User Experiences

Tuesday, 15 April 2014 16:40 (1 hour)

In this presentation we take a look at user experiences, how users interact with our software, how we can help simplify interfaces, procedures and experiences for users. As software engineers we are trained to program for corner cases and exceptions. In fact software engineers depend on this ability for testing software. However this can lead us to developing overly complex software, or software which tries to cover too many exceptions. Here we look at some of these cases and how we can help simplify the user experience we present to our users.
