

# Workshop Summary: An Experimental Perspective

The poster features a background image of a particle detector's inner layers, showing a complex grid of blue and white light patterns. In the top right corner, there is a circular graphic with a globe and several colored lines (green, orange, blue) representing particle tracks or jets.

**BOSTON JET PHYSICS WORKSHOP**

January 21-23, 2014  
Stata Center, MIT

This workshop will focus on maximizing the potential of newer, more sophisticated treatments of jets in collider physics that have emerged over the past several years. Of particular interest will be bringing physicists of various communities together to understand what experimental and theoretical uncertainties need to be brought under control and what under-explored opportunities are present for jet physics.

**ORGANIZERS**

**Harvard:**  
Marat Freytsis  
David Lopez Mateos  
Matthew Schwartz

**MIT:**  
Andrew Larkoski  
Duff Neil  
Jesse Thaler

**David López Mateos, Harvard University**  
2<sup>nd</sup> Boston Jet Workshop, January 23<sup>rd</sup>, 2014

# Workshop Goals

- ▶ Encourage discussions across experimental communities and between theory/experiment
- ▶ Through those discussions advance more quickly towards a better understanding of jet physics and its potential at the LHC
- ▶ Some overlap with BOOST, but note: a lot of jet physics at the LHC is not boosted

Jets vs. Subjets vs. Particles

Issues in Soft QCD

Hammers and Nails

Precision Jet Physics

The Elegance of Jets

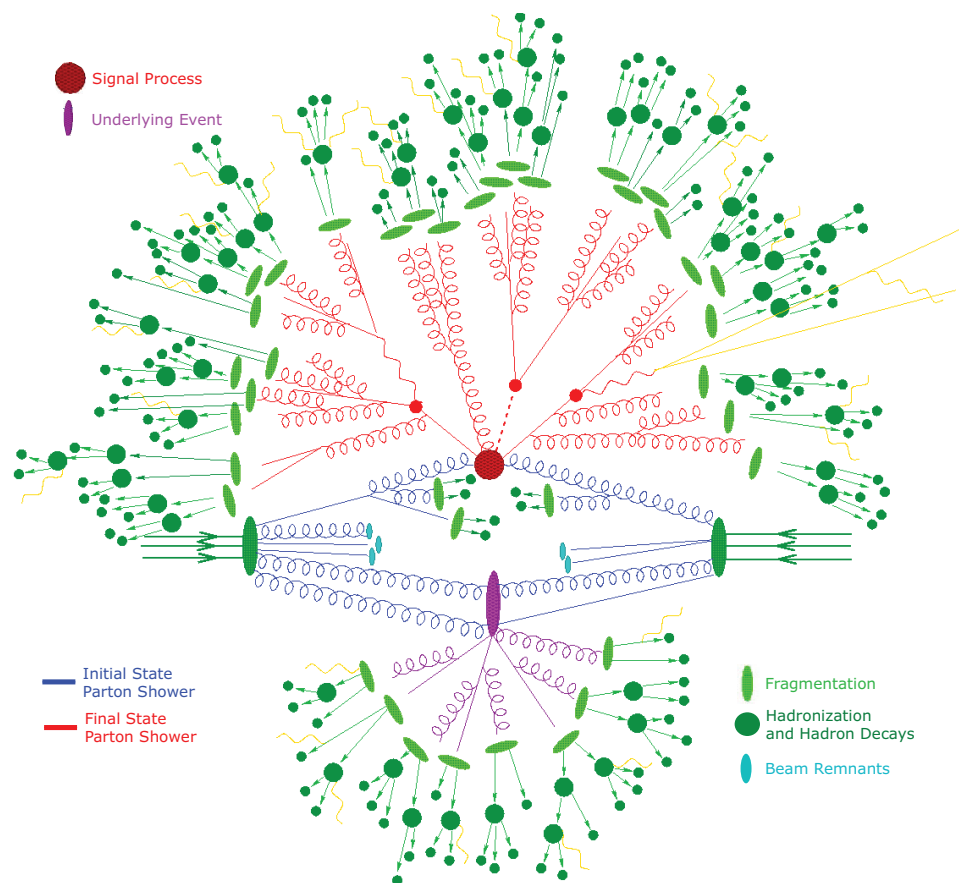

Assessing Standard Candles

Pile-Up Mitigation and Validation

Jet from Heavy Ions

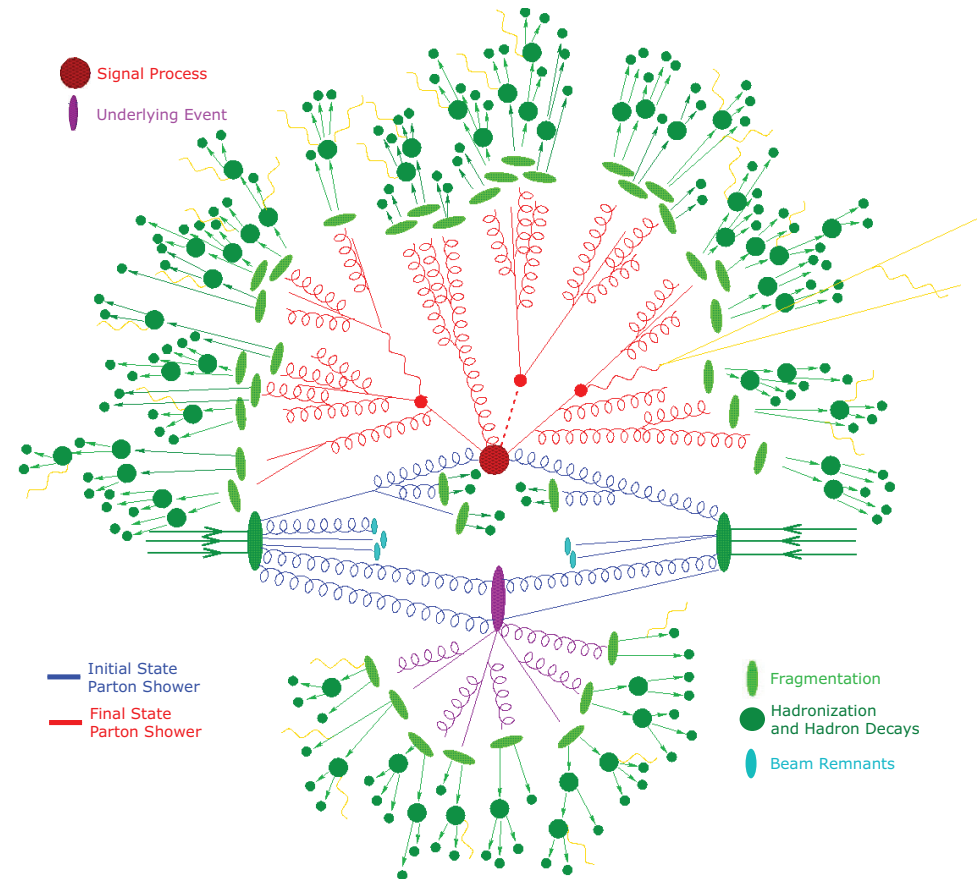

# Workshop Goals

- ▶ Encourage discussions across experimental communities and between theory/experiment
  
- ▶ Through those discussions advance more quickly towards a better understanding of jet physics and its potential at the LHC
  
- ▶ Some overlap with BOOST, but note: a lot of jet physics at the LHC is not boosted

