

# A theoretical review of triple Higgs coupling studies at the LHC

*Deep Inelastic Conference 2014, Warsaw, Poland*

**Julien Baglio** | 2014, April 30<sup>th</sup>

INSTITUT FÜR THEORETISCHE PHYSIK

- 1 Introduction
- 2 SM Higgs pair production at the LHC
- 3 Status of the studies of the triple Higgs coupling in the SM
- 4 BSM studies of the triple Higgs coupling (bibliography)
- 5 Outlook

# Motivation: probing the Brout-Englert-Higgs potential

- **From the scalar potential before EWSB:** with a scalar  $SU(2)$ -doublet field  $\phi$ ,  $Y_\phi = 1$ :

$$V(\phi) = -m^2|\phi|^2 + \lambda|\phi|^4$$

- $V(\phi)$  after EWSB, with  $M_H^2 = 2m^2$ ,  $v^2 = m^2/\lambda$ :

$$\phi = \begin{pmatrix} 0 \\ v + \frac{H(x)}{\sqrt{2}} \end{pmatrix} \Rightarrow V(H) = \frac{1}{2}M_H^2 H^2 + \frac{1}{2} \frac{M_H^2}{v} H^3 + \frac{1}{8} \frac{M_H^2}{v^2} H^4 + \text{constant}$$

$$\frac{3M_H^2}{v} \times (-i)$$

$$\frac{3M_H^2}{v^2} \times (-i)$$

- **Quartic Higgs coupling:** not accessible at current or foreseen collider energies ( $\leq 100$  TeV) [Plehn, Rauch, Phys.Rev. D72 (2005) 053008]
- **Triple Higgs coupling:** the ultimate probe of the shape of the SM Brout-Englert-Higgs potential
- **BSM physics:** triple Higgs coupling can depend on gauge parameters (for example in SUSY) and be enhanced

## ■ Early studies at lepton colliders:

- Studies at a **2 TeV  $e^+e^-$  collider**: SM triple Higgs coupling could be measured with a **10% accuracy** for a light Higgs, in  $\nu_e\bar{\nu}_e HH$  and  $W^+W^- HH$  modes (VBF modes)  
[Boudjema, Chopin, Z.Phys. C73 (1996) 85]
- Complementary SM and MSSM studies: in addition to weak boson fusion, associated Higgs production with a weak gauge boson and triple Higgs production; **500 GeV  $e^+e^-$  collider could be enough for a 20% accuracy on the triple Higgs coupling**  
[Djouadi, Kilian, Muhlleitner, Zerwas, Eur.Phys.J. C10 (1999) 27]

## ■ Early studies at the LHC:

- **First study at the LHC**: theoretical predictions for  $HH$  production in the main channels, in the SM and MSSM [Djouadi, Kilian, Muhlleitner, Zerwas, Eur.Phys.J. C10 (1999) 45]
- **Comprehensive analysis of the  $b\bar{b}\gamma\gamma$  channel**: with a very high luminosity ( $6000 \text{ fb}^{-1}$ )  $\lambda = 0$  can be excluded at 90% CL  
[Baur, Plehn, Rainwater, Phys.Rev.Lett. 89 (2002) 151801; Phys.Rev. D67 (2003) 033003; Phys.Rev. D69 (2004) 053004]

# SM Higgs pair production at the LHC

# The main production channels

- gluon fusion

NNLO in QCD  
(see next slides)

- vector boson fusion

NNLO in QCD  
(see next slides)

- double Higgs-strahlung

NNLO in QCD

[J.B. *et al*, JHEP 1304 (2013) 151]

- associated production with top quark

NLO in QCD

[Frederix *et al*, Phys.Lett. B732 (2014) 142]

$\sim 1000$  times smaller than  $\sigma(pp \rightarrow H + X)$

[J.B. *et al*, JHEP 1304 (2013) 151]

# Gluon fusion: the largest cross section

**LO** inclusive cross section known exactly ( $t + b$  loops) [Eboli *et al*, Phys.Lett. B197 (1987) 269; Glover, v.d. Bij, Nucl.Phys. B309 (1988) 282; Dicus, Kao, Willenbrock, Phys.Lett. B203 (1988) 457; Plehn, Spira, Zerwas, Nucl.Phys. B479 (1996) 46]

**QCD corrections to inclusive rate in the low energy limit  $\sqrt{s} \ll m_t$ :** **NLO** corrections [Dawson, Dittmaier, Spira, Phys.Rev. D58 (1998) 115012] + **NNLO** corrections (**new in 2013!**), **+20% on top of NLO rate** [De Florian, Mazzitelli, Phys.Lett. B724 (2013) 306; Phys.Rev.Lett. 111 (2013) 201801]

