DEALING WITH “SUSY LIMIT INFLATION” FOR THE EXPERIMENTAL PDG REVIEW

The Early SUSY Search Strategy

Complementary set of inclusive topology searches purely defined by experimental signature!

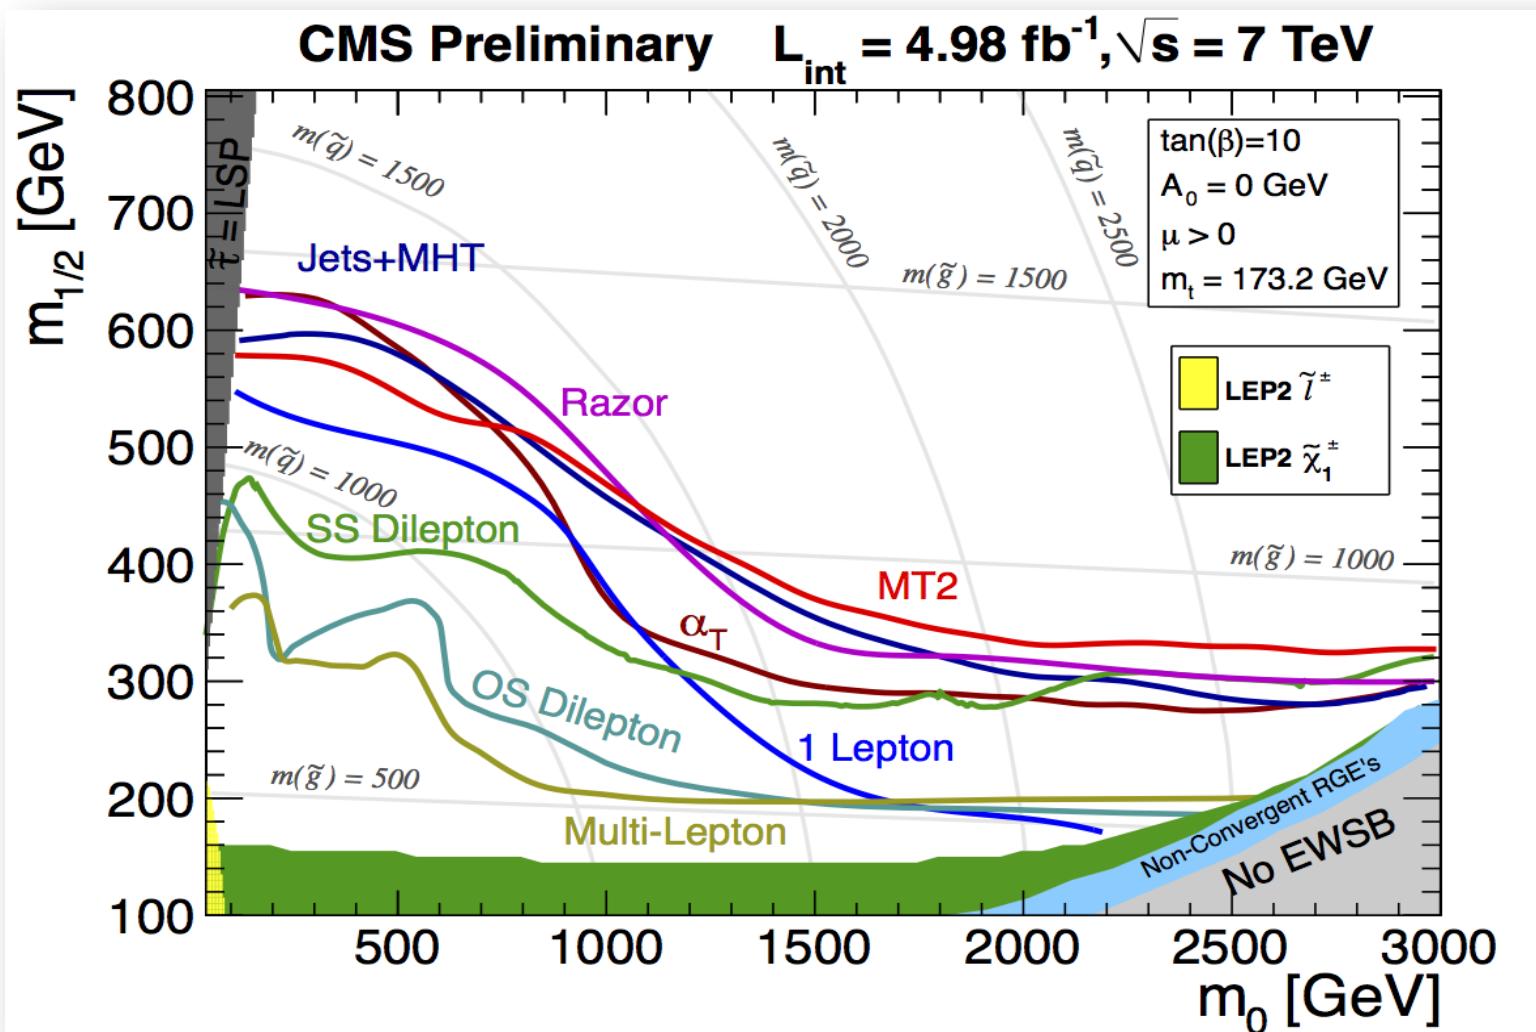

0-leptons	1-lepton	OSDL	SSDL	≥ 3 leptons	2-photons	$\gamma +$ lepton
Jets + MET	Single lepton + Jets + MET	Opposite-sign di-lepton + jets + MET	Same-sign di-lepton + jets + MET	Multi-lepton	Di-photon + jet + MET	Photon + lepton + MET

Bottom line:

Use the model of SUSY as overall guidance but
DO NOT tune the searches according to its details!