# Workshop Goals

- ▶ Encourage discussions across experimental communities and between theory/experiment
  
- ▶ Through those discussions advance more quickly towards a better understanding of jet physics and its potential at the LHC
  
- ▶ Some overlap with BOOST, but note: a lot of jet physics at the LHC is not boosted
  
- ⇒ BOOST without prejudice (and with a bit more discussion)

## Day 1

- ▶ Soft QCD and pile-up
- ▶ Jets vs subjects vs particles

## Day 2

- ▶ Jets in heavy ion collisions
- ▶ Jet substructure (for searches)

## Day 3

- ▶ Precision QCD
- ▶ Jet searches (with and w/o substructure)

# Color connections

Issues in Soft QCD

(\*) P. Skands

► Can collective effects help improve the description of underlying event observables?

⇒ Some of these effects impact pile-up simulation: understanding of pile-up effects

# Gluon Splitting

Issues in Soft QCD

Less singular than gluon emission: single log

$$P(g \rightarrow q\bar{q}) \propto \frac{1}{m_{q\bar{q}}^2}$$

→ Less precise, from parton-shower viewpoint

Massive quarks → not even singular

Predictions for  $g \rightarrow cc, bb$  differ greatly between models

(\*) P. Skands

▶ We don't think of gluon splitting to heavy flavors as part of the tune, but right now it is, and not very well constrained

▶ Quite important for certain substructure analyses

⇒ Can we provide measurements to help this tuning?

## Issues in Soft QCD

▶ Reminder: tune affects low- $x$  behavior and parton shower evolution

⇒ Certain observables are more sensitive to the tune than expected

⇒ NLO+PS MCs can be quite sensitive to the tunes

$\int L dt = 37 \text{ pb}^{-1}$   
 $\sqrt{s} = 7 \text{ TeV}$   
 anti- $k_t$  jets,  $R = 0.4$

- Data with statistical error
- Systematic uncertainties
- ▨ NLOJET++ (CT10,  $\mu = p_T^{\text{max}}$ ) × Non-pert. corr.
- ▲ POWHEG (CT10,  $\mu = p_T^{\text{beam}}$ ) ⊗ PYTHIA AUET2B
- POWHEG (CT10,  $\mu = p_T^{\text{beam}}$ ) ⊗ PYTHIA Perugia2011
- ▼ POWHEG (CT10,  $\mu = p_T^{\text{beam}}$ ) ⊗ HERWIG AUET2
- POWHEG fixed order (CT10,  $\mu = p_T^{\text{beam}}$ ) × Non-pert. corr.