**NLO (NNLO)  $K$ -factor  $\simeq 2$  (2.3)**

$\sqrt{s}$ [TeV]	$\sigma^{\text{NLO}}$ [fb]	$\sigma^{\text{NNLO}}$ [fb]
8	8.2	9.8
14	33.9	40.2
33	207.3	242
100	1417.8	1638

**NNLL resummation:**  $\simeq +20 - 30\%$  on top of NLO cross section, scale dependence stabilized

[Shao, C.S. Li, H.T. Li, Wang, JHEP 1307 (2013) 169]

# Gluon fusion: theoretical uncertainties

$gg \rightarrow HH$  affected by sizeable uncertainties:

- **Scale uncertainty:** calculated at NLO with  $\frac{1}{2}\mu_0 \leq \mu_R, \mu_F \leq 2\mu_0$ ,  $\mu_0 = M_{HH}$   
 $\Delta^{\text{scale}} \simeq +20\%(+12\%)/-17\%(-10\%)$  at  $\sqrt{s} = 8(100)$  TeV
- **PDF uncertainty:** gluon PDF at high- $x$  less constrained,  $\alpha_s(M_Z^2)$  uncertainty  
 $\Delta_{90\%CL}^{\text{PDF}+\alpha_s} \simeq \pm 9\%$  ( $\simeq \pm 6\%$  at 100 TeV) uncertainty
- **EFT approximation:** NLO correction only known in a **top mass expansion (new 2013!)**  
 $\Rightarrow$  estimate of  $\pm 10\%$  uncertainty [Grigo, Hoff, Melnikov, Steinhauser, Nucl.Phys. B875 (2013) 1]

**Total uncertainty:**  $\simeq \pm 40\%$  ( $\simeq \pm 30\%$  at 100 TeV) [J.B. *et al*, JHEP 1304 (2013) 151]

**With recent NNLO calculation, scale uncertainty reduced to  $\pm 9\%$  ( $\pm 6\%$ ) at 8 (100) TeV**

[De Florian, Mazzitelli, Phys.Rev.Lett. 111 (2013) 201801]

# Vector boson fusion at NLO

$pp \rightarrow qq \rightarrow qq WW/ZZ \rightarrow qqHH$ : the second production channel at the LHC

**LO** inclusive cross section known for a while [Keung, Mod.Phys.Lett. A2 (1987) 765; Eboli *et al.*, Phys.Lett. B197 (1987) 269; Dicus, Kao, Willenbrock, Phys.Lett. B203 (1988) 457; Dobrovolskaya, Novikov, Z.Phys. C52 (1991) 427]

**QCD corrections: NLO corrections to inclusive rates and differential distributions** [J.B. *et al.*, JHEP 1304 (2013) 151] **implemented in VBFNLO (and now publicly available!)** [Arnold *et al.* Comput.Phys.Comm. 180 (2009) 1661; J.B. *et al.*, arXiv:1404.3940]

$\simeq +7\%$  correction  
(similar to single Higgs case)

$\sqrt{s}$ [TeV]	$\sigma^{\text{NLO}}$ [fb]
8	0.49
14	2.01
33	12.05
100	79.55

$qq \rightarrow HHqq$  is a clean process:

- **Scale uncertainty:** calculated at NLO with  $\frac{1}{2}\mu_0 \leq \mu_R, \mu_F \leq 2\mu_0$ ,  $\mu_0 = Q_{W/Z}$ ;  
 $\Delta^{\text{scale}} \simeq +3\%(+2\%)/-2\%(-1\%)$  at  $\sqrt{s} = 8(33)$  TeV  
 Good precision compared to LO  $\Delta^{\text{scale}} \simeq \pm 10\%$
- **PDF uncertainty:** total  $\Delta_{90\%CL}^{\text{PDF}+\alpha_s} \simeq +7\%/-4\%$  ( $\simeq +5\%/-4\%$  at 33 TeV)

**Total uncertainty:**  $\simeq +8\%/-5\%$  (14 TeV) [J.B. *et al*, JHEP 1304 (2013) 151]

**NNLO QCD corrections in the structure function approach:**  $+0.5\%$  on top of the NLO result, scale uncertainty at the percent level [L. Liu-Sheng *et al*, Phys.Rev. D89 (2014) 073001]