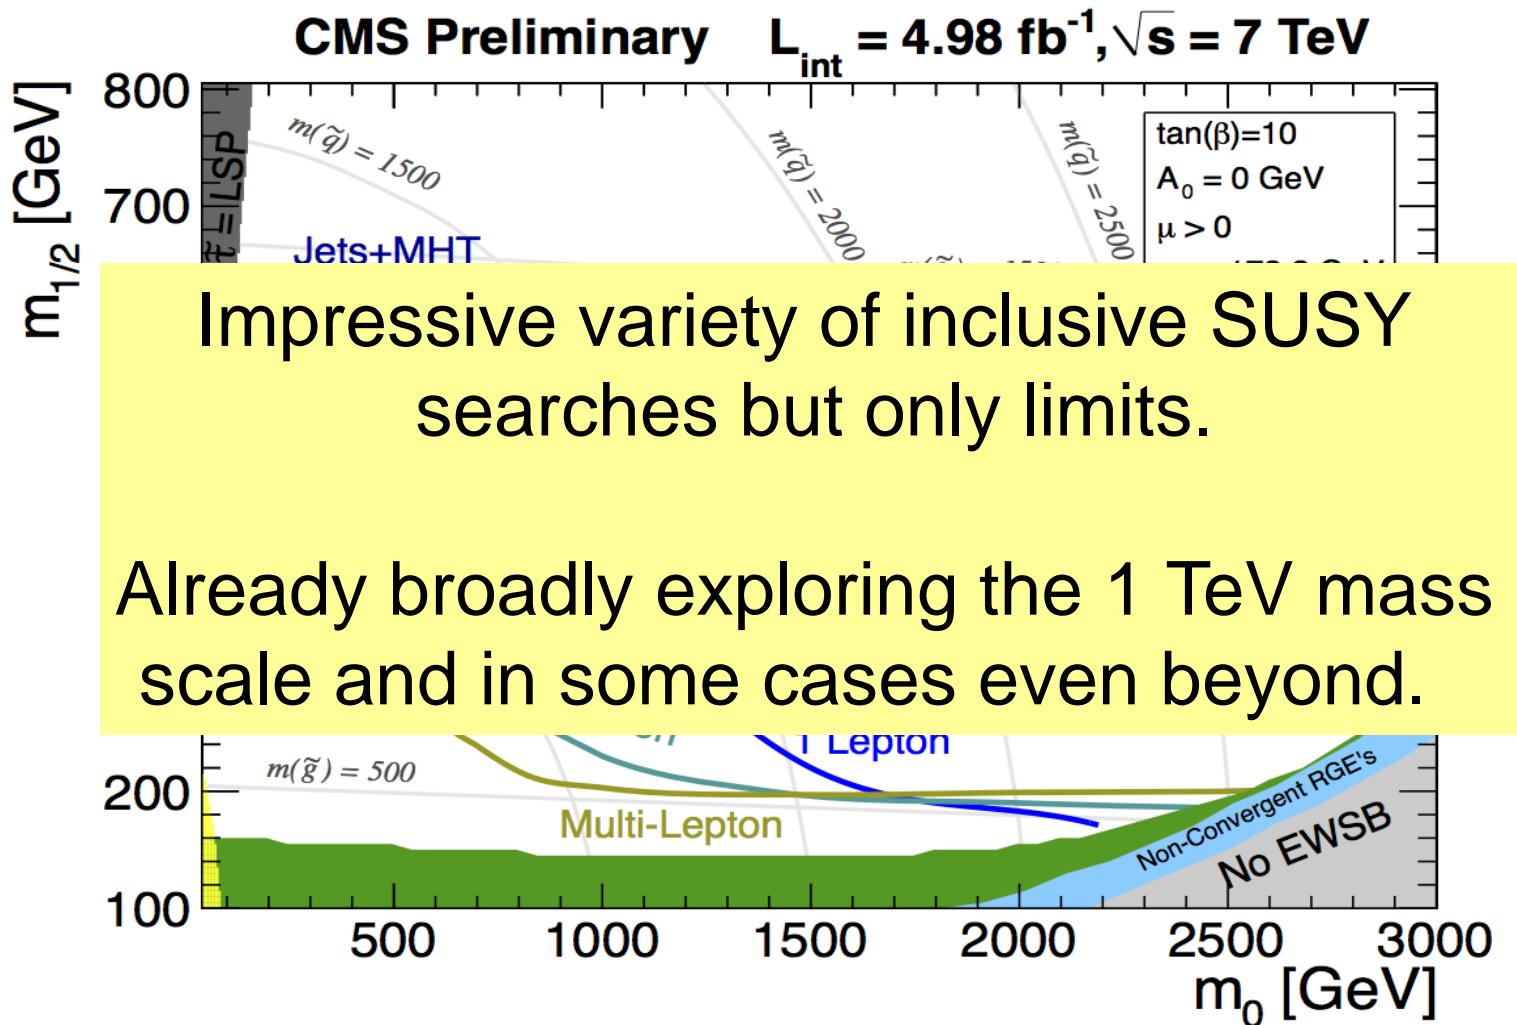

Inclusive SUSY Searches

Landscape in 2011:
Limits in CMSSM; Example CMS (ATLAS similar)

SUSY Status – post 7 TeV LHC data

- Constrained SUSY models like the CMSSM are severely put under pressure by the LHC limits!
- Experiments define new benchmarks and less complex SUSY models in order to present the interpretation of their searches.
- Aided by the discovery of a Higgs(-like) boson, to focus of the experimental search strategy and corresponding interpretation shifts towards “Natural SUSY”.

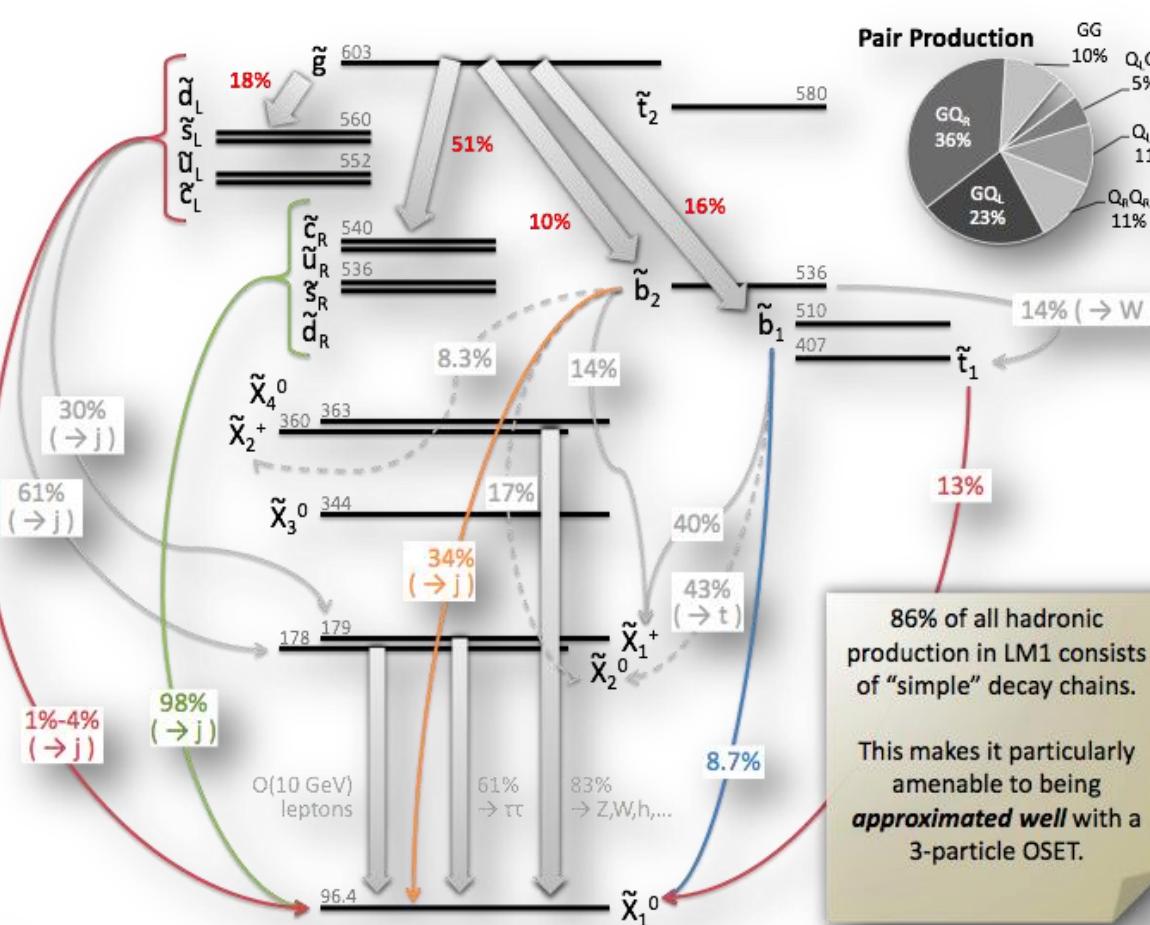

(Minimal) Natural SUSY Spectrum

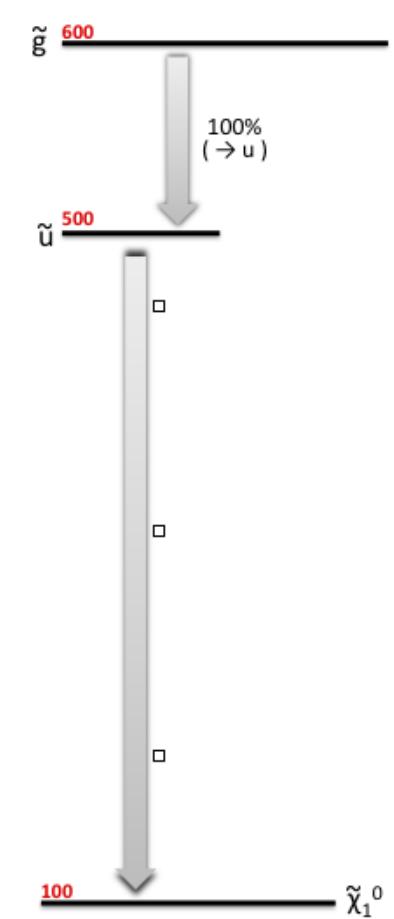

Use the argument of “naturalness” (i.e. fine-tuning) to motivate light 3rd generation squarks (especially stop) and a rather light gluino!