(\*) N. van Remortel

# Underlying Event through Factorization?

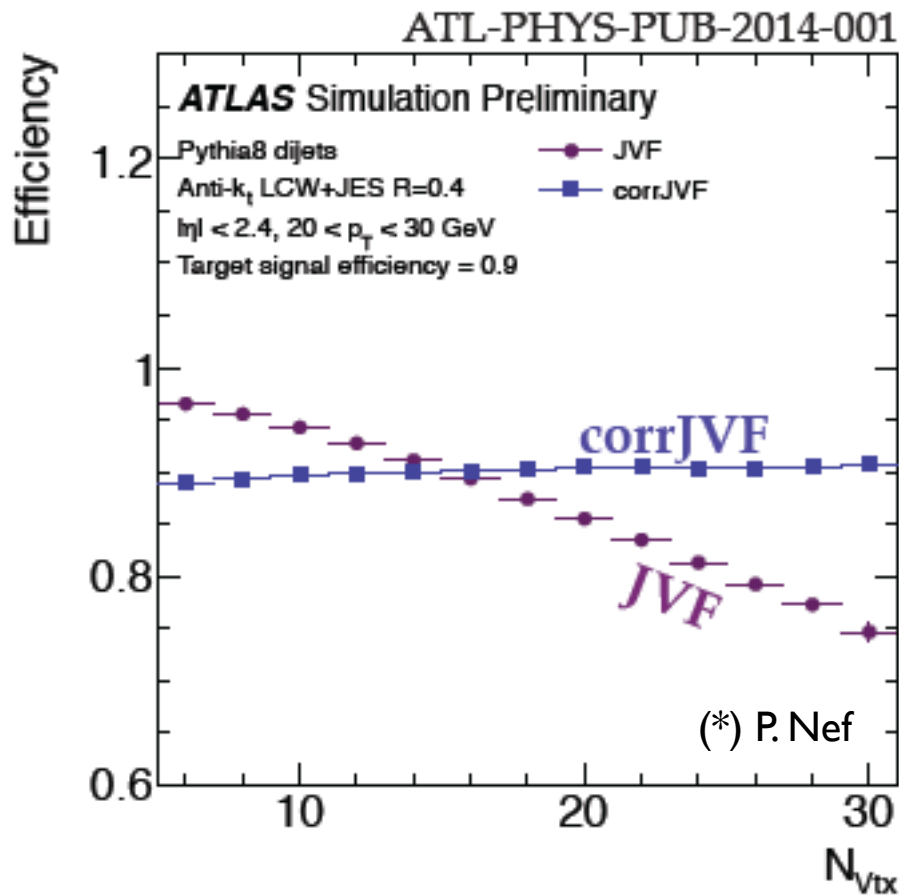

Issues in Soft QCD

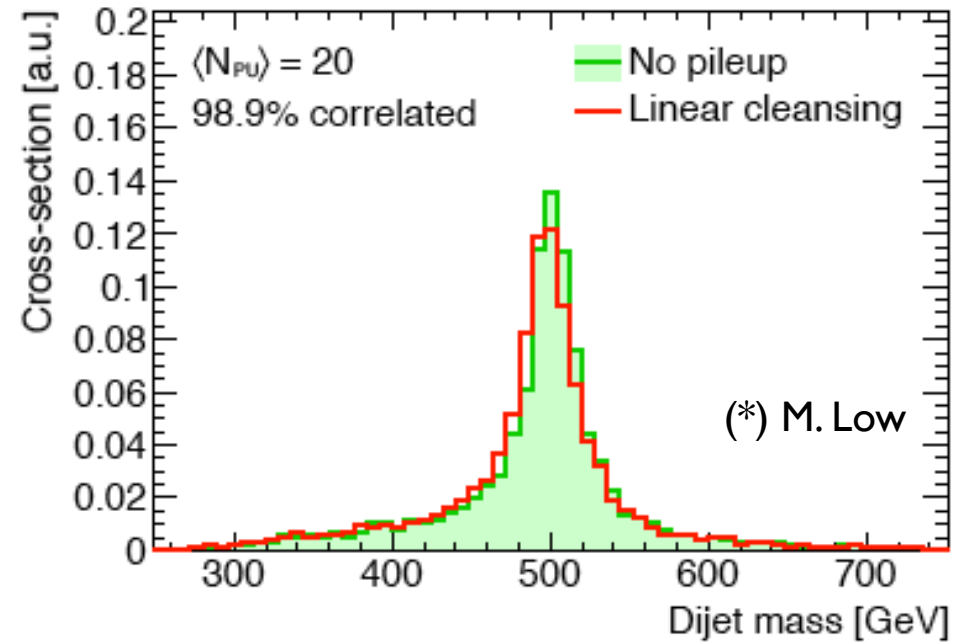

(\*) W.Waalewijn

- ▶ The underlying event might be described through factorization
- ⇒ How different are these predictions to what Pythia provides?
- ⇒ Are we sensitive to those differences?