## Progress in 2014: Monte-Carlo tools including parton shower:

- $gg \rightarrow HH$  merged to 1 jet: **HERWIG++ implementation** of  $HH + 1j$  production with real radiation merged to parton shower  $\Rightarrow$  **10% theoretical uncertainty on the efficiencies of the cuts**, much better than unmerged samples [Maierhöfer, Papaefstathiou, JHEP 1403 (2014) 126]
- All main processes interfaced with parton shower in the **ac@NLO framework**: **fully differential predictions at NLO for all channels** [Frederix *et al*, Phys.Lett. B732 (2014) 142]

# Status of the studies of the $HHH$ coupling in the SM

**Where to look for HH production?** production cross section small  $\Rightarrow$  use  $H \rightarrow b\bar{b}$  decay channel at least once to retain some signal; foreseen luminosity at the LHC of  $3000 \text{ fb}^{-1}$

4 interesting final states *a priori*:

- $b\bar{b}W(\rightarrow \ell\nu)W(\rightarrow \ell\nu)$ : difficult because of MET, not promising [J.B. *et al*, JHEP 1304 (2013) 151]
- $b\bar{b}W(\rightarrow \ell\nu)W(\rightarrow 2j)$ : difficult because of MET, but less than above, worth doing it?
- $b\bar{b}\gamma\gamma$ : rates very small, lots of fake photon identification, still promising?
- $b\bar{b}\tau\tau$ : rates small, but quite promising and under consideration by experimental collaborations

see also CMS projections at HL-LHC [CMS Collaboration, arXiv:1307.7135] and ATLAS projections [ATLAS Collaboration, ATL-PHYS-PUB-2012-004, 2013-007, 2013-014]

**Remark:** analyses presented in the following have been performed using the  $gg \rightarrow HH$  production channel,  $HH + 2j$  (using also VBF process) analyses have just started

[Dolan, Englert, Greiner, Spannowsky, Phys.Rev.Lett. 112, 101802 (2014)]

# Triple Higgs coupling sensitivity in the production channels

How sensitive are the three main channels to HHH coupling?

- VBF mode is the most sensitive channel
- Identical shape when increasing the center-of-mass energy but **reduced sensitivity**

[J.B. et al, JHEP 1304 (2013) 151; see also Djouadi, Kilian, Mühlleitner, Zerwas, Eur.Phys.J. C10 (1999) 45-49]

# Triple Higgs coupling sensitivity in the production channels

How sensitive are the three main channels to HHH coupling?

- VBF mode is the most sensitive channel
- Identical shape when increasing the center-of-mass energy but **reduced sensitivity**

[J.B. et al, JHEP 1304 (2013) 151; see also Djouadi, Kilian, Mühlleitner, Zerwas, Eur.Phys.J. C10 (1999) 45-49]

# Triple Higgs coupling sensitivity in the production channels

How sensitive are the three main channels to HHH coupling?

- Identical shape when increasing the center-of-mass energy but **reduced sensitivity**

[J.B. et al, JHEP 1304 (2013) 151; see also Djouadi, Kilian, Mühlleitner, Zerwas, Eur.Phys.J. C10 (1999) 45-49]

**Jet substructure analysis, the major improvement :** fatjet analysis with boosted kinematics to distinguish in jet substructure the signal from large QCD backgrounds

[Butterworth, Davison, Rubin, Salam, Phys.Rev.Lett. 100 (2008) 242001]

the idea: define a large cone size (“fatjet”) and then work backward through the jet to define and separate softer subjects

**Cut strategy:** kinematic acceptance cuts + boosted topology cuts + **Fat jet cuts**

**Results with a SHERPA/MADEVENT+HERWIG++ simulation:**

**$S/B \simeq 0.5$ , 95 signal events for  $1000 \text{ fb}^{-1}$**

- **Adding one jet in the final state ( $hhj \rightarrow b\bar{b}\tau\tau j$ ):** with the same techniques,  $S/B \simeq 1.5$
- **With the addition of kinematic bounding variables: 60% accuracy in trilinear Higgs coupling determination at  $3 \text{ ab}^{-1}$**  [Barr, Dolan, Englert, Spannowsky, Phys.Lett. B728 (2014) 308]
- **With kinematic acceptance cuts + boosted topology cuts only and more optimistic  $M_{\tau\tau}$  window:** [J.B. et al, JHEP 1304 (2013) 151]

**Optimistic expected significance at 14 TeV,  $\mathcal{L} = 3000 (300) \text{ fb}^{-1}$ :**

**$S/\sqrt{B} = 9.37 (2.97)$ , 330 (33) signal events**

**Jet substructure analysis, the major improvement :** fatjet analysis with boosted kinematics to distinguish in jet substructure the signal from large QCD backgrounds