Interpretation in Simplified Models

CMSSM

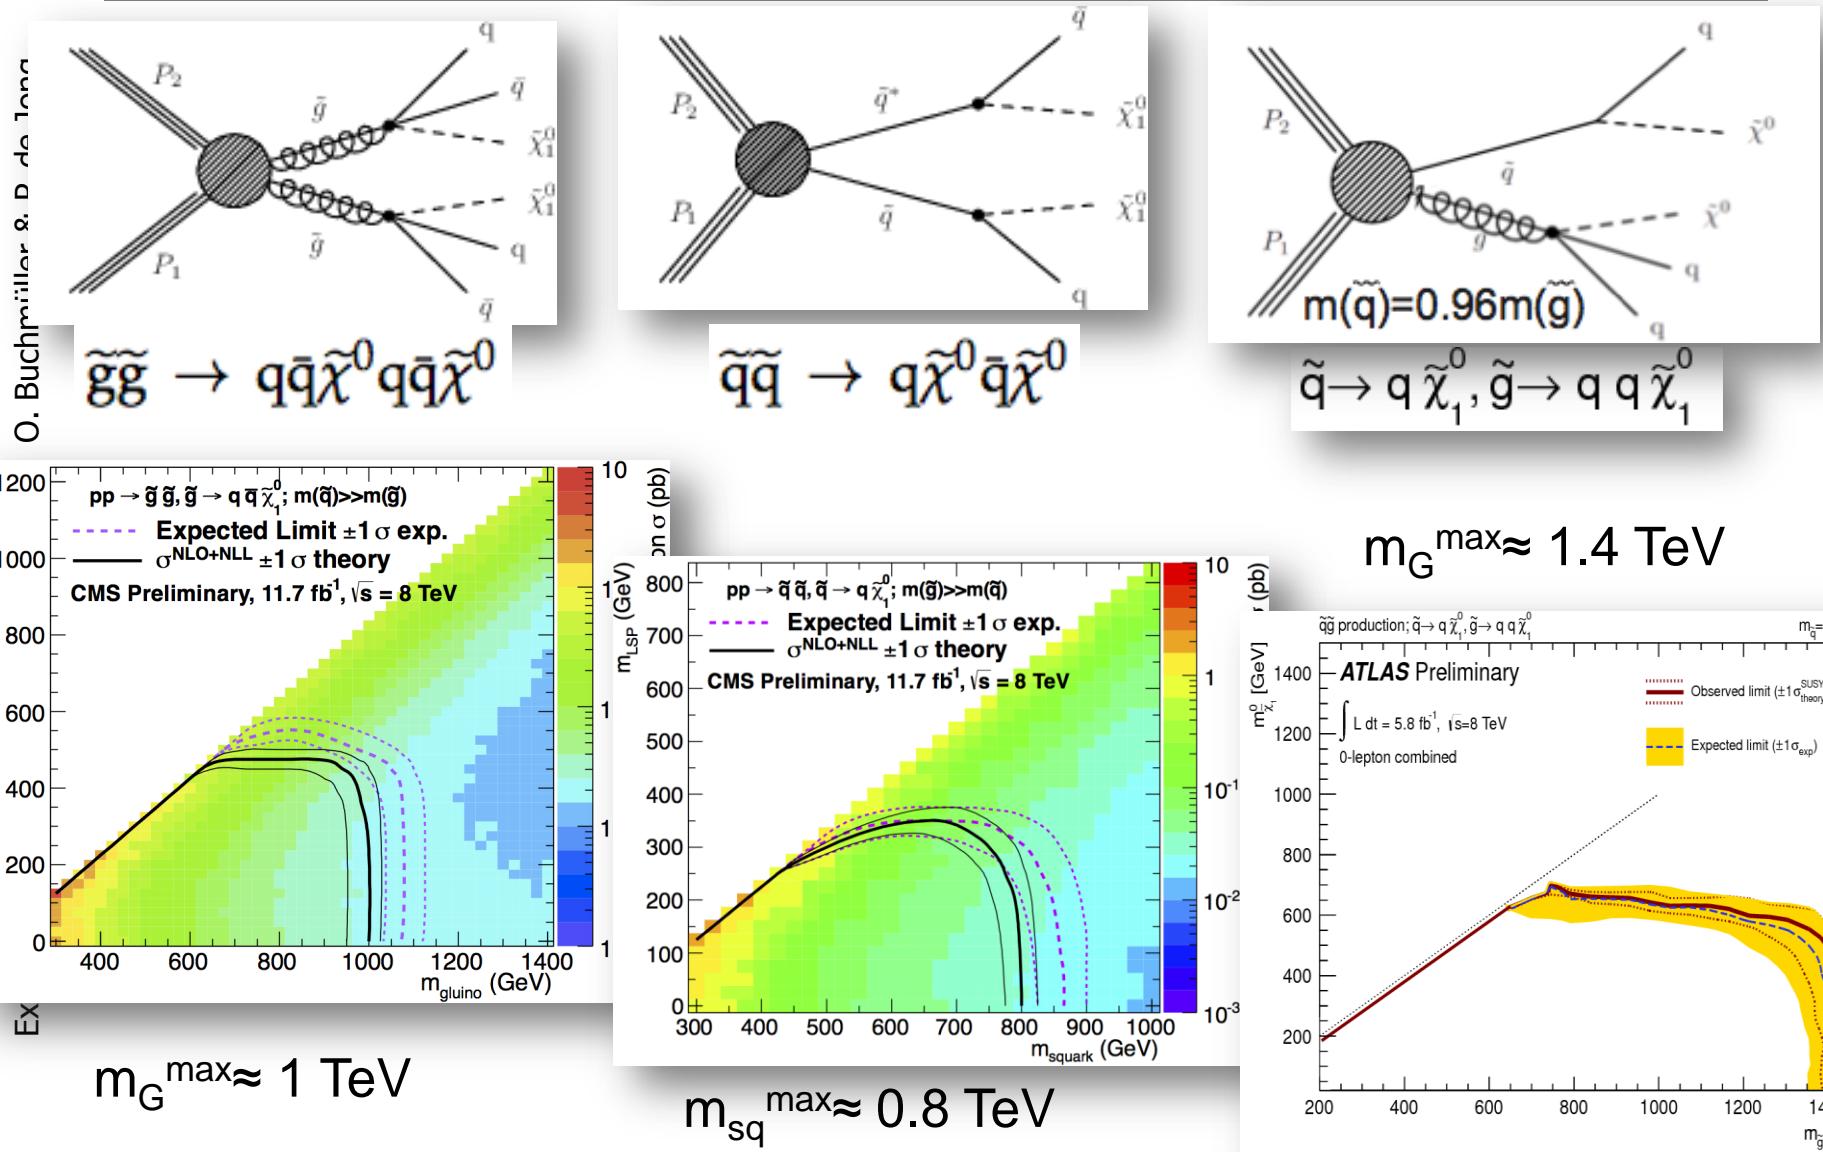

What the individual searches are sensitive to is much more simple...

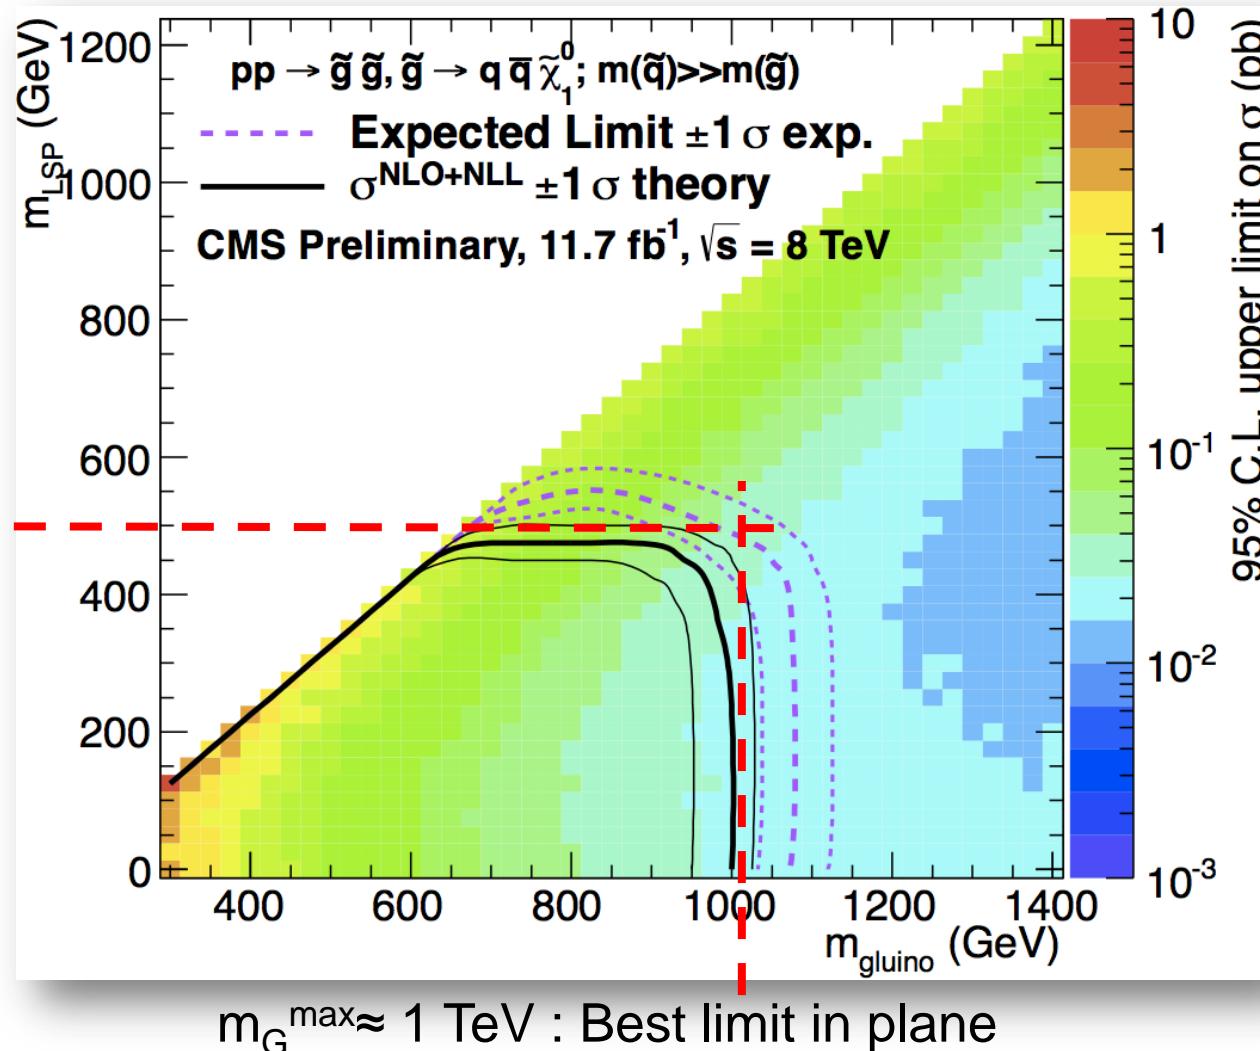

Simplified model spectrum or sms
with 3 particles, 2 decay modes

Simplified Model Spectra (SMS)

SMS: a few interesting features

$m_{\text{LSP}}^{\text{max}} \approx 0.5 \text{ TeV}$: LSP mass above which there is NO limit anymore

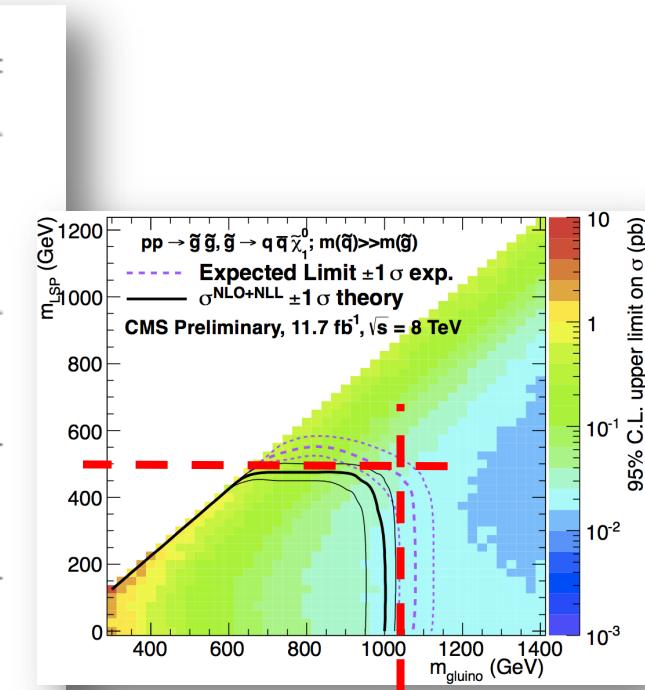

How to summarize SMS limits?