# Updates on Pile-up

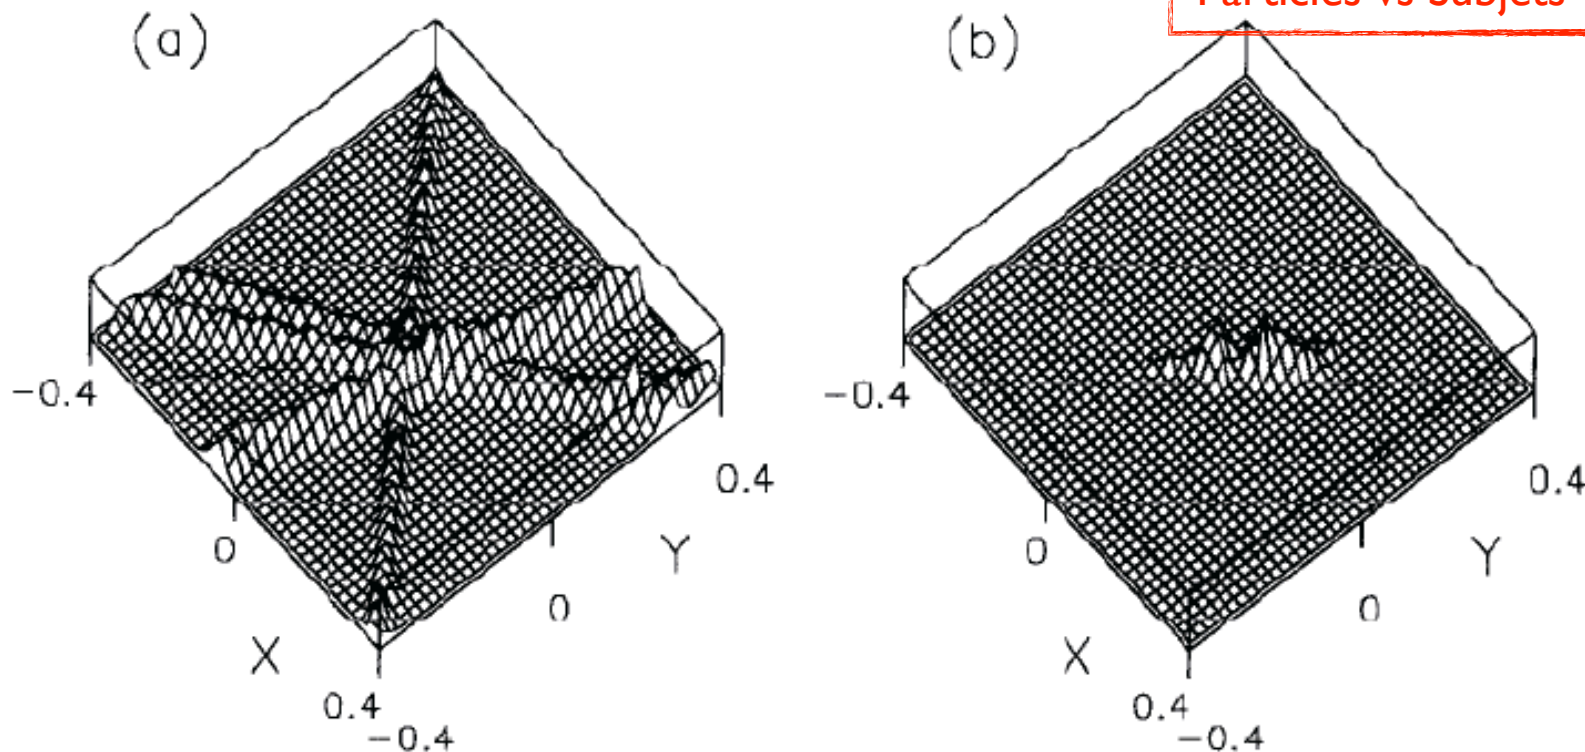

## Pile-up Mitigation

- ▶ Standard pile-up mitigation depends on amount of pile-up: found fixes for that
- ▶ Cleansing already reported at BOOST: first results from ATLAS showing feedback on that