[Butterworth, Davison, Rubin, Salam, Phys.Rev.Lett. 100 (2008) 242001]

**$S/\sqrt{B} = 9.37 (2.97)$ , 330 (33) signal events**

**Parton level analysis:** Pythia 6 using  $gg \rightarrow HH$  matrix elements from HPAIR, rates rescaled to (N)NLO through  $K$ -factors, tag efficiency of 70% ( $b$ ), fake photons with a rough detector simulation (Delphes)

**Cut strategy:** kinematic acceptance cuts + boosted topology cuts

**Rough detector level expected significance at 14 TeV,  $\mathcal{L} = 3000 \text{ fb}^{-1}$ :  
 $S/\sqrt{B} = 6.46$ , 47 signal events**

See also a study at high energy LHC (33 and 100 TeV) in [Yao, arXiv:1308.6302]

# Signal analysis in $b\bar{b}W(\rightarrow \ell\nu)W(\rightarrow jj)$ final state

[Papaefstathiou, Yang, Zurita, Phys.Rev. D87 (2013) 011301]

**Parton level analysis:** MADGRAPH using  $gg \rightarrow HH$  matrix elements from HPAIR, HERWIG++ and ALPGEN for background processes, rates normalized to (N)NLO total cross section

**Cut-based analysis with jet substructure technique, improved with BDT multivariate analysis + specific cuts to this channel, e.g.  $p_{T,H} > 240$  GeV and  $m_{W_h} > 65$  GeV (hadronically decaying W)**

**promising result of  $S/\sqrt{S+B} = 2.4$  with 9 events at  $600 \text{ fb}^{-1}$**

# More improvements

- **Using ratio of cross sections:** similar structure for higher-order corrections in  $\sigma(gg \rightarrow H)$  and  $\sigma(gg \rightarrow HH) \Rightarrow$  **uncertainties on their ratio  $C_{HH}$  much more reduced**  
 $\Delta^\mu C_{HH} \simeq \pm 2\%$ ,  $\Delta^{\text{PDF}} C_{HH} \simeq \pm 2\%$  [Goertz, Papaefstathiou, Yang, Zurita, JHEP 1306 (2013) 016]

Very promising confidence interval of  $\simeq +30\% / -20\%$  on the reduced triple Higgs coupling  $\lambda = \lambda_{HHH} / \lambda_{HHH}^{\text{SM}}$  when the three previous search channels are naively combined

- **Multivariate analysis in  $b\bar{b}\gamma\gamma$ :** improved significance and probe of  $\lambda_{HHH}$  within **40% uncertainty** at LHC 14 TeV with  $3 \text{ ab}^{-1}$  [Barger, Everett, Jackson, Shaughnessy, Phys.Lett. B728 (2014) 433]

- **New from this morning,  $4b$  analysis!** with jet substructure analysis, set a 95% CL limit  $\lambda_{HHH} \leq 1.2$  at  $3 \text{ ab}^{-1}$  [de Lima, Papaefstathiou, Spannowsky, arXiv:1404.7139]

# A (short) selection of BSM studies

**Disclaimer:** there has been a lot of activities in  $HH$  production regarding to BSM theories in the past few years. I apologize here for the missing papers, this is a limited selection

