Measurement of charged particle multiplicities and densities in pp collisions at 7 TeV in the forward region

Tuesday 29 April 2014 15:20 (20 minutes)

Charged particle multiplicities are studied in proton-proton collisions in the forward region at a centre-of-mass energy of $\sqrt{s} = 7$ TeV with data collected in 2010 by the LHCb experiment. The forward spectrometer allows access to a kinematic range of $2.0 < \eta < 4.8$ in pseudorapidity, momenta down to 2 GeV/c and transverse momenta down to 0.2 GeV/c. The results are presented as functions of pseudorapidity and transverse momentum and are compared to predictions from several Monte Carlo event generators.