# Vertex Substructure?

Particles vs Subjects vs Jets

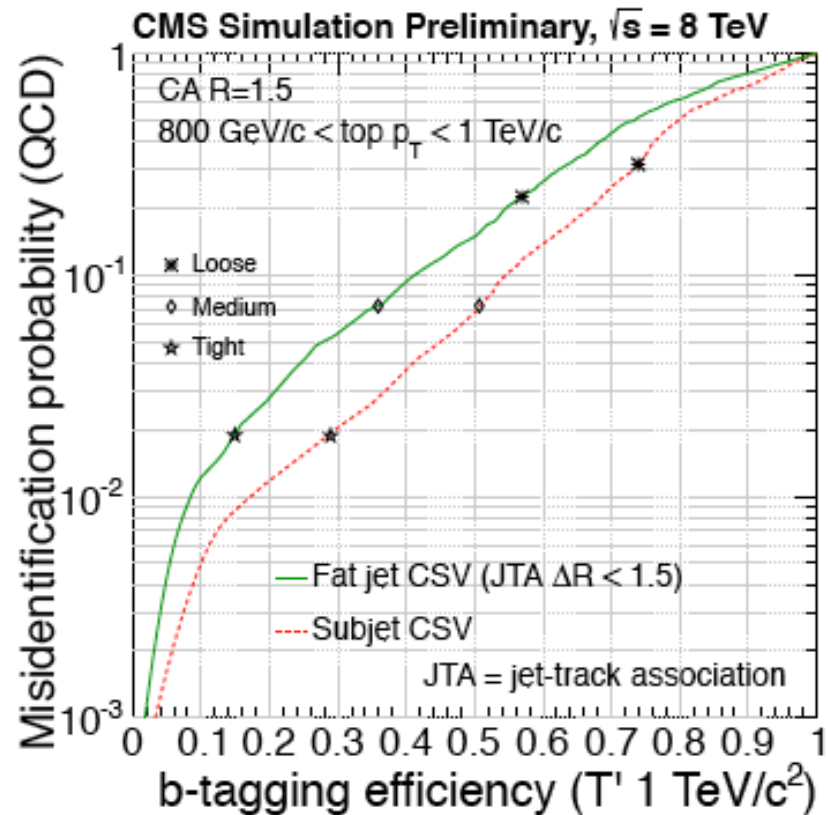

(\*) A. Schwartzman

► Nice review of at what level experiments use jets, subjects, particles

⇒ Experiments should be able to be more precise about angular scales for different types of particles

