

# A Search for a Neutral, Massive Boson

Aaron Vermeersch

Michigan State University

Local Mentor: Dr. Daniel Hayden

# Signals and Backgrounds

- Signal
  - Electron Channel
- Irreducible Background
  - Drell Yan process
- Reducible Background
  - Diboson,  $t\bar{t}$ ,  $W$ +Jets, QCD

# AFB and the Collins-Soper Frame

- Collins-Soper Frame:
  - $\theta_{CS}^*$  is the angle between the incoming quark and the outgoing electron in the dielectron rest frame with the z axis orientated such that it bisects the angle between the quark direction of motion and opposite to the anti-quark direction.
  - Used to minimize uncertainty in the momentum direction of the initial quark/anti-quark.

- Forward and Backward defined as:
  - Where  $Q$  = Dielectron four momentum
  - $P_1$  ( $P_2$ ) = four momentum of electron (positron)
  - If greater than 0 then event is forward.  
If less than 0 then it is backwards.

$$\cos \theta_{CS}^* = \frac{Q_z}{|Q_z|} \frac{2(P_1^+ P_2^- - P_1^- P_2^+)}{|Q| \sqrt{Q^2 + Q_T^2}}$$

$$P_i^\pm = (P_i^0 \pm P_i^3) / \sqrt{2}.$$

- Forward Backward Asymmetry calculated by:

$$A_{FB} = \frac{\sigma_F - \sigma_B}{\sigma_F + \sigma_B}$$

Forward Backward Asymmetry with Linear Binning

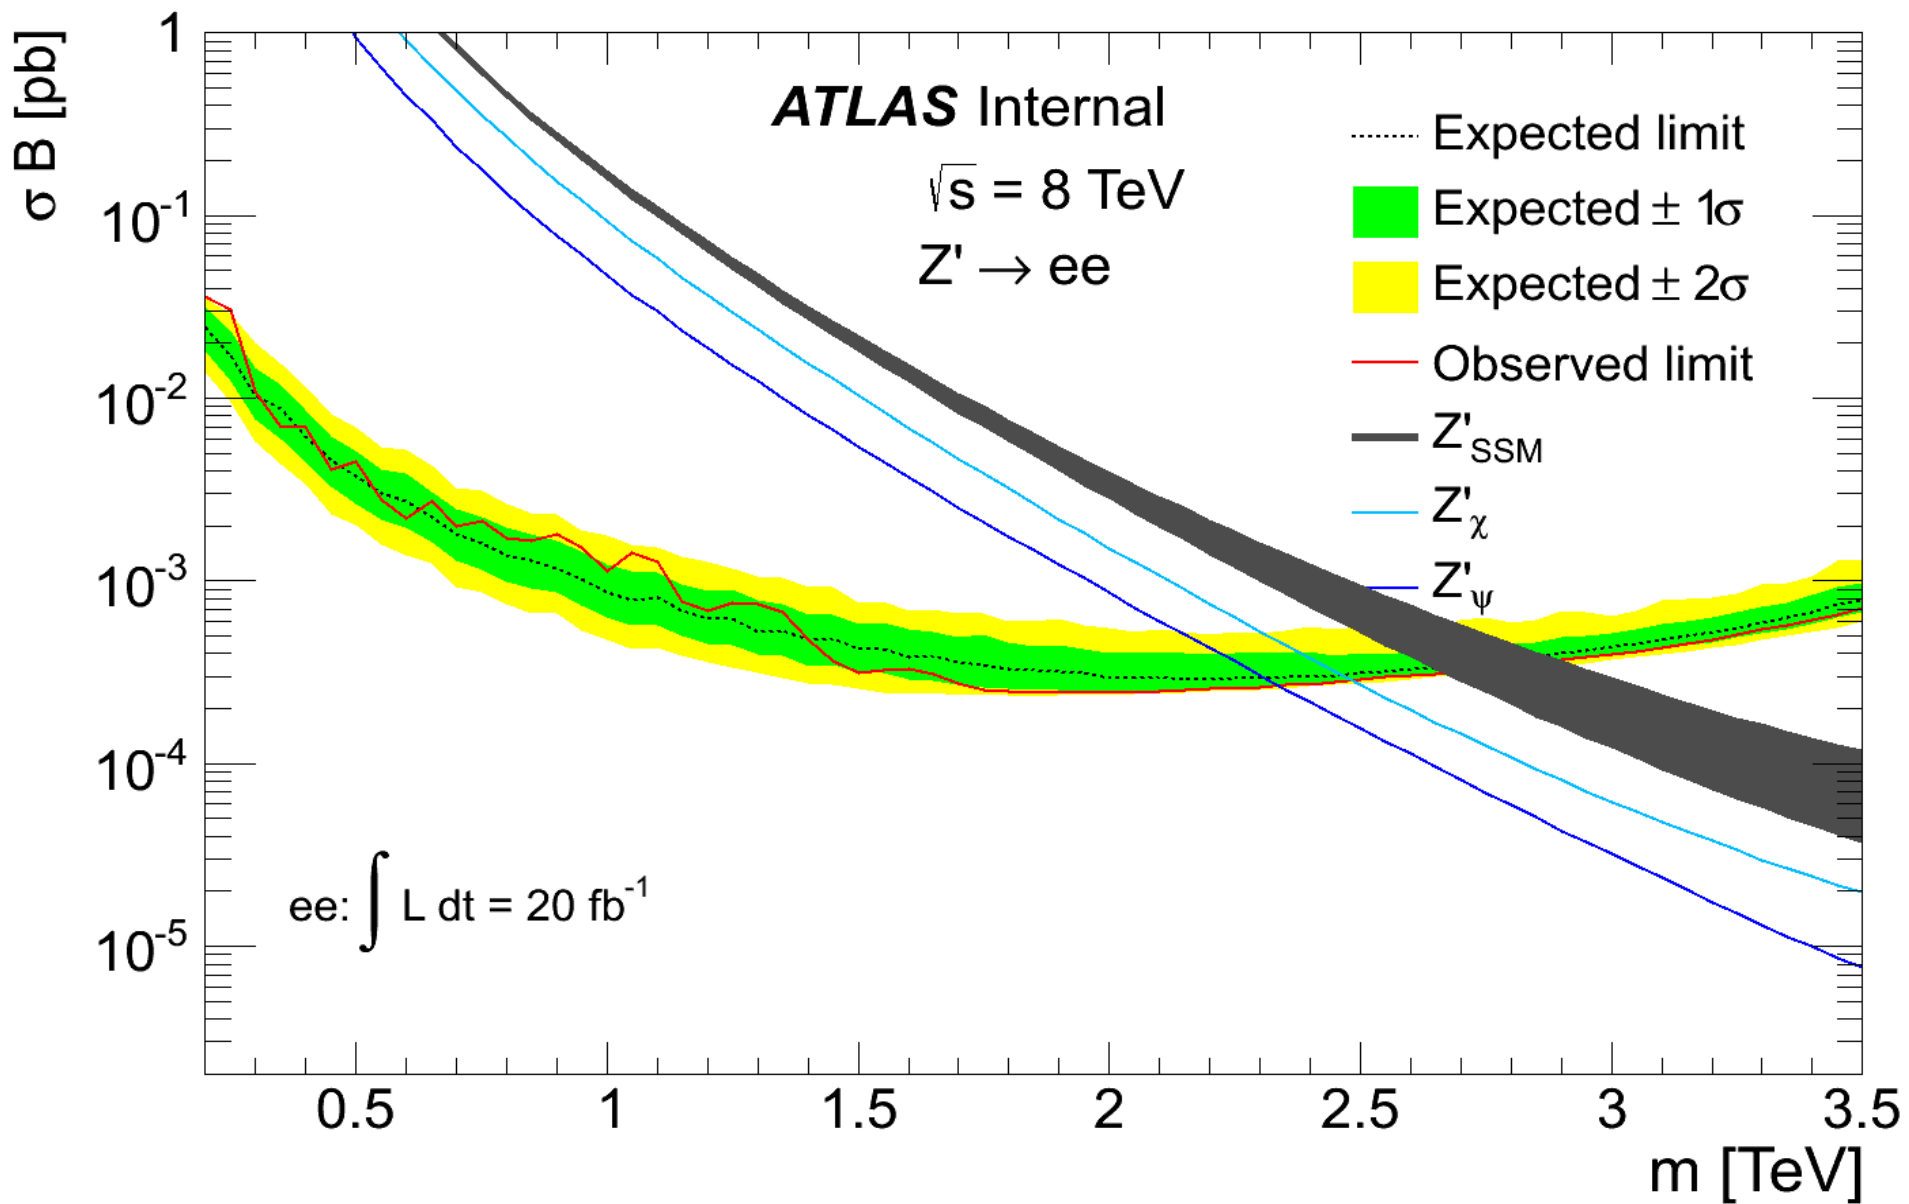

- Standard Model Drell Yan
- $\sqrt{s} = 8 \text{ TeV}$

Forward Backward Asymmetry

- $E_6$  Psi Model
- $m_{Z'} = 1.5 \text{ TeV}$
- Pythia E6
  - Dedicated generation of  $E_6$  model
- Weighted SM
  - Ratio of cross sections between the  $E_6$  model and the SM

# Summary

- Continuing work on re-weighting algorithm
  - Comparing multiple kinematic variables from samples with ISR/FSR .
- Analysis for official ATLAS D3PD's is finished
  - Includes 2013 event selection, latest MC corrections, and necessary calculations.
- Bayesian Analysis Toolkit setup to run on the Tier3
  - Needs to be modified for 2D search.

# Additional Material

# Model Re-Weighting

- To search for possible signal scenarios I will need to generate separate samples for each point in parameter space
  - Problems: Computationally Intensive and Time Consuming
- Solution: Model Re-Weighting
  - Take Standard Model Drell Yan events and apply weight to create BSM distributions
  - Given four-momentums of the initial quarks and final state electrons, the code will calculate the couplings for the relevant model (SM, SSM, E6) and determine the cross section
  - Weight that is applied is then the ratio of the cross section between BSM and SM

# Validation

Forward Backward Asymmetry

- Three  $Z'$  masses: 1.5 TeV, 2.25 TeV, 3 TeV
- Four  $E_6$  models: Psi, Chi, Eta,  $\theta=3\pi/4$
- Compared AFB and mass plots at each point
- Propagated Uncertainties for  $A_{FB}$
- Distributions shown here:  $E_6^{\text{Psi}} Z'$  at 3 TeV

Mass of  $e^-e^+$  Pairs in  $E_6$