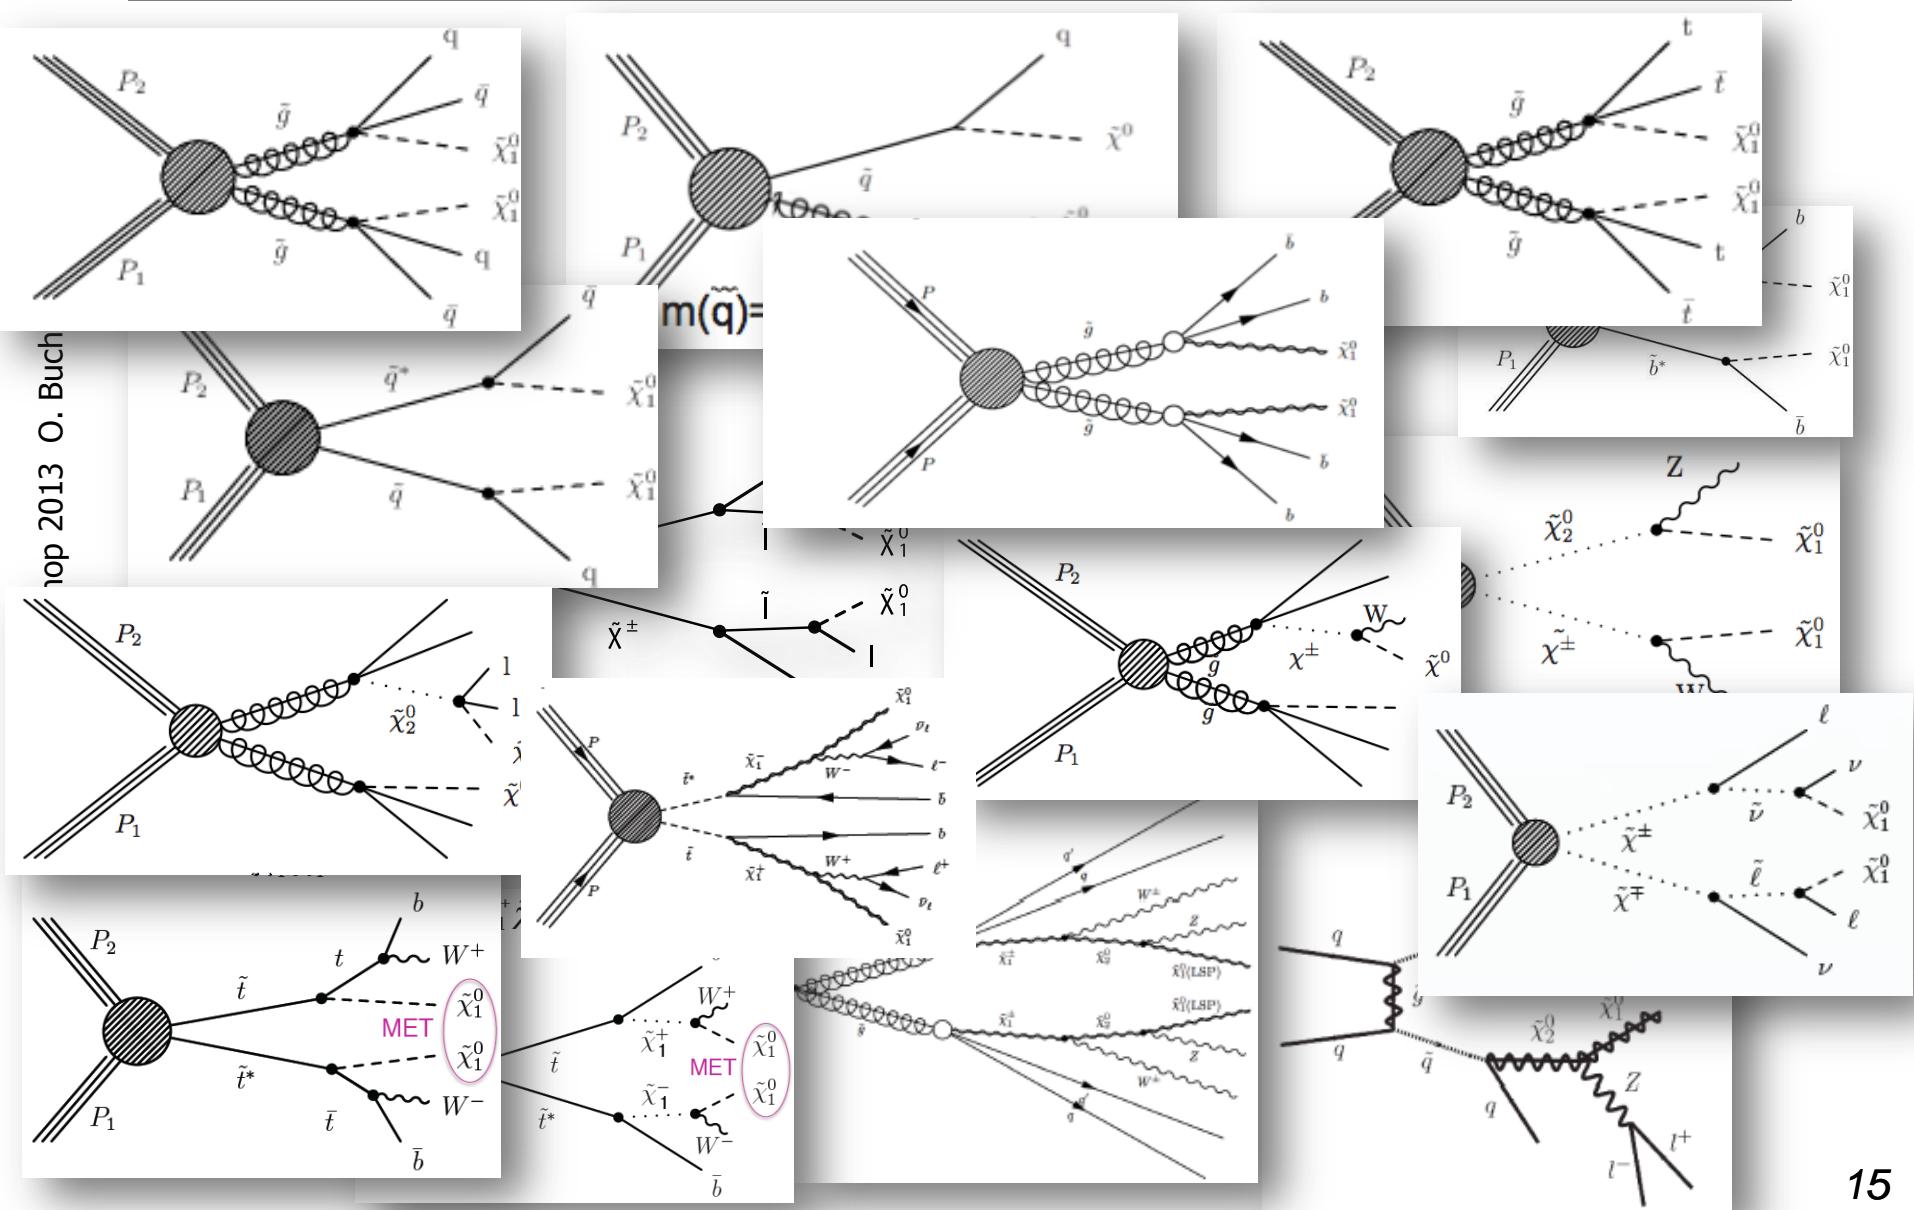

*Approach taken in the 2012 Experimental SUSY PDG review
[OB & Paul De Jong]:*

<http://pdg.lbl.gov/2012/reviews/rpp2012-rev-susy-2-experiment.pdf>

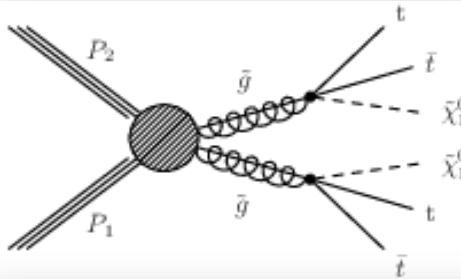

Model	Assumption	$m_{\tilde{q}}$	$m_{\tilde{g}}$
CMSSM	$m_{\tilde{q}} \approx m_{\tilde{g}}$	1400	1400
	all $m_{\tilde{q}}$	-	800
	all $m_{\tilde{g}}$	1300	-
Simplified model $\tilde{g}\tilde{g}$	$m_{\tilde{\chi}_1^0} = 0$	-	900
	$m_{\tilde{\chi}_1^0} > 300$	-	no limit
Simplified model $\tilde{q}\tilde{q}$	$m_{\tilde{\chi}_1^0} = 0$	750	-
	$m_{\tilde{\chi}_1^0} > 250$	no limit	-
Simplified model $\tilde{g}\tilde{q}, \tilde{g}\bar{\tilde{q}}$	$m_{\tilde{\chi}_1^0} = 0, m_{\tilde{q}} \approx m_{\tilde{g}}$	1500	1500
	$m_{\tilde{\chi}_1^0} = 0, \text{ all } m_{\tilde{g}}$	1400	-
	$m_{\tilde{\chi}_1^0} = 0, \text{ all } m_{\tilde{q}}$	-	900