- **Strong sector and anomalous Higgs couplings** [Contino *et al*, JHEP 1005 (2010) 089, JHEP 1208 (2012) 154; Kribs, Martin, Phys.Rev. D86 (2012) 095023]
- **Anomalous  $t\bar{t}$  coupling effects** [Nishiwaki, Niyogi, Shivaji, JHEP 1404 (2014) 011]
- **Two Higgs Doublet Model analyses:** large enhancement possible for non-SM-like triple Higgs couplings [Moretti *et al*, JHEP 0502 (2005) 024; Arhrib *et al*, JHEP 0908 (2009) 035; J.B., Eberhardt, Nierste, Wiebusch, arXiv:1403.1264]
- **MSSM studies:** 1.45 enhancement factor for  $gg \rightarrow H_{\text{SM-like}} H_{\text{SM-like}}$  in the most favored parameter space region, see [Cao, Heng, Shang, Wan, Yang, JHEP 1304 (2013) 134]
- **NMSSM studies:**
  - 0.7 to 2.4 enhancement factor for  $gg \rightarrow H_{\text{SM-like}} H_{\text{SM-like}}$  in the most favored parameter space region [Cao, Heng, Shang, Wan, Yang, JHEP 1304 (2013) 134]
  - sizeable enhancement in  $\sigma \times BR$  predictions in  $gg \rightarrow h_i h_j \rightarrow b\bar{b}\tau\tau, b\bar{b}\gamma\gamma$  for 1 SM-like Higgs boson and a lighter Higgs state [Ellwanger, JHEP 1308 (2013) 077]
  - One-loop corrections to trilinear Higgs couplings in the real NMSSM [Nhung, Mülleleitner, Streicher, Walz, JHEP 1311 (2013) 181]
- **Resonant new physics in  $HH$  production:**
  - generic new physics [Dolan, Englert, Spannowsky, Phys.Rev. D87 (2013) 5, 055002]
  - new Higgs states analysis [Liu, Wang, Zhu, arXiv:1310.3634; Arhrib, Ferreira, Rui Santos, JHEP 1403 (2014) 053; J.B., Eberhardt, Nierste, Wiebusch, arXiv:1403.1264]
  - jet substructure technique, case study of massive KK graviton [Gouzevitch *et al*, JHEP 1307 (2013) 148]
- **SM + 2 singlets:** large enhancement in  $gg \rightarrow H_{\text{SM}} H_{\text{SM}}$  [Ahriche, Arhrib, Nasri, JHEP 1402 (2014) 042]
- **Exotics:** pair production with color-octet scalars [Heng, Shang, Zhang, Zhu, JHEP 1402 (2014) 083], Minimal Dilaton Model [Cao, He, Wu, Zhang, Zhu, JHEP 1401 (2014) 150], etc.

## Trilinear Higgs coupling at the LHC:

- **Major news from 2012: the observation of a scalar particle at the LHC compatible with the SM Higgs boson**
- Higgs couplings measurements era has began:  
**HHH coupling of utmost importance for the scalar potential measurement**
- **HH production channels status: 2013 has seen major improvements in the QCD corrections**
  - VBF process now at NLO (total rates and differential distributions) and NNLO in the approximation of the structure function, Higgs-strahlung at NNLO (total rates)  
⇒ **total theoretical uncertainty < 10% in VHH and VBF channels**
  - **Gluon fusion channel at NNLO+NNLL in the infinite top mass limit for the total rate, top mass expansion at NLO**  
⇒ **scale uncertainty reduced to  $\pm 8\%$  at 14 TeV**
- **HH Parton level analysis: jet substructure technique is the 2013 major improvement**  
 **$b\bar{b}\tau\tau$  channel really promising even already at  $\mathcal{L} = 300 \text{ fb}^{-1}$**   
 **$b\bar{b}\gamma\gamma$  may also be very interesting at  $\mathcal{L} = 3000 \text{ fb}^{-1}$**   
 **$b\bar{b}W(\rightarrow \ell\nu)W(\rightarrow 2f)$  shows good prospects with multivariate analysis at  $600 \text{ fb}^{-1}$**
- **Stay tuned, more to come with improvements towards a full NLO calculation for  $gg \rightarrow HH$  including the differential distributions!**

# Thank you!

## ■ Signal analysis in $b\bar{b}\tau\tau$ :

Main backgrounds considered:

- ▶ continuum production:  $pp \rightarrow b\bar{b}\tau\tau$ ;  $b\tau^+\nu_\tau \bar{b}\tau^-\bar{\nu}_\tau$  (mainly from  $t\bar{t}$  production)
- ▶  $ZH \rightarrow b\bar{b}\tau\tau$  production

Define the subjet separation in the fat jet: using mass-drop condition,

$$m_{j_1} \leq 0.66m_j \text{ \& \; } \min(p_{T,j_1}^2, p_{T,j_2}^2)/m_j^2 \Delta R_{j_1,j_2}^2 > 0.09$$

$\tau$  reconstruction efficiency of 80%

## ■ Signal analysis in $b\bar{b}\gamma\gamma$ :

Main backgrounds considered:

- ▶ continuum production:  $pp \rightarrow b\bar{b}\gamma\gamma$
- ▶  $t\bar{t}H$  production with  $H \rightarrow \gamma\gamma$  and  $t \rightarrow W^+b$  decays,  $ZH \rightarrow b\bar{b}\gamma\gamma$  production

## ■ Signal analysis in $b\bar{b}W(\rightarrow \ell\nu)W(\rightarrow jj)$ :

Main backgrounds considered:

- ▶ largest background:  $pp \rightarrow t\bar{t}$  with semi-leptonic decays
- ▶  $W(\rightarrow \ell\nu)b\bar{b} + 2j$  production,  $H(\rightarrow WW)b\bar{b}$  production and  $H + jj$  with misidentified jets