# Subjet b-tagging

(\*) J. Dolen

► Being developed in ATLAS, already calibrated in CMS: subjet b-tagging

⇒ Clearly lots of potential, I hope we can discuss more details in the future

# To Jet or Not To Jet

Hammers and Nails

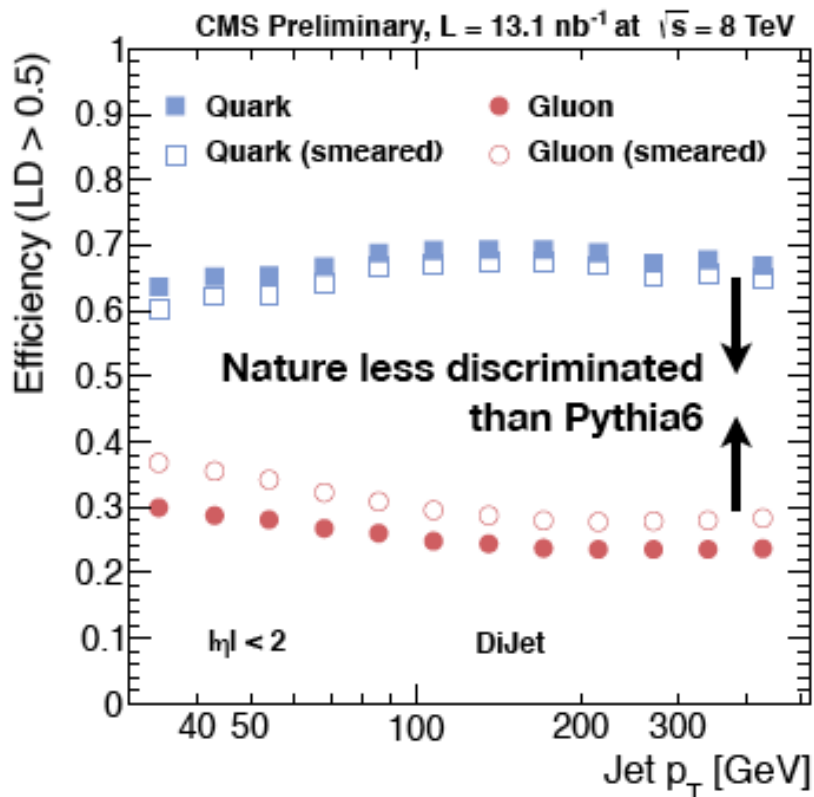

(\*) D. Bertolini

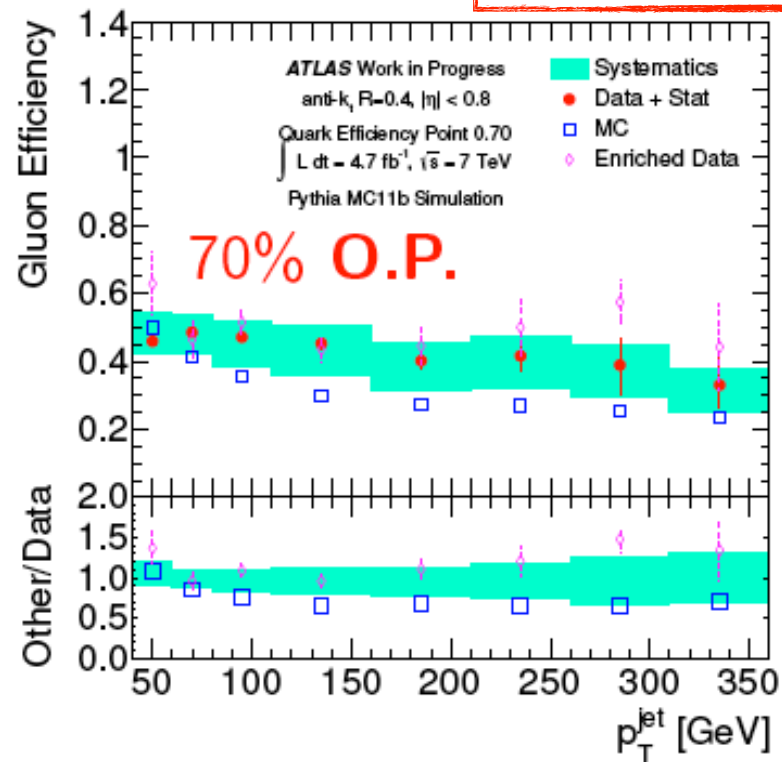

- ▶ Reconstruction of jet axes might be fast/IR safe alternative to full recombination
- ⇒ Already thinking of doing this in the trigger, but need to understand correlations with anti- $k_T$  algorithms

# Quark/Gluon Tagging

Several topics

(\*) F. Pandolfi

(\*) M. Swiatlowski

► Quite different analyses in ATLAS and CMS, but we both agree: gluons look wrong

⇒ Can the theory community use some of the available measurements to understand these, do we need new ones?

## Jets in Heavy Ions

1. Background energy per tower calculated in strips of  $\eta$ . Determine  $\langle p_T \rangle$  and  $\sigma(p_T)$   
Subtract  $\langle p_T \rangle + N \cdot \sigma(p_T)$  (Noise suppression)
2. Run anti  $k_T$  algorithm on background subtracted towers

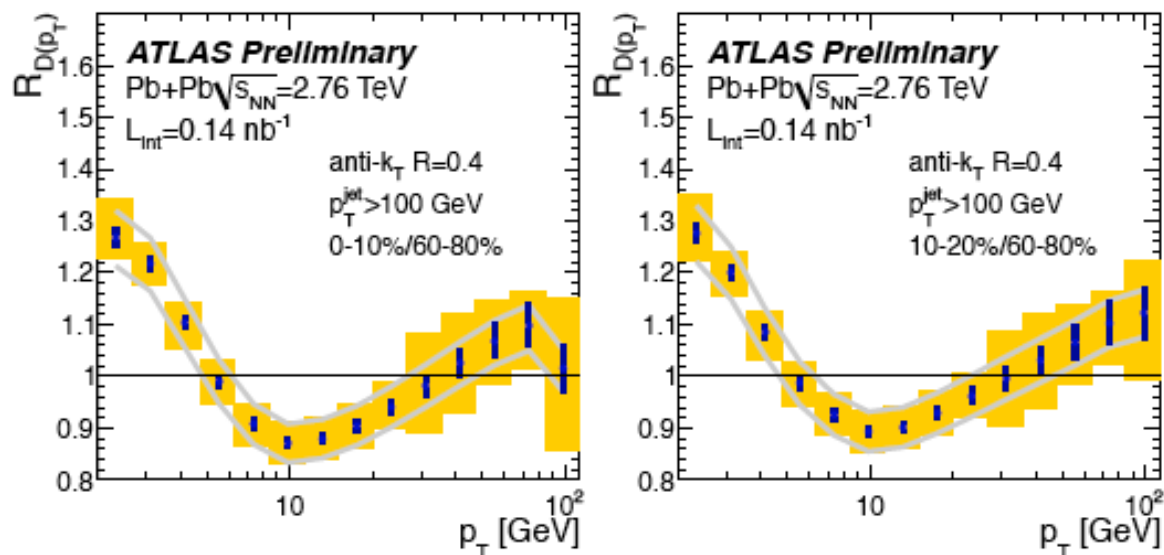

(\*) Y.-J. Lee

► We heard a lot of detail about the heavy ion calibration, I learnt quite a few things

⇒ Do we fully understand the interplay between p-p and Pb-Pb calibrations, can we improve?

