$ ) OR THE PDF ( $\mu_R^2$  INDEP AT FIXED  $\mu_F^2$ )
- IMPOSE  $\frac{d\sigma}{d\mu_R^2} = 0$  TO FINITE PERTURBATIVE ORDER  
& USE RESULT TO DETERMINE DEPENDENCE OF  $\hat{\sigma} \left( \alpha_s(\mu_R^2), \frac{M^2}{\mu_F^2}, \frac{M^2}{\mu_R^2}, z \right)$  ON  $\mu_R^2$
- $\rightarrow \sigma(Q^2, \tau, \mu_R^2)$  ACQUIRES NEW SCALE DEPENDENCE: IT ESTIMATES SIZE OF HIGHER-ORDER CORRECTIONS TO  $\hat{\sigma}$  BUT ALSO OF HIGHER ORDER CORRECTIONS TO EVOLUTION EQUATIONS
- **PERFORMING VARIATION FOR PROCESSES USED IN PDF EXTRACTION WOULD GIVE UNCERTAINTY ON PDFS DUE TO MISSING HIGHER ORDERS IN THESE PROCESSES BUT ALSO DUE TO MISSING HIGHER ORDERS IN PERTURBATIVE EVOLUTION PDF ACQUIRE DEPENDENCE ON NEW SCALE  $\mu_R$ :  $f(\mu_F, \mu_R)$**
- **PART (THOUGH NOT ALL) OF THIS UNCERTAINTY HIGHLY CORRELATED ACROSS PROCESSES**

# ESTIMATING THEORETICAL UNCERTAINTIES ON PDF

## TENTATIVE CONCLUSIONS

- THEORETICAL UNCERTAINTIES DUE TO MISSING HIGHER ORDERS IN PROCESSES USED FOR PDF EXTRACTION CURRENTLY NOT INCLUDED IN PDF FITS
- IF INCLUDED THEY WOULD BE ALMOST ENTIRELY UNCORRELATED TO THAT IN PROCESSES IN WHICH PDFs ARE SUBSEQUENTLY USED
- SCALE VARIATION APPEARS ESPECIALLY INEFFICIENT FOR THE ESTIMATION OF SUCH UNCERTAINTIES ON PDFs, AS IT INDUCES SPURIOUS CORRELATIONS
- METHODS BASED ON THE PERTURBATIVE BEHAVIOUR (CACCIARI-HOUDEAU) MORE PROMISING
- SUGGEST THEORETICAL UNCERTAINTIES ON PDFs IN COMPARISON TO CURRENT PDF UNCERTAINTIES ARE NEGLIGIBLE AT NNLO BUT NOT AT NLO

# THEORETICAL UNCERTAINTIES

NLO PDF UNCERTAINTIES VS NLO-NNLO SHIFT (NNPDF2.1)

NNLO KNOWN  $\Rightarrow$  NLO TH. UNCERTAINTIES KNOWN!

# THEORETICAL UNCERTAINTIES

## CRUDE IMPLEMENTATION OF THE CACCIARI-HOUDEAU METHOD

- ASSUME COEFFICIENT OF PERTURBATIVE EXPANSION BOUNDED FROM ABOVE AND WITH SOME (UNIFORM?) DISTRIBUTION
- ESTIMATE SIZE OF NEXT ORDER BASED ON KNOWN COEFFICIENTS

series in  $\alpha_s$  starting at  $\alpha_s^0$ ; uncertainty on  $k$ -th order:

$$\Delta_k = \begin{cases} \alpha_s^{k+1} \max\{|c_l|, \dots, |c_k|\} \frac{n_c+1}{n_c} p & \text{if } p \leq \frac{n_c}{n_c+1} \\ \alpha_s^{k+1} \max\{|c_l|, \dots, |c_k|\} [(n_c+1)(1-p)]^{-1/n_c} & \text{if } p > \frac{n_c}{n_c+1} \end{cases}$$

$n_c = k + 1$  number of known coefficients;  $P \Rightarrow$  c.l. (one  $\sigma \leftrightarrow P = 0.68$ )

# THE CACCIARI-HOUDEAU METHOD

## APPLICATION TO PDFs

- CONSIDER PDFs FOR GIVEN  $x, Q^2$  AS A SERIES IN  $\alpha_s$
- AT NLO USE FORMULA WITH  $k = 1$  ETC. (HENCEFORTH,  $\alpha_s = 0.119$ )