Today: many different SMS are considered

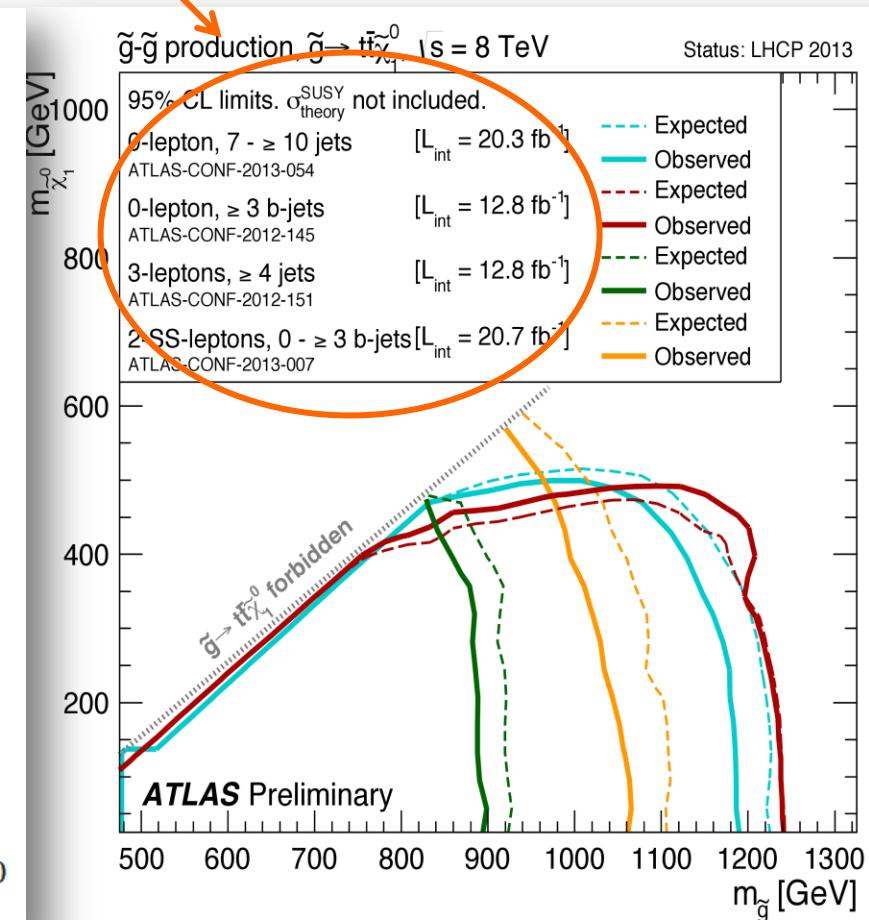

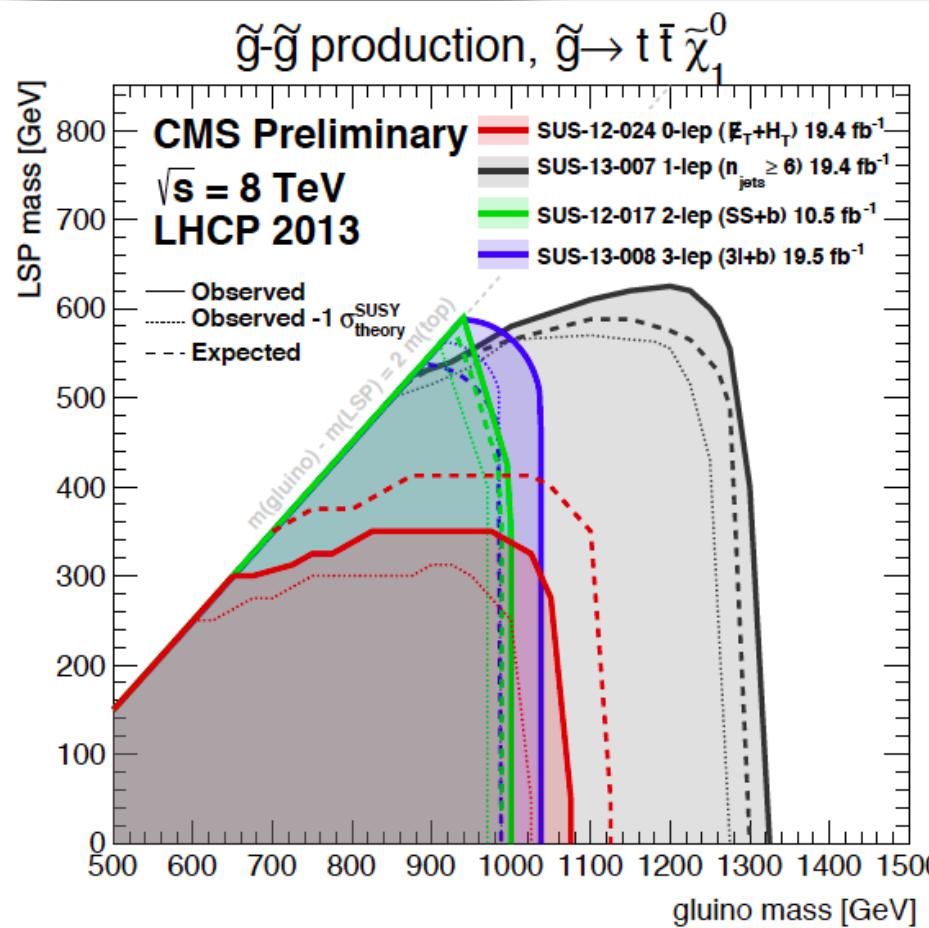

Today: many different searches per SMS

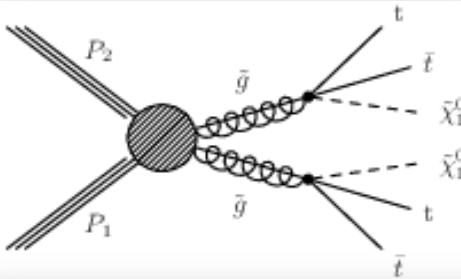

Example: gluino → top-top LSP

Several DEDICATED searches are interpret in this particular SMS.

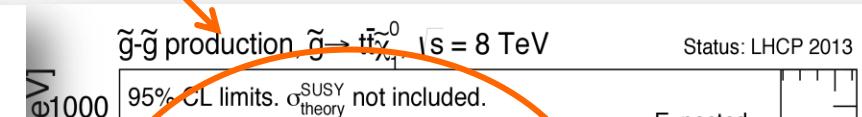

Today: many different searches per SMS

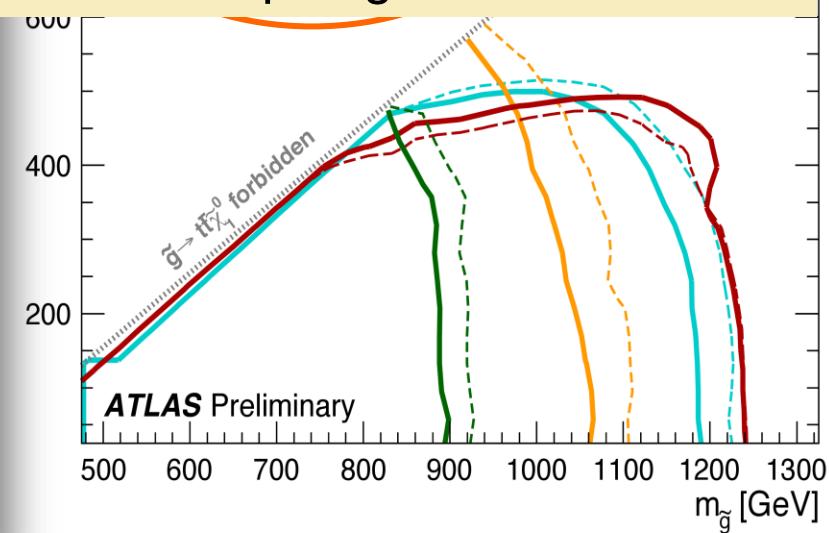

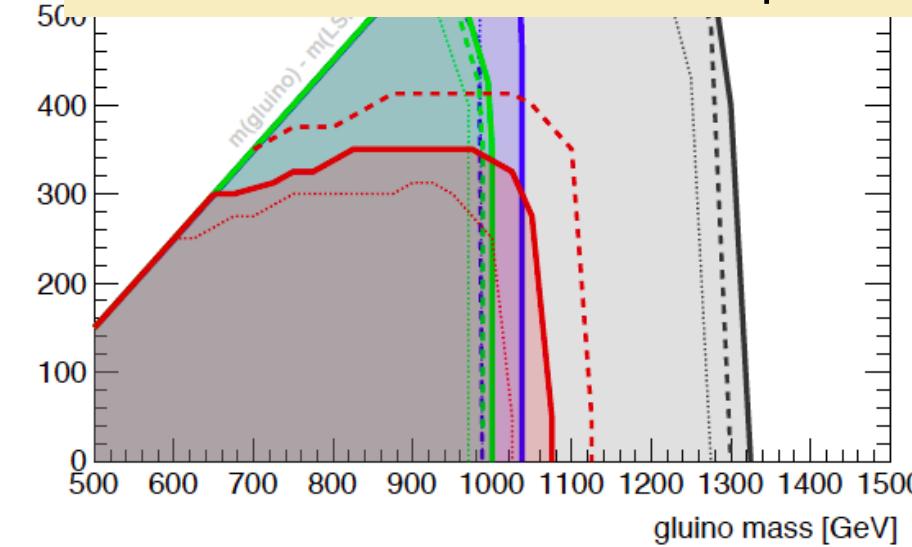

Example: gluino \rightarrow top-top LSP

Several DEDICATED searches are interpret in this particular SMS.