# Looking inside jets in Heavy Ions

## Jets in Heavy Ions

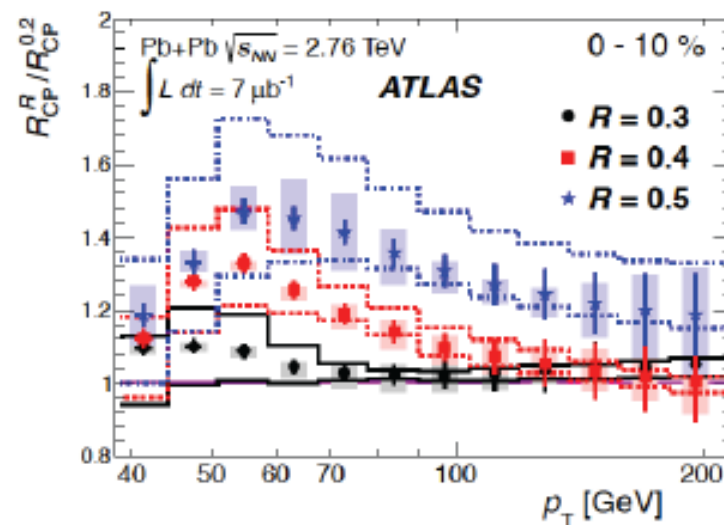

(\*) B. Cole

► Heavy ion community starting to look at differences inside jets

⇒ Can some of the variables that we use in the p-p community help tell the difference between different quenching models?

- Can easily wipe out the Radius dependence of jet observables (also for di-jets)

