

WLCG Monitoring Consolidation meeting

Julia Andreeva
IT/SDC

5 July 2013

Introduction

- The goal of the project is the consolidation of the WLCG monitoring, including critical analysis of what is monitored, the technology used and the deployment and support model.
- The first step of the project is review of the current monitoring systems in terms of functionality, scalability and performance on one hand and in terms of design and technical implementation on the other hand
- Today meeting is dedicated to the review (customers) of functionality which is currently provided (in conjunction with corresponding tools) and collecting requests for missing functionality (if any)
- Experiments and WLCG operations team kindly agreed to make a global assessment of functionality of the monitoring systems, according to the list compiled on the twiki page
<https://twiki.cern.ch/twiki/bin/view/LCG/InitialStatus>
- We rely on the assumption that assessment of sites is performed via assessment of the WLCG Operations team and partially via assessment of the experiments.