$\tilde{g}\tilde{g}$ production, $\tilde{g} \rightarrow t\bar{t}\tilde{\chi}_1^0$

Today, highly specialized searches like in this case e.g. 0 lepton and 7 to 10 jets or 1 lepton, more then 6 jets, and b-tag are used to push the limits. While this provides stringent limits for the target SMS, it is often unclear how these searches perform for other topologies.

Interpretation in Simplified Models

CMSSM

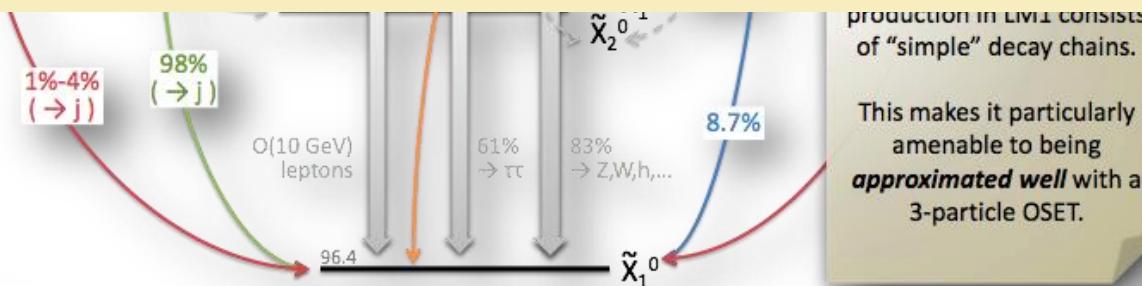

What the individual searches are sensitive to is much more simple...

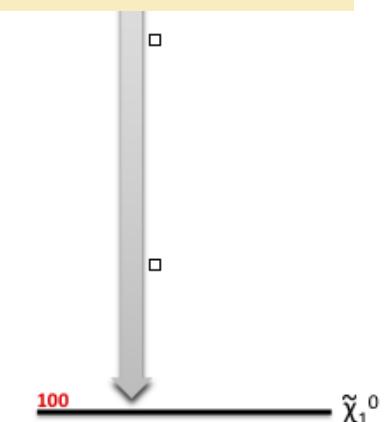

Going “simplified” after the constraint SUSY models was the next logical step. Yet, experiments have pushed this to a point where, perhaps, this strategy has become too simple and too specialized.

The challenge for the next experimental SUSY review:

How do we establish the big picture from all these individual SMS limits?

Simplified model spectrum or sms
with 3 particles, 2 decay modes

BACKUP

One possibility: Going back to the roots

Focus more on limits from inclusive topology searches:

i.e. complementary set of inclusive topology searches purely defined by experimental signature!

0-leptons	1-lepton	OSDL	SSDL	≥ 3 leptons	2-photons	$\gamma +$ lepton
Jets + MET	Single lepton + Jets + MET	Opposite-sign di-lepton + jets + MET	Same-sign di-lepton + jets + MET	Multi-lepton	Di-photon + jet + MET	Photon + lepton + MET

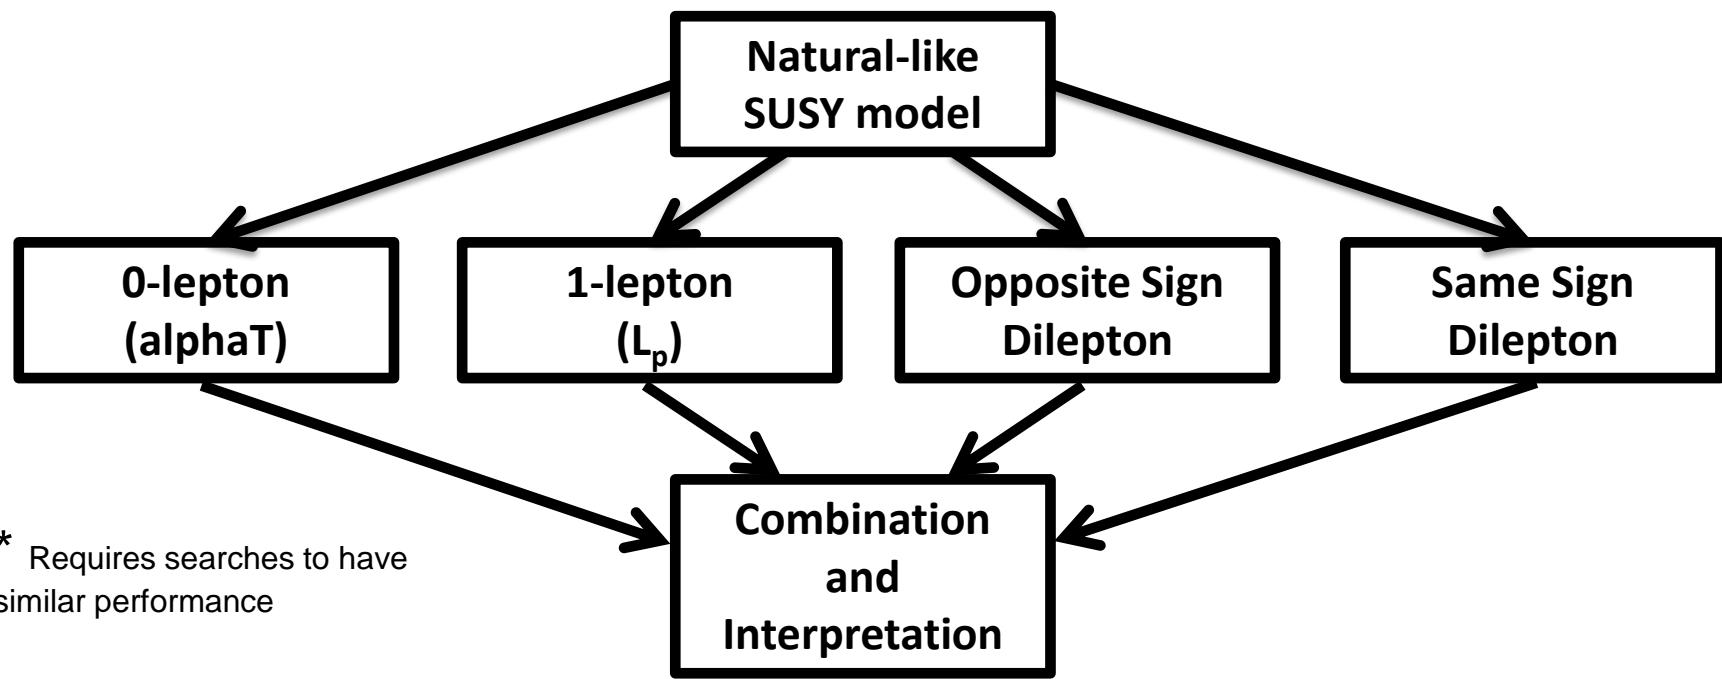

Why?

Combination of inclusive searches

General idea:

OB, J. Marrouchi arXiv:1304.2185

The combination of all relevant inclusive topology searches* should provide limits on sparticle masses that are independent on the details and complexity of the underlying SUSY spectrum/model.