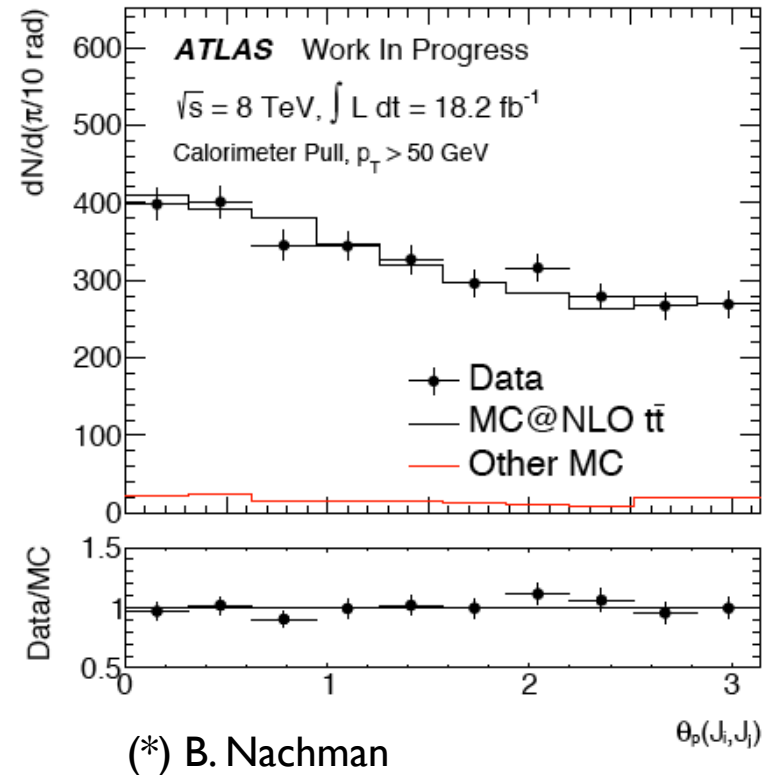

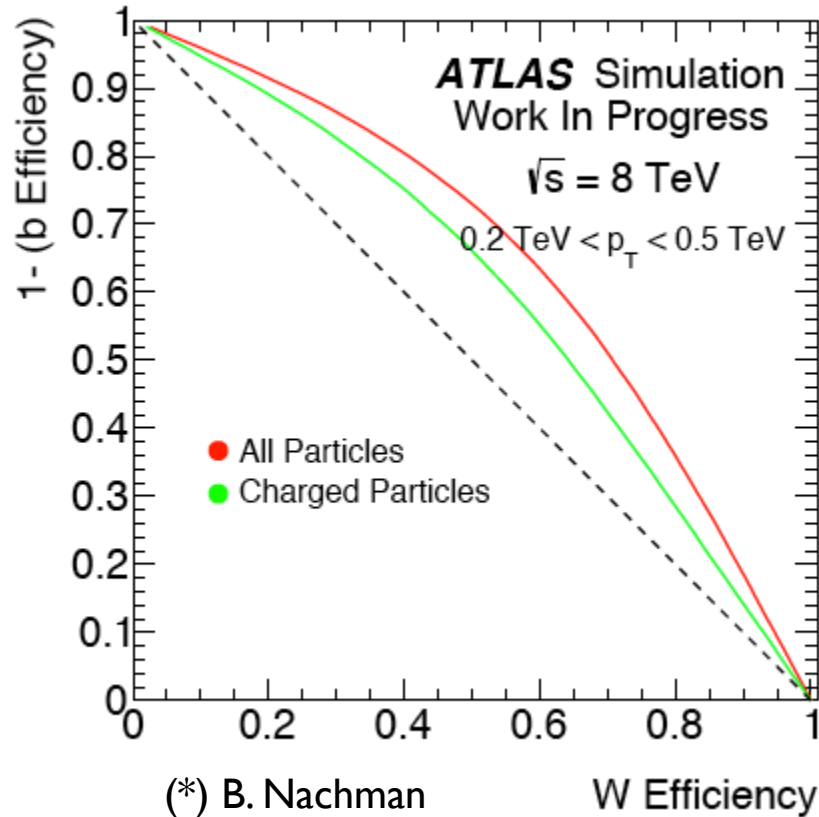

The medium induced parton shower is not fully dissipated in the medium

(\*) I.Vitev

# The Elegance of Jets

And Hammer and Nails

- ▶ Pull is a sensitive variable for tagging, but also probe the color structure of events
- ⇒ Other final states where we can probe color structure/reconnections?

# Workshop cross polination

Precision QCD

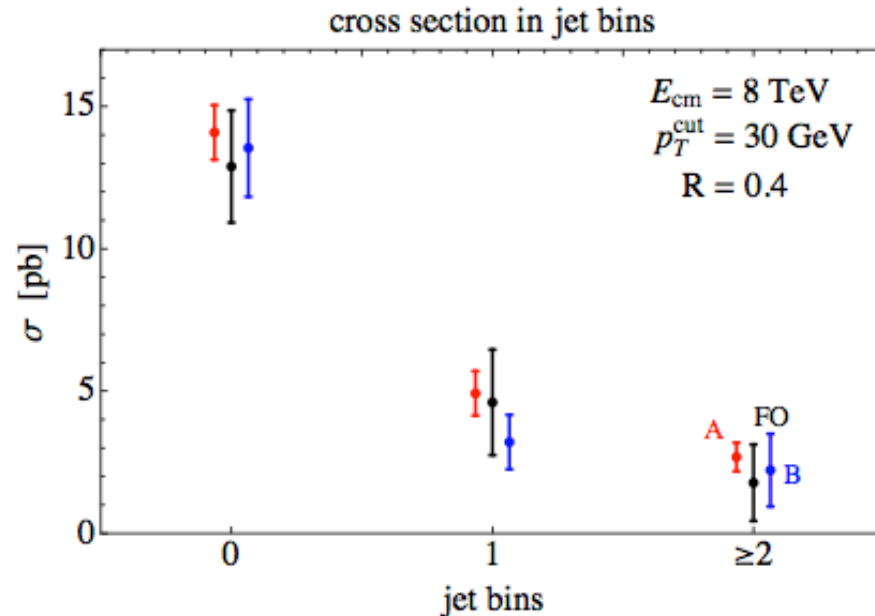

(\*) C. Lee

- ▶ dQCD vs SCET, different language, but can be put in a common framework: motivated by a similar workshop to this one, 4 years ago

# Theory Errors for Higgs

## Precision QCD

bin-by-bin uncertainties reduced by a factor of 2 over FO

cross section in the WW analysis

$$\sigma_{WW} = \epsilon_0^{\text{acc}} \sigma_0 + \epsilon_1^{\text{acc}} \sigma_1 + \epsilon_{\geq 2}^{\text{acc}} \sigma_{\geq 2}$$

acceptances from analysis cuts  
(jet bin cuts, leptonic cuts, reconstruction efficiencies)

need to determine the theoretical uncertainty on this cross section

(\*) J. Walsh

► Jet-bin to jet-bin theory correlations

⇒ May be key to reduce theoretical systematic uncertainties in Higgs measurements

# Closing Comments

- ▶ I had a lot of fun discussing with all of you, I hope you did too
- ▶ I had a lot of new ideas of helpful/interesting things to do
- ▶ Some people have started putting together wish-lists for their favorite theoretical observables (please circulate)
- ▶ Thanks to all of you for your great contributions/comments and lively discussions
- ▶ And thanks to my co-organizers for their great work in spite of the weather
- ▶ Let the discussion continue...

**BACK-UP SLIDES**

# Wish List

- ▶  $g \rightarrow bb$  ( $cc$ )  $\times q\bar{q} = m_{q\bar{q}}^2/p_T g^2$ ,  $z = E_b/(E_b + E_{\bar{b}})$ ,  $P(z) = z^2 + (1-z)^2$ ,  $\phi^*$
- ▶ Quark/gluon tagging: particle multiplicities
- ▶ Charged/neutral ratio (energy or  $p_T$ )
- ▶ Lumpiness/structure of transverse (UE) region (or just N-jettiness, collinear structure)