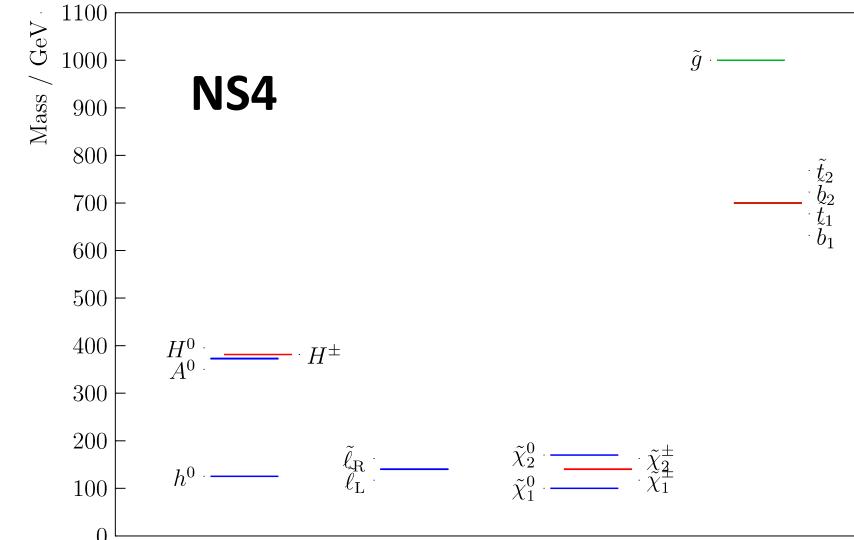

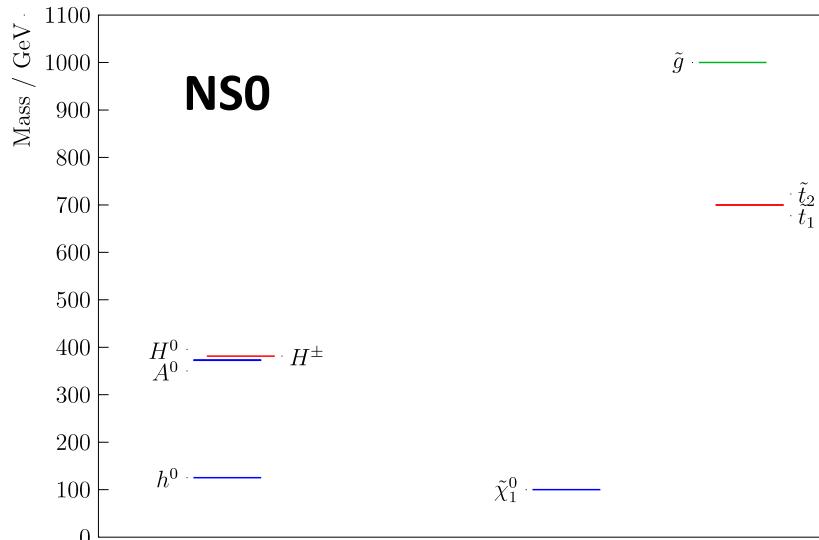

* Requires searches to have similar performance

Example: Natural SUSY spectra

Define (simplified) Natural-like SUSY spectra in terms of increasing complexity.

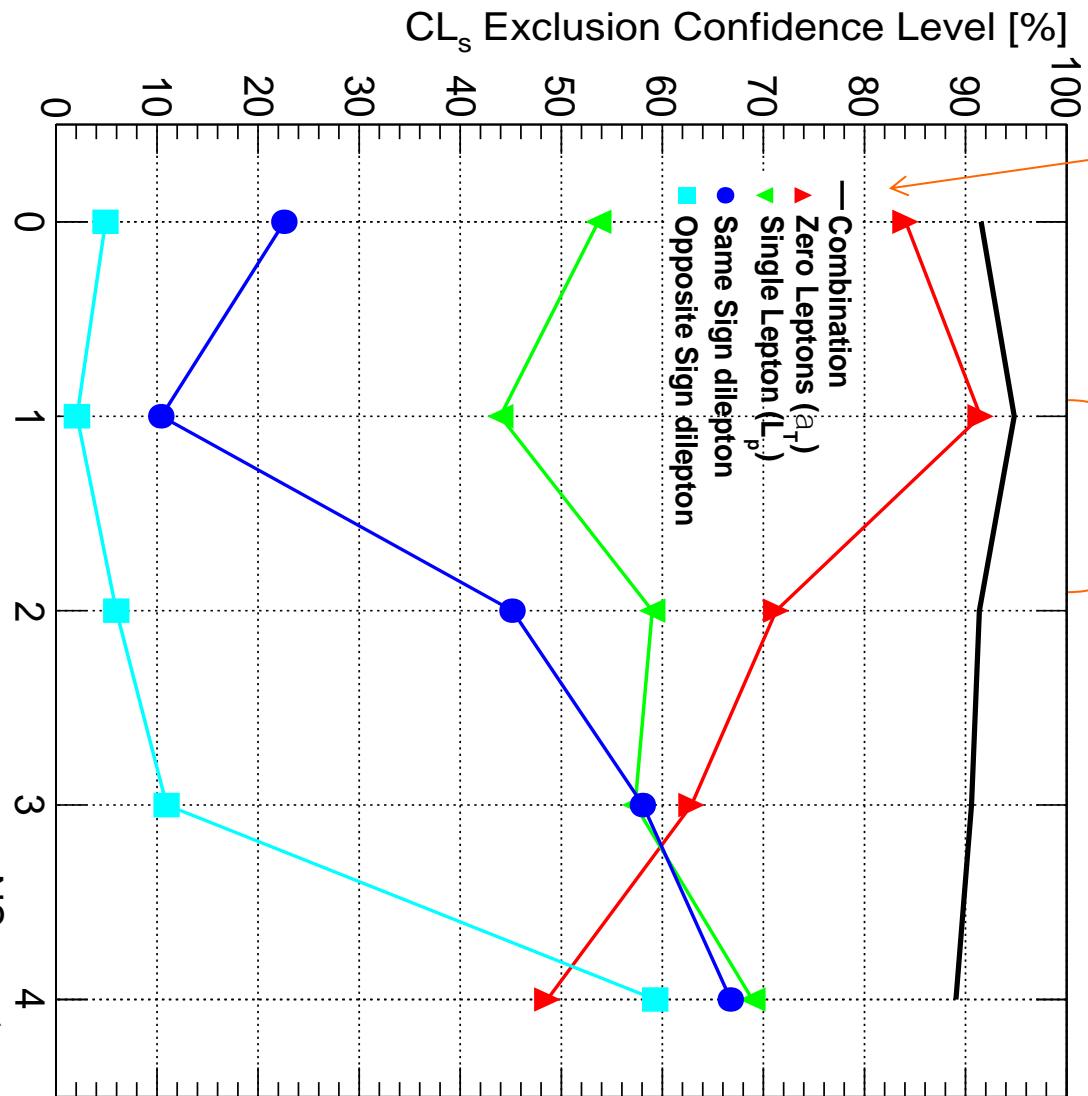

Three key parameters: gluino mass, average 3G squark mass and LSP mass.

Increasing complexity

Spectra	NS0	NS1	NS2	NS3	NS4
	\tilde{g} \tilde{t}_1, \tilde{t}_2 $\tilde{\chi}_0^1$	\tilde{g} $\tilde{t}_1, \tilde{t}_2, \tilde{b}_1$ $\tilde{\chi}_0^1$	\tilde{g} $\tilde{t}_1, \tilde{t}_2, \tilde{b}_1, \tilde{b}_2$ $\tilde{\chi}_0^2$ $\tilde{\chi}^\pm$ $\tilde{\chi}_0^1$	\tilde{g} $\tilde{t}_1, \tilde{t}_2, \tilde{b}_1, \tilde{b}_2$ $\tilde{\chi}_0^2$ $\tilde{\chi}^\pm$ $\tilde{\chi}_0^1$	\tilde{g} $\tilde{t}_1, \tilde{t}_2, \tilde{b}_1, \tilde{b}_2$ $\tilde{\chi}_0^2$ $\tilde{\chi}^\pm, \tilde{\ell}_{L,R}$ $\tilde{\chi}_0^1$
sparticle content					

Combination vs individual search

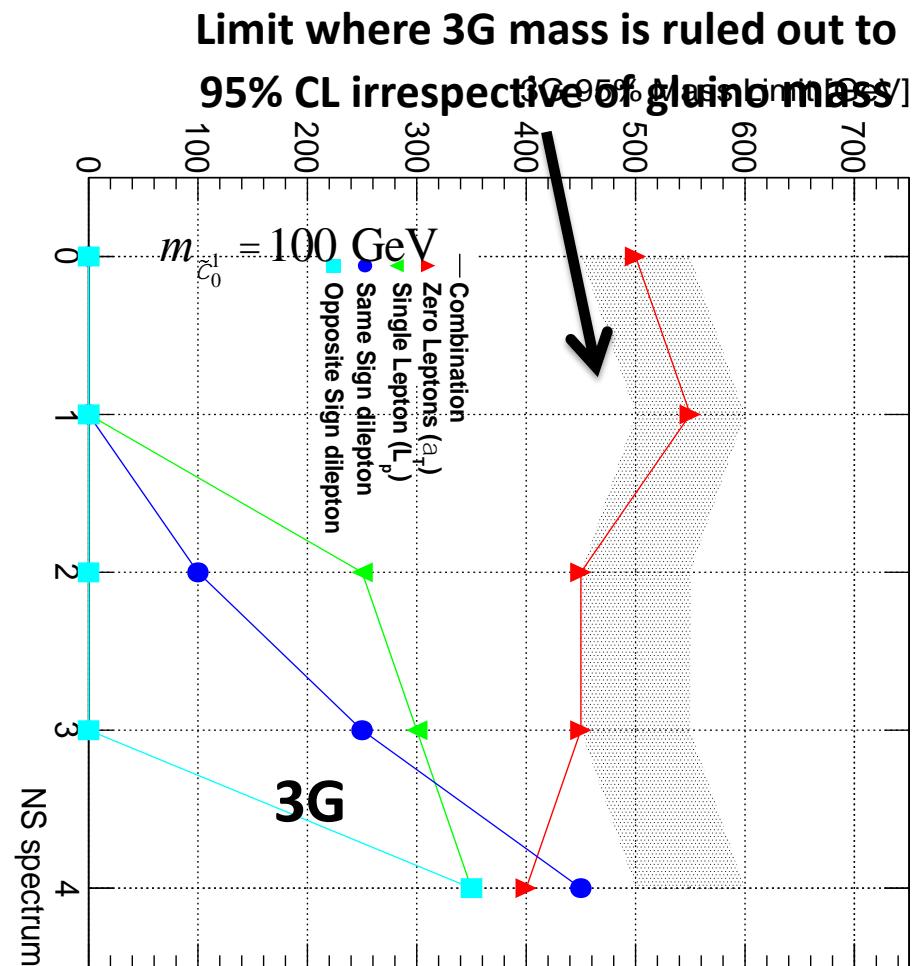

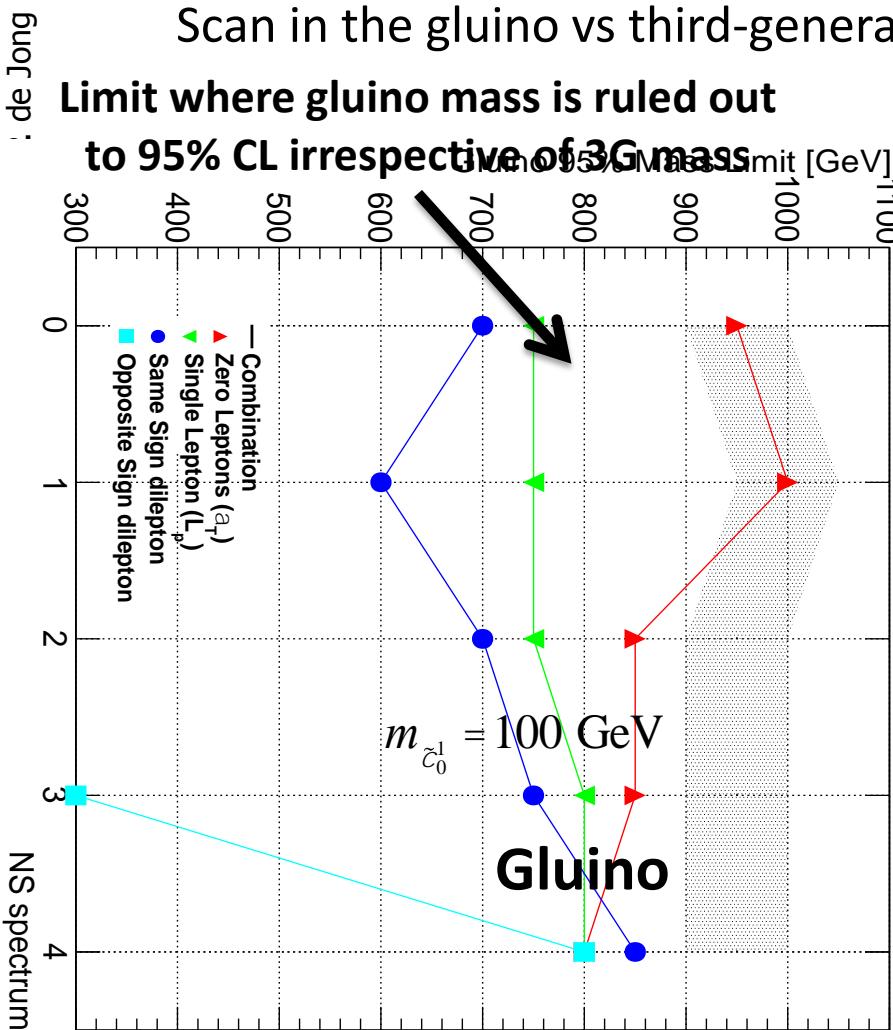

Combination of
searches stable

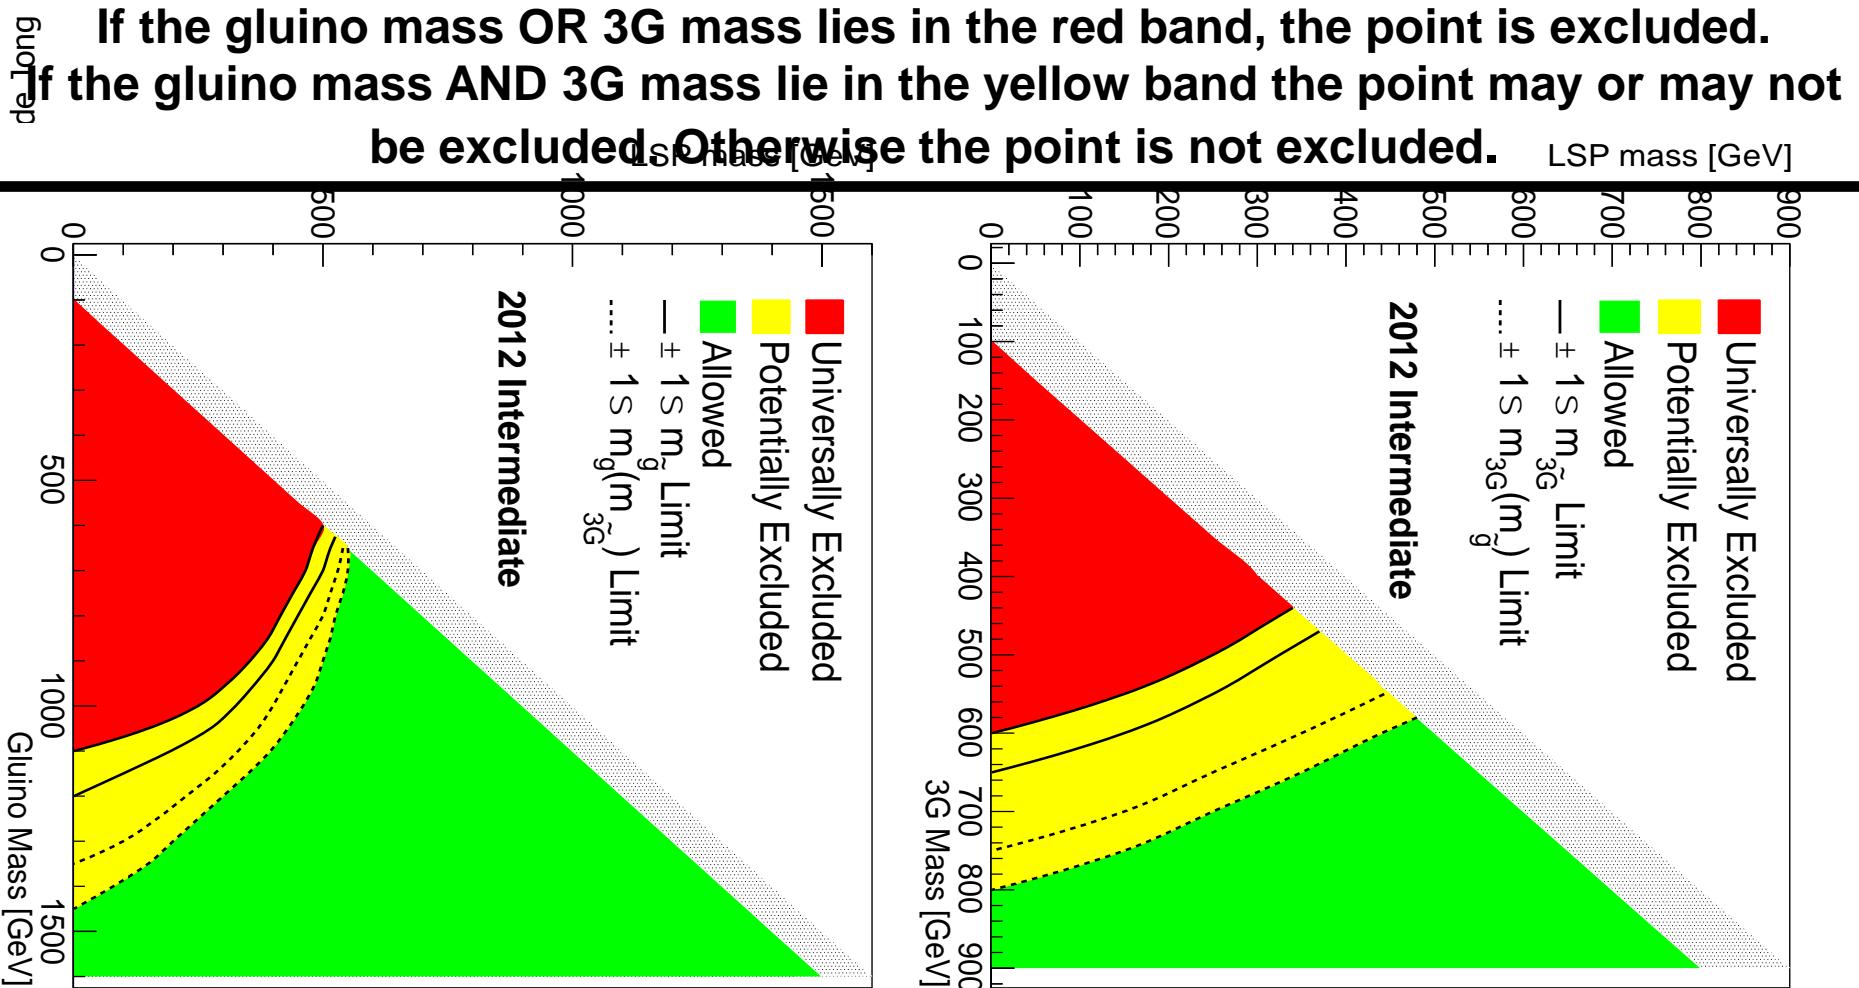

Individual
searches exhibit
large variations

Combinations is stable vs.
complexity while individual
searches are NOT!

Combination provides universal limits

Natural SUSY: universal limits

Combining with the latest published 8 TeV results:
