- Sequence of LHC Operational states:

- **2012 Observations** (average values):
 - Turnaround: 5.5 h
 - Fault time per fill: 4.8 h
 - Stable Beams: 6.1 h
- **Monte Carlo model** for performance evaluation (MATLAB):
 - Generation of random numbers based on 2012 distributions
- The model reproduces a **realistic timeline** of 1 year of LHC OP:
 - Assumes 2012 parameters as reference
 - Includes intensity Ramp-up
 - Allows for sensitivity analyses to relevant parameters

Availability Model: Timeline

- **Fault Time** distributions → from eLogbook
- **Turnaround Time** → only average value can be deduced from eLogbook and PM
- **Stable Beams Time** distributions → from PM
- **Peak Luminosity** distributions → from TIMBER (exponential fit)
- **Luminosity Lifetime** distributions → from TIMBER
- **Machine Failure Rate**: # fills with failures/ total # physics fills
→ deduced from PM

Fault time distributions in 2012

4 lognormal distributions were adopted to model the failures in 2012:

“Shaping” these distributions allows making predictions for possible future operational scenarios

Model Validation: 2012 Operation

The model was validated for 2012 operation (verifying Integrated Lumi, SB time, Fault Time, Turnaround time, number of fills,...):

AVG SIMULATED:

- 23.00 [fb⁻¹]

2012 MEASURED:

- 23.27 [fb⁻¹]

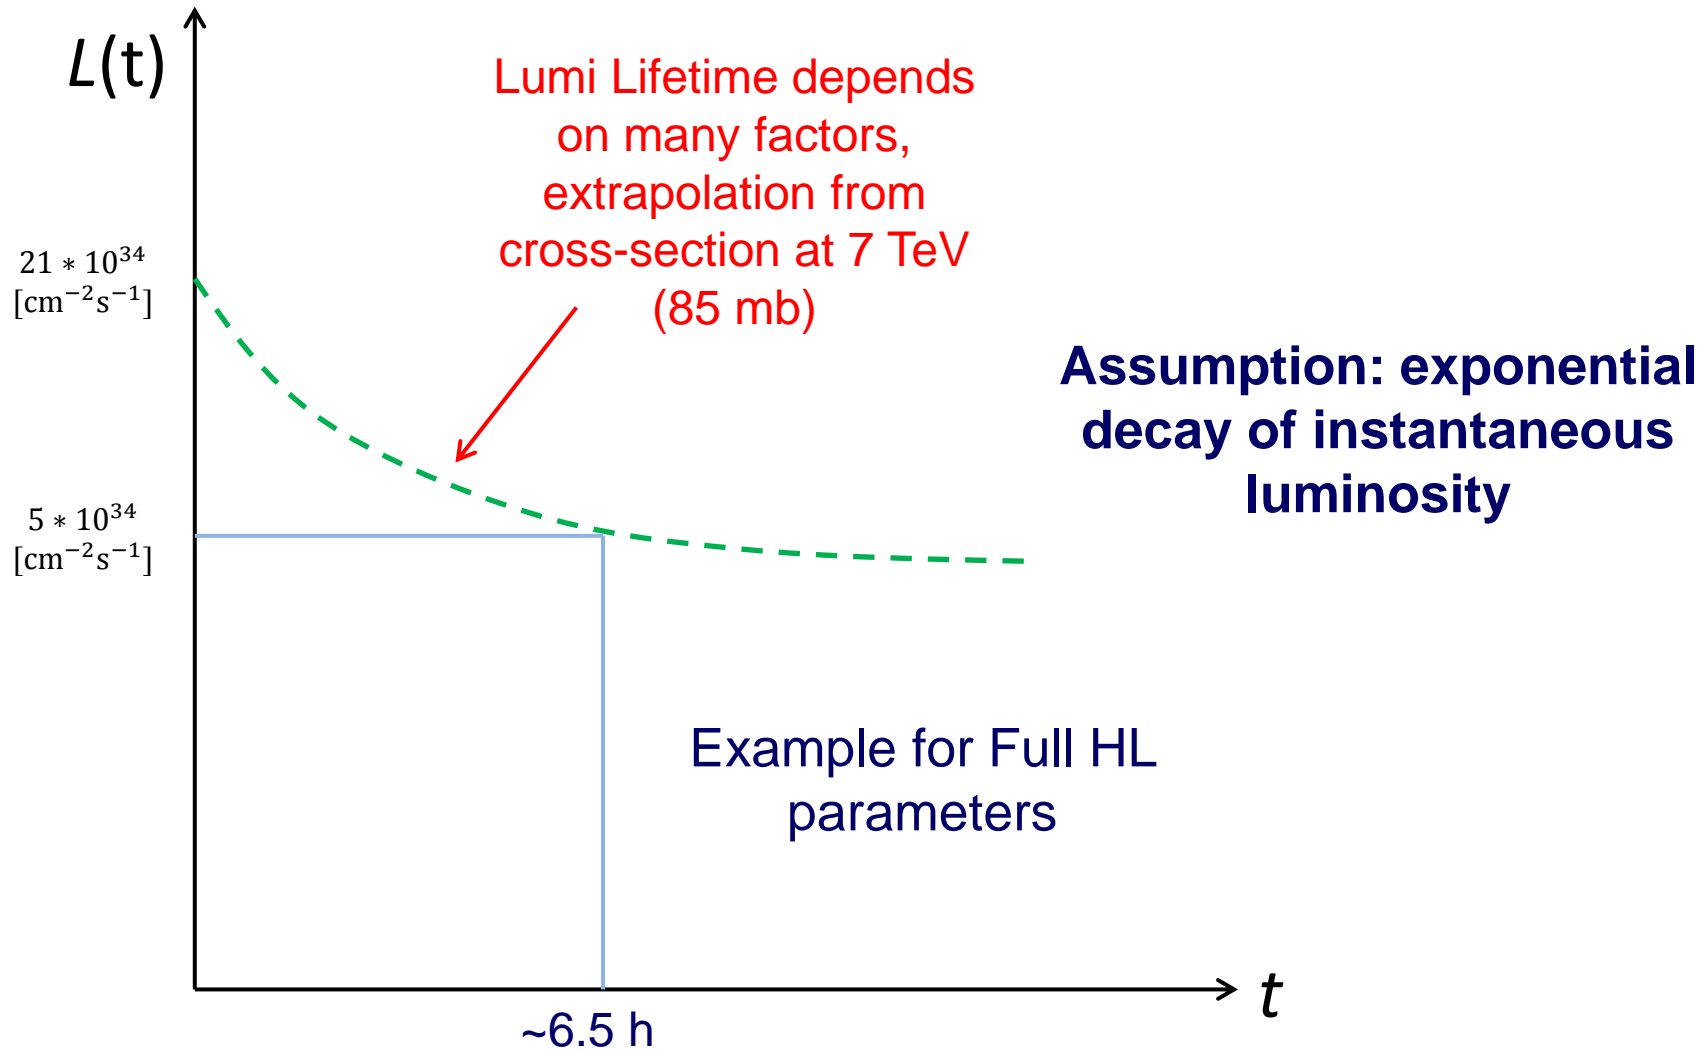

REL ERROR:

- 1.14%

Simulated years of operation: 1000, ~1.5 min Simulation Time

Model Extension: Levelling

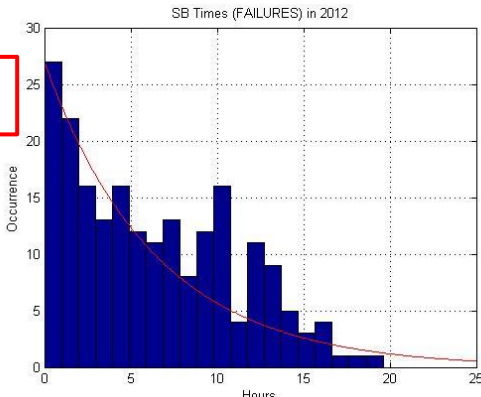

The model was then extended to include levelling:

Model Extension: Levelling

~ 6.2 h

- Monte Carlo model for Availability predictions
- **Predictions for Post-LS1 Operation**
- Predictions for HL-LHC
- Potential of Petri-Nets for Availability predictions
- Conclusions

- **160 days of operation**
- **25 ns operation** with and without Linac4 (BCMS and Standard + Linac4)
- **4.5 h average luminosity lifetime** (~10 h in 2012)
- **6.2 h average turnaround time** (5.5 h in 2012)
- **4 logn distributions for the fault time** + future scenarios
- **2 stable beams time distributions:**
 - END OF FILL: gauss(mean 9.6 h)
 - EMERGENCY DUMPS: exp(mean 4.6 h)

Possible future scenarios:

- 1. Extension of 2012 fault distributions to Post-LS1 operation**
- 2. Impact of UFOs at 6.5/7 TeV**
- 3. Impact of increased BLM thresholds and Beam-Induced Quenches (BIQ)**
- 4. Impact of LS1 mitigations wrt SEUs**
- 5. Possible impact of increased energy on SEUs**
- 6. Combination of 3 and 4: Impact of increased BLM thresholds and Beam-Induced Quenches (BIQ)+ SEUs mitigations**

Post LS1 LHC Operation

Beam	β^* (m)	Leveled L ($10^{34} \text{ cm}^{-2}\text{s}^{-1}$)	Peak L ($10^{34} \text{ cm}^{-2}\text{s}^{-1}$)	Leveling time (h)
Standard L4	0.4	1.65	2.1	~1.4
BCMS	0.4	1.54	2.2	~2.1
Standard L4	0.5	1.65	1.9	~0.7
BCMS	0.5	1.54	2.0	~1.5
Standard	0.5	1.65	1.2	--

- BCMS & standard are very close in performance.
- Leveled L ~at the triplet limit, peak lumi BCMS / L4 above limit.
- With 2011 emittance model, values increase ~2%.

Add 5-10% to account for mixed fill length distribution

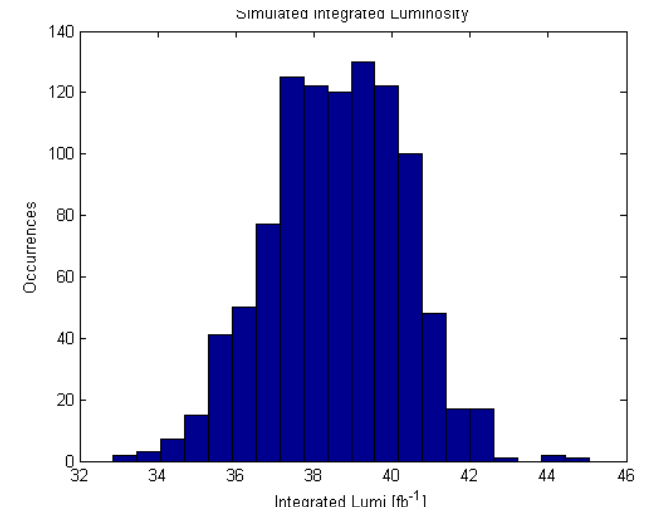

Courtesy J. Wenninger

Post-LS1 LHC: some results...

As 2012,
 turnaround time 5.5 → 6.2h
 Avg: 42.5 [fb⁻¹] (*reference*)

100 UFO dumps due to 7TeV
 Avg: 38.6 [fb⁻¹] (-10%)

SEU mitigation* (50 → 20)
 Avg: 43.3 [fb⁻¹] (+1.8%)

* Only SEU not requiring an intervention

- Summary of fault scenarios and impacts:

Failure Scenario/ Mitigation	Assumption	Simulated impact on Integrated Luminosity (BCMS)	Simulated impact on Integrated Luminosity (LINAC4)
1. 2012 Fault distributions	-	42.5 [fb ⁻¹] <i>(reference)</i>	42.7 [fb ⁻¹] <i>(reference)</i>
2. UFOs (6.5/7TeV)	100 UFO dumps	38.6 [fb ⁻¹] (-10 %)	39.0 [fb ⁻¹] (-10 %)
3. UFOs + BIQ	Factor 3 higher BLM thresholds, 33 UFOs, 3 BIQ	41.4 [fb ⁻¹] (-2.6 %)	41.5 [fb ⁻¹] (-2.8 %)
4. SEU mitigations	20 SEU dumps	43.3 [fb ⁻¹] (+1.8 %)	43.6 [fb ⁻¹] (+2.1 %)
5. SEU increase due to higher energy	60 SEU dumps (+50% wrt 2012)	41.7 [fb ⁻¹] (-1.8 %)	41.9 [fb ⁻¹] (-1.8 %)
6. Combined impact of scenarios 3 and 4	-	41.8 [fb ⁻¹] (-1.6 %)	42.1 [fb ⁻¹] (-1.4 %)

BCMS Predictions: Sensitivity Analysis

- Impact of Average Fault Time:

$$MFR = \frac{\# \text{ OF FILLS TO SB WITH FAILURES}}{\text{TOT} \# \text{ OF FILLS TO SB}}$$

- Monte Carlo model for Availability predictions
- Predictions for Post-LS1 Operation
- **Predictions for HL-LHC**
- Potential of Petri-Nets for Availability predictions
- Conclusions

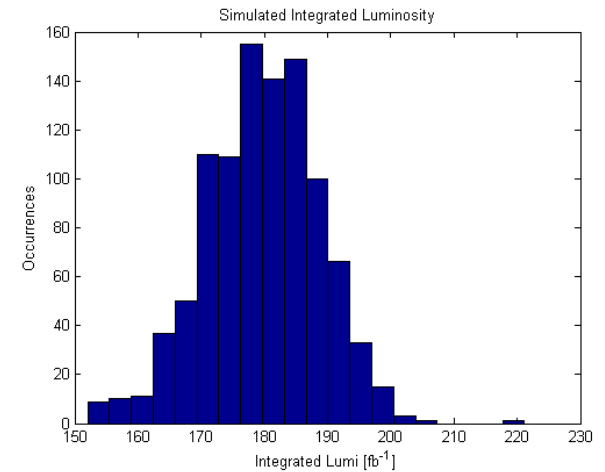

- **160 days of operation**
- $2.19 \cdot 10^{35}$ [cm⁻²s⁻¹] **virtual peak luminosity (Full HL)**
- **Levelling** at $5 \cdot 10^{34}$ [cm⁻²s⁻¹]
- **4.5 h average luminosity lifetime**
- **6.2 h average turnaround time**
- **4 logn distributions for the fault time + scenarios**
- **2 stable beams time distributions**
 - END OF FILL: gauss(mean 9.6 h)
 - EMERGENCY DUMPS: exp(mean 4.6 h)
- **Intensity ramp-up not included**

HL-LHC: some results...

As 2012,
 turnaround time 5.5 → 6.2h
 Avg: 213 [fb⁻¹] (*reference*)

100 UFO dumps due to 7TeV
 Avg: 179 [fb⁻¹] (-15%)

SEU mitigation (50 → 20)
 Avg: 220.5 [fb⁻¹] (+3%)

* Only SEU not requiring an intervention

- Summary of fault scenarios and impacts:

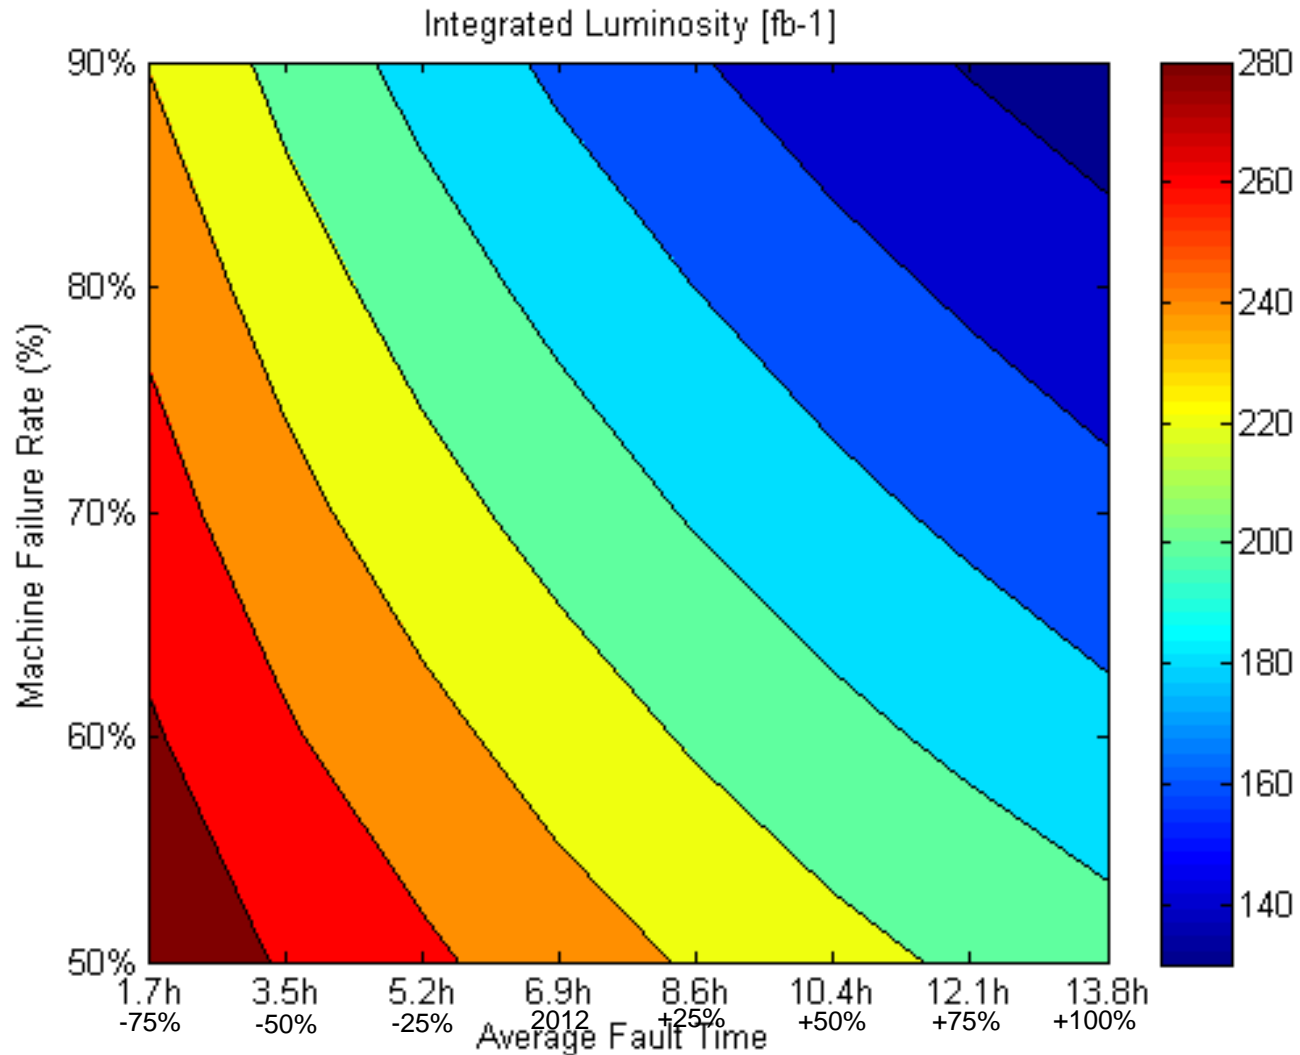

Failure Scenario/ Mitigation	Assumption	Simulated impact on Integrated Luminosity
1. 2012 Fault distributions	-	213 [fb ⁻¹] (<i>reference</i>)
2. UFOs (6.5/7TeV)	100 UFO dumps	179.5 [fb ⁻¹] (-15%)
3. UFOs + BIQ	Factor 3 higher BLM thresholds, 33 UFOs, 3 BIQ	203 [fb ⁻¹] (-5%)
4. SEU mitigations	20 SEU dumps	220.5 [fb ⁻¹] (+3%)
5. SEU increase due to higher energy	60 SEU dumps (+50% wrt 2012)	206 [fb ⁻¹] (-3%)
6. Combined impact of scenarios 3 and 4	-	208.5 [fb ⁻¹] (-2%)

- HL-LHC results are more sensitive to the selected fault scenarios given the longer levelling time
- Optimization of SB time can play a significant role for luminosity production

HL-LHC Predictions: Sensitivity Analysis

- Impact of Average Fault Time:

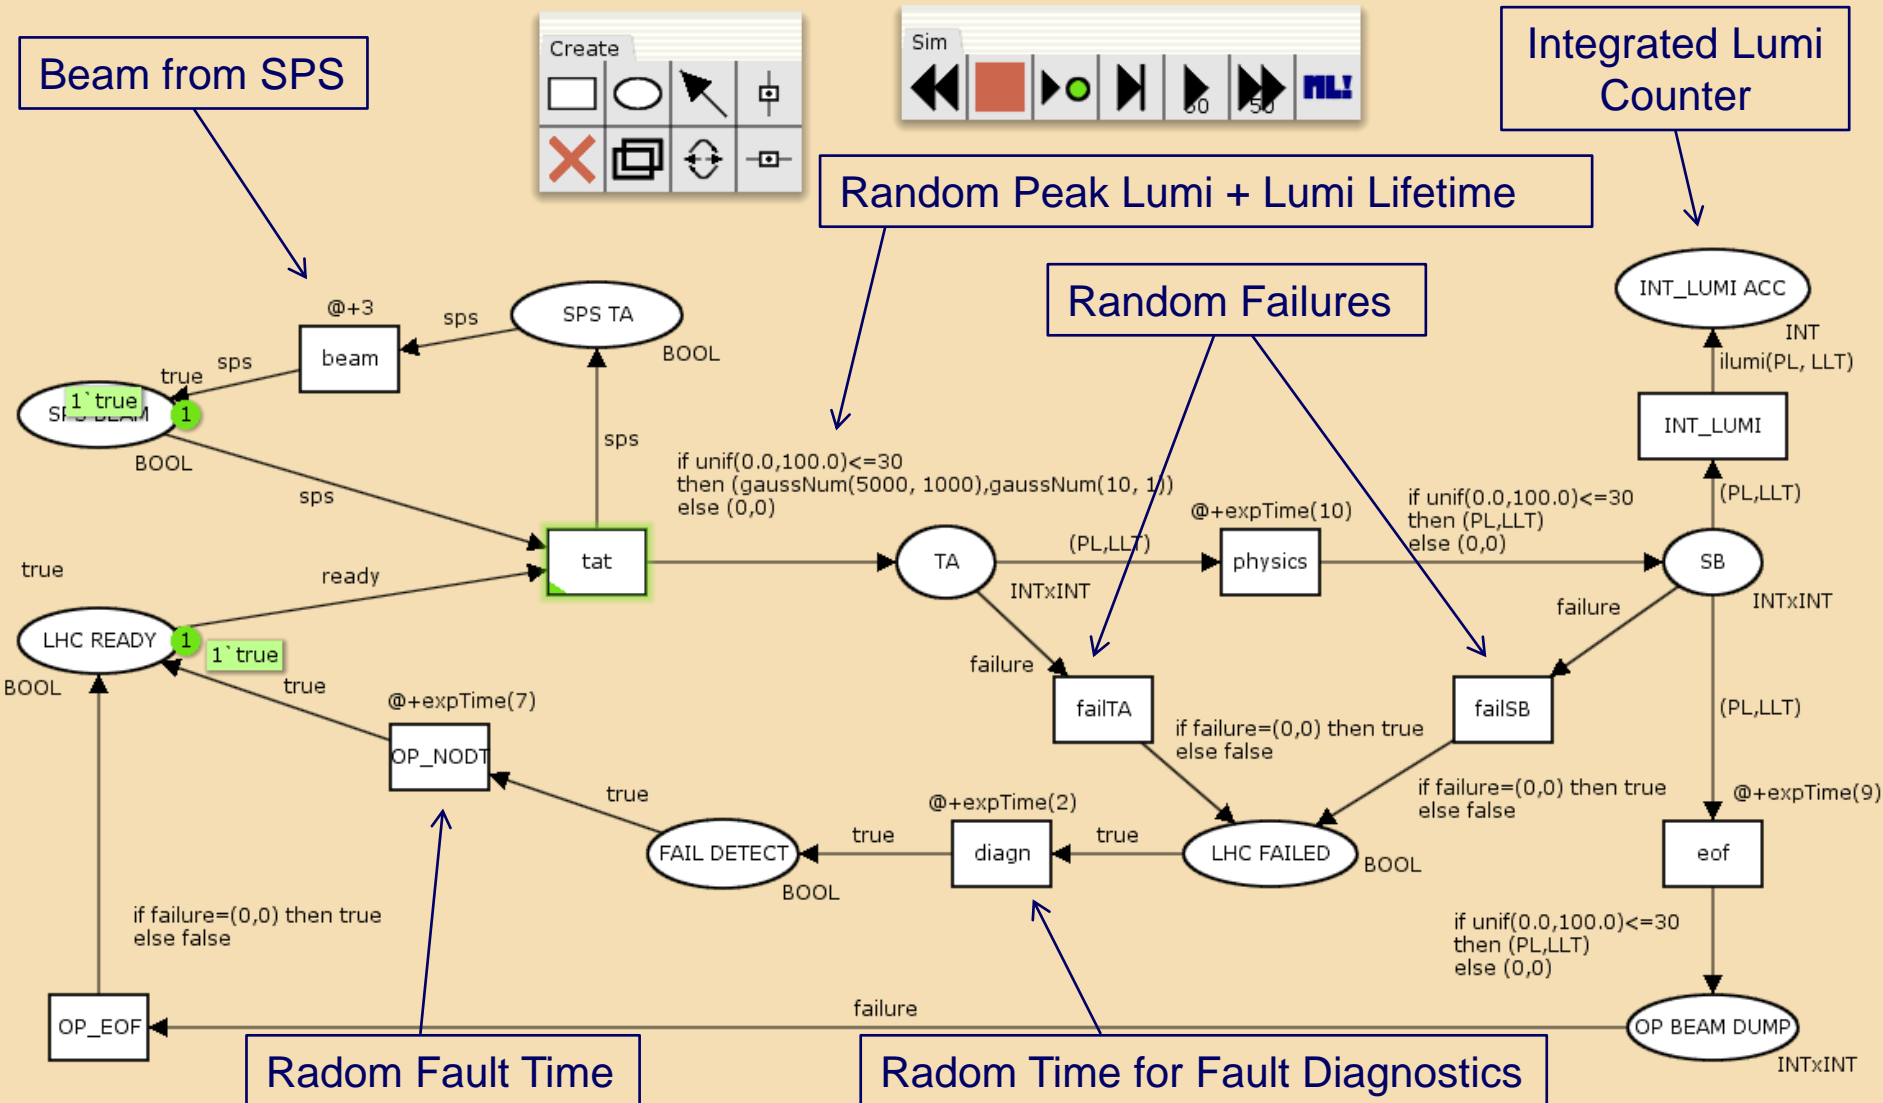

$$MFR = \frac{\# \text{ OF FILLS TO SB WITH FAILURES}}{\text{TOT \# OF FILLS TO SB}}$$

Preliminary Petri Net Model of LHC Operation*

* Using CPN Tools

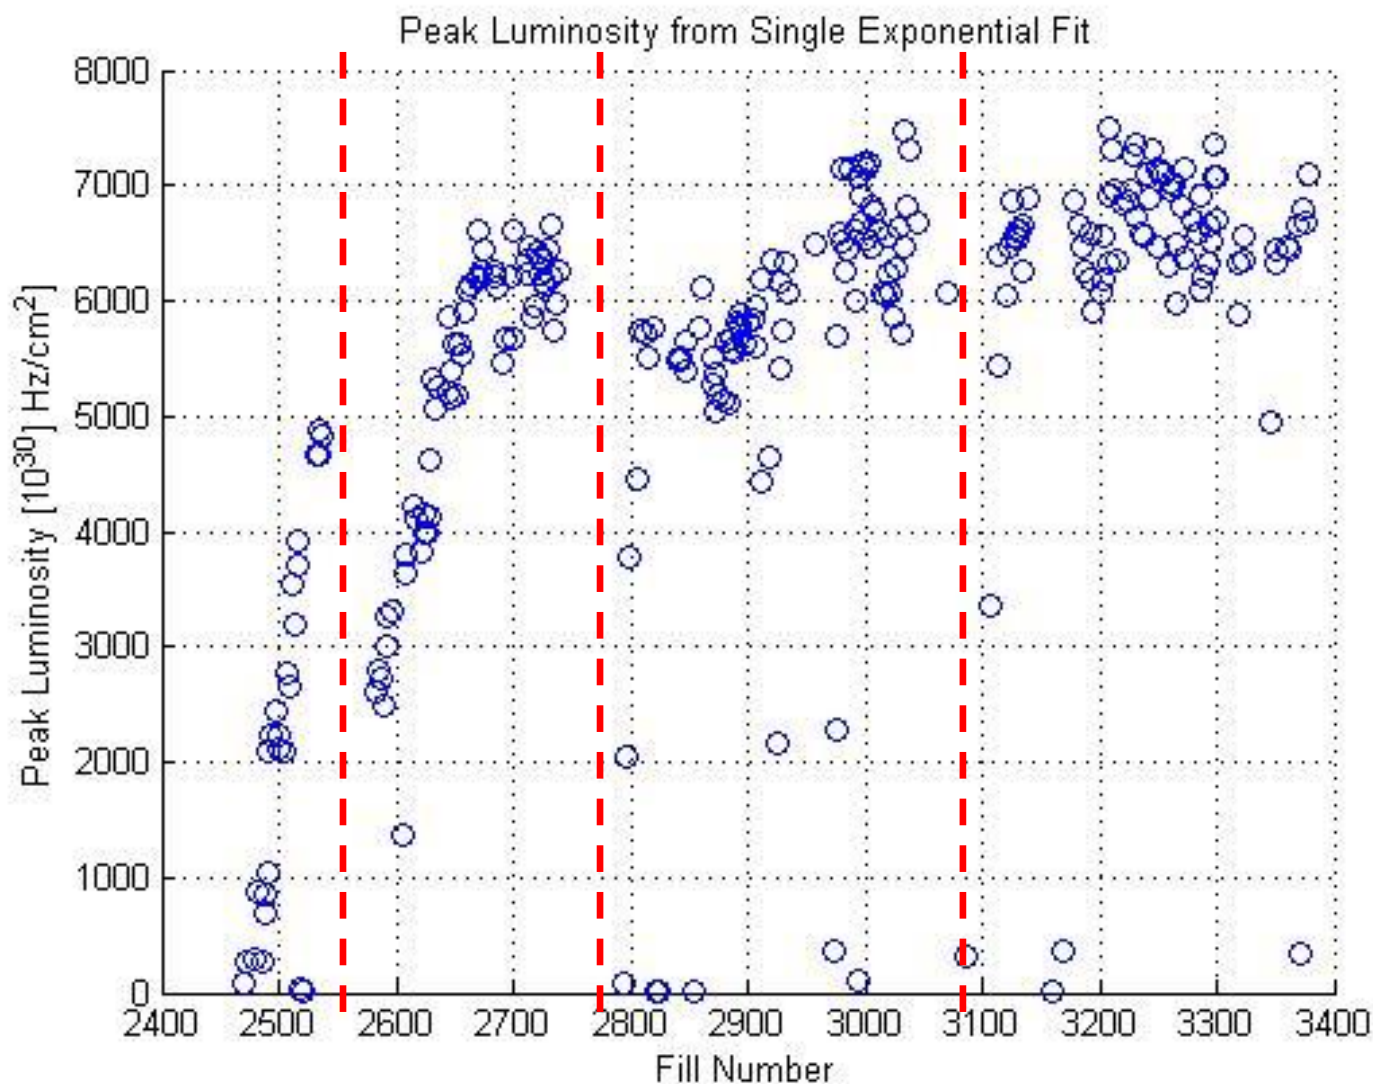

* Using CPN Tools

- Monte Carlo model for Availability predictions
- Predictions for Post-LS1 Operation
- Predictions for HL-LHC
- Potential of Petri-Nets for Availability predictions
- **Conclusions**

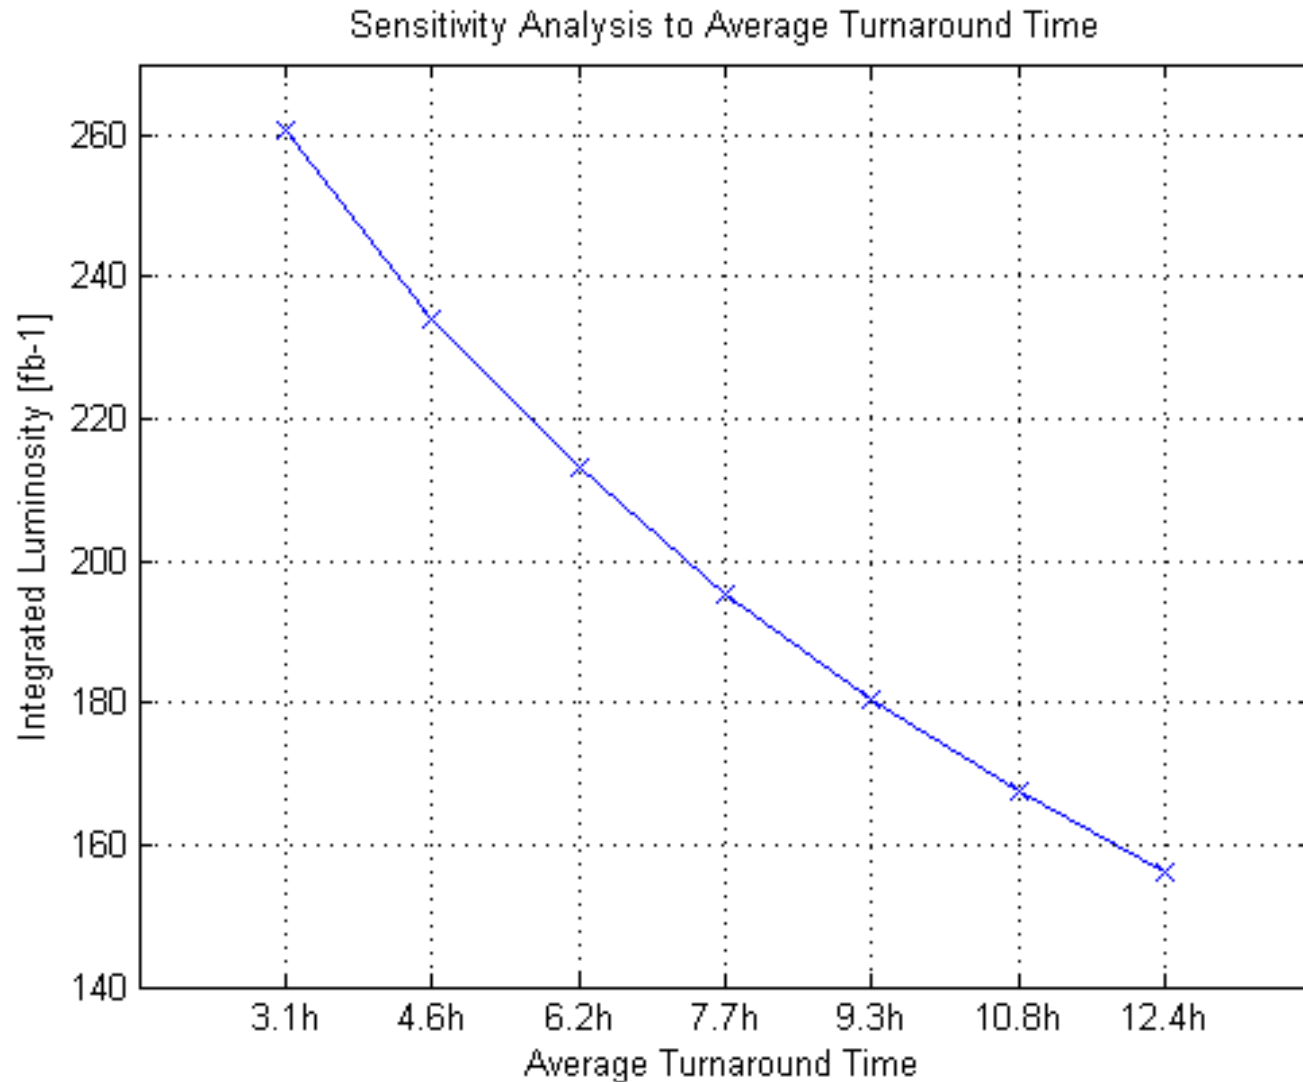

- **Increasing machine availability** towards better LHC performance will be one of the **big challenges** of the Post-LS1 era
- A model to **quantify the potential gain/loss** of integrated luminosity in different operational scenarios was developed in MATLAB
- Predictions could be improved with more **reliable data sources**, allowing for more accurate **data correlation**
- **UFOs** have the potential to be one of the **main limitations** for future LHC operation
- **Petri-Nets** could be exploited for Availability predictions and further modelling

**THANKS A LOT FOR
YOUR ATTENTION!**

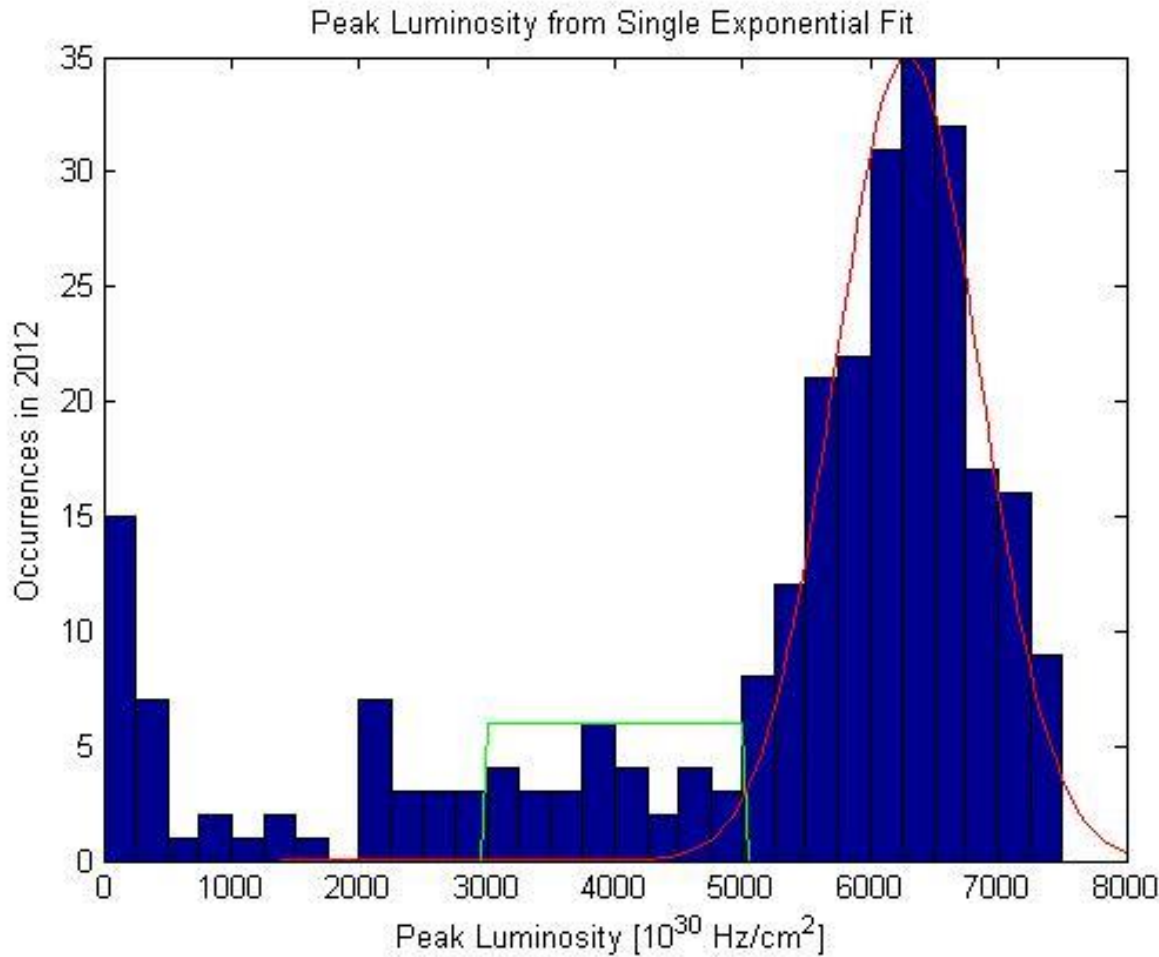

Peak Lumi distributions in 2012

- Impact of Turnaround Time, assuming 2012 fault distributions:

2012 Peak Luminosity

Unif Distribution:

- $a = 3000$ [Hz/cm²]
- $b = 5000$ [Hz/cm²]

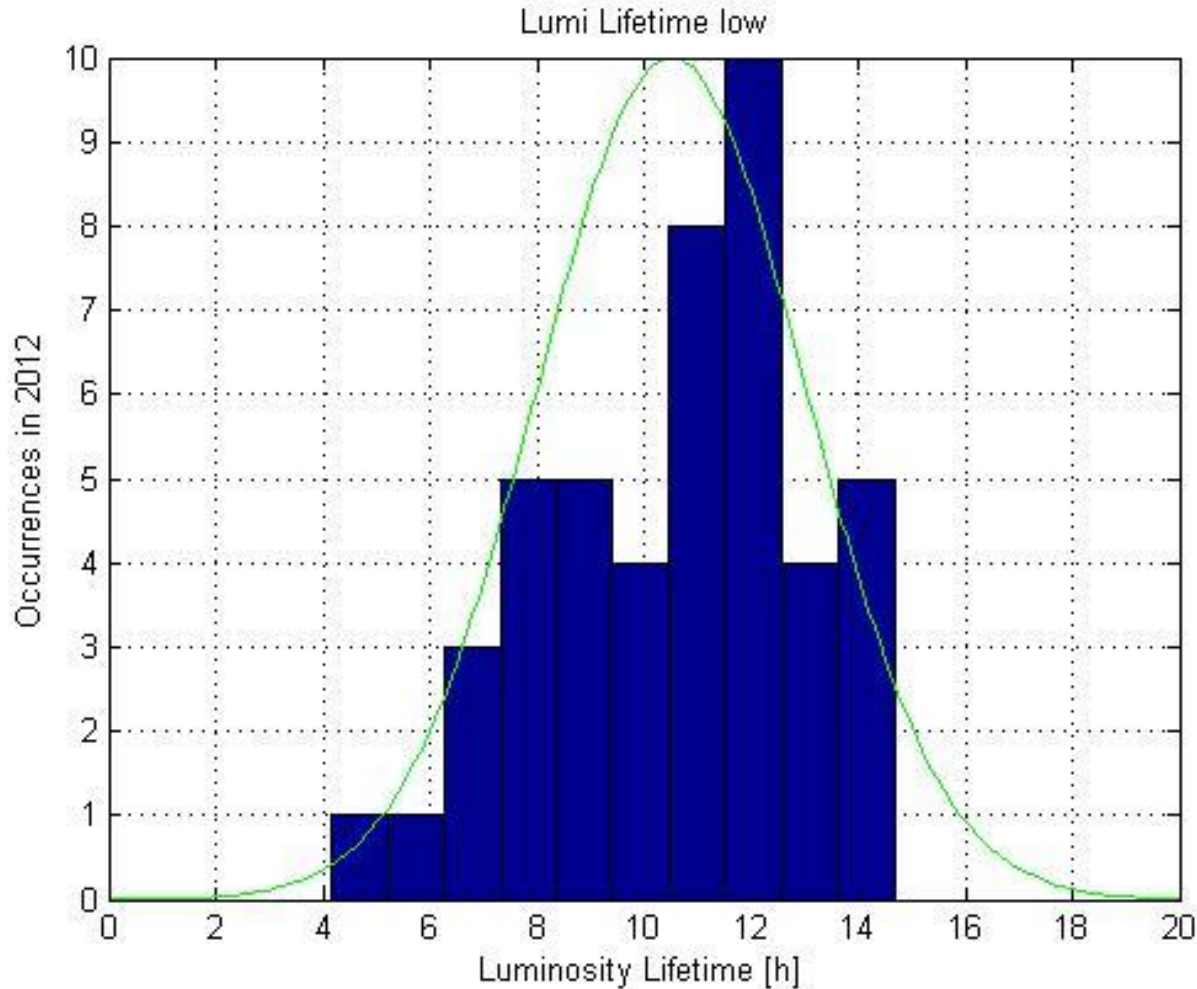

Norm Distribution:

- $\mu = 6285$ [Hz/cm²]
- $\sigma = 569$

“Low” Peak Lumi

“High” Peak Lumi

2012 Luminosity Lifetime (Low)

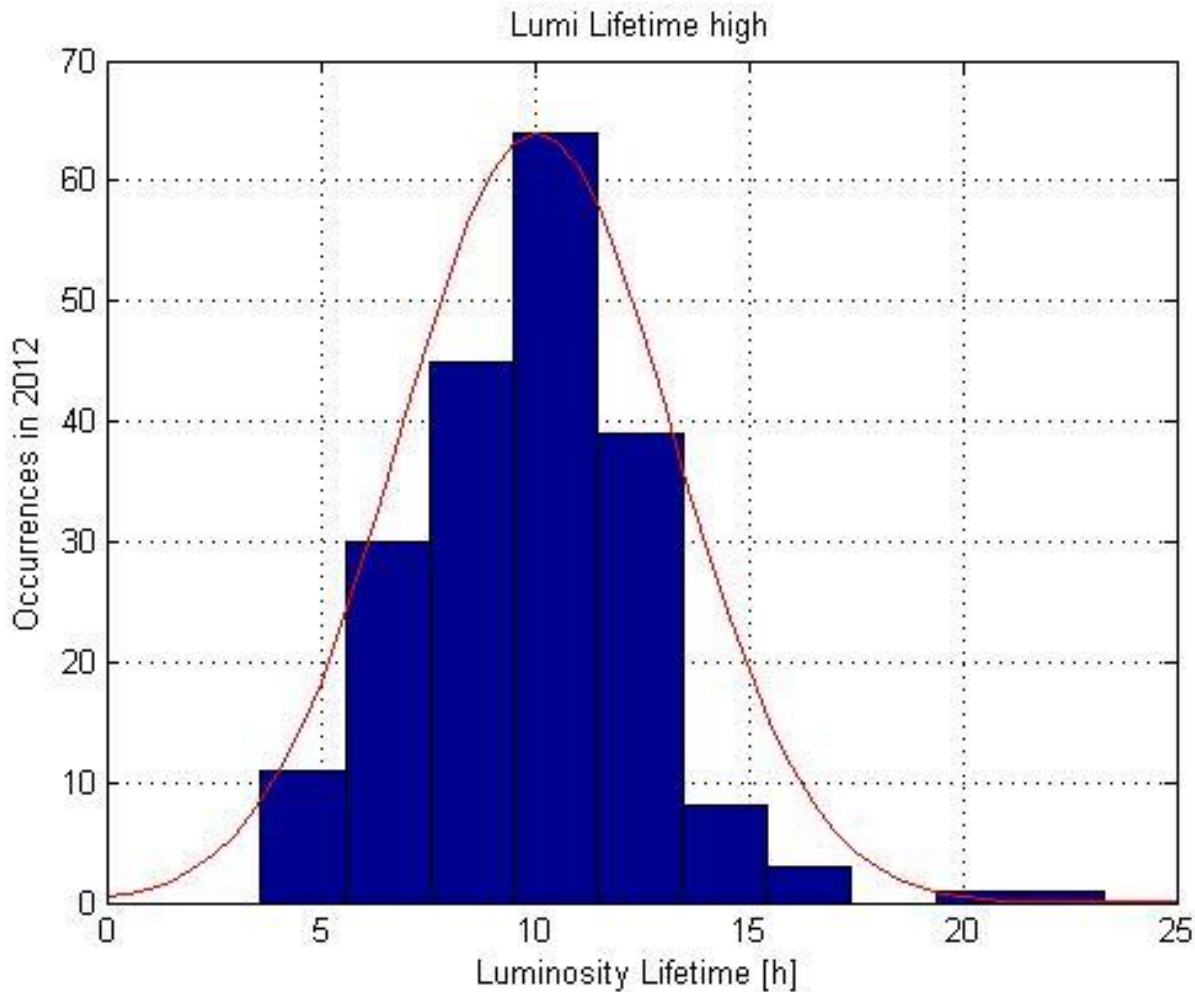

**Norm
Distribution:**

- $\mu = 10.5$ [h]
- $\sigma = 2.5$

“Low” Peak Lumi
“High” Peak Lumi

2012 Luminosity Lifetime (High)

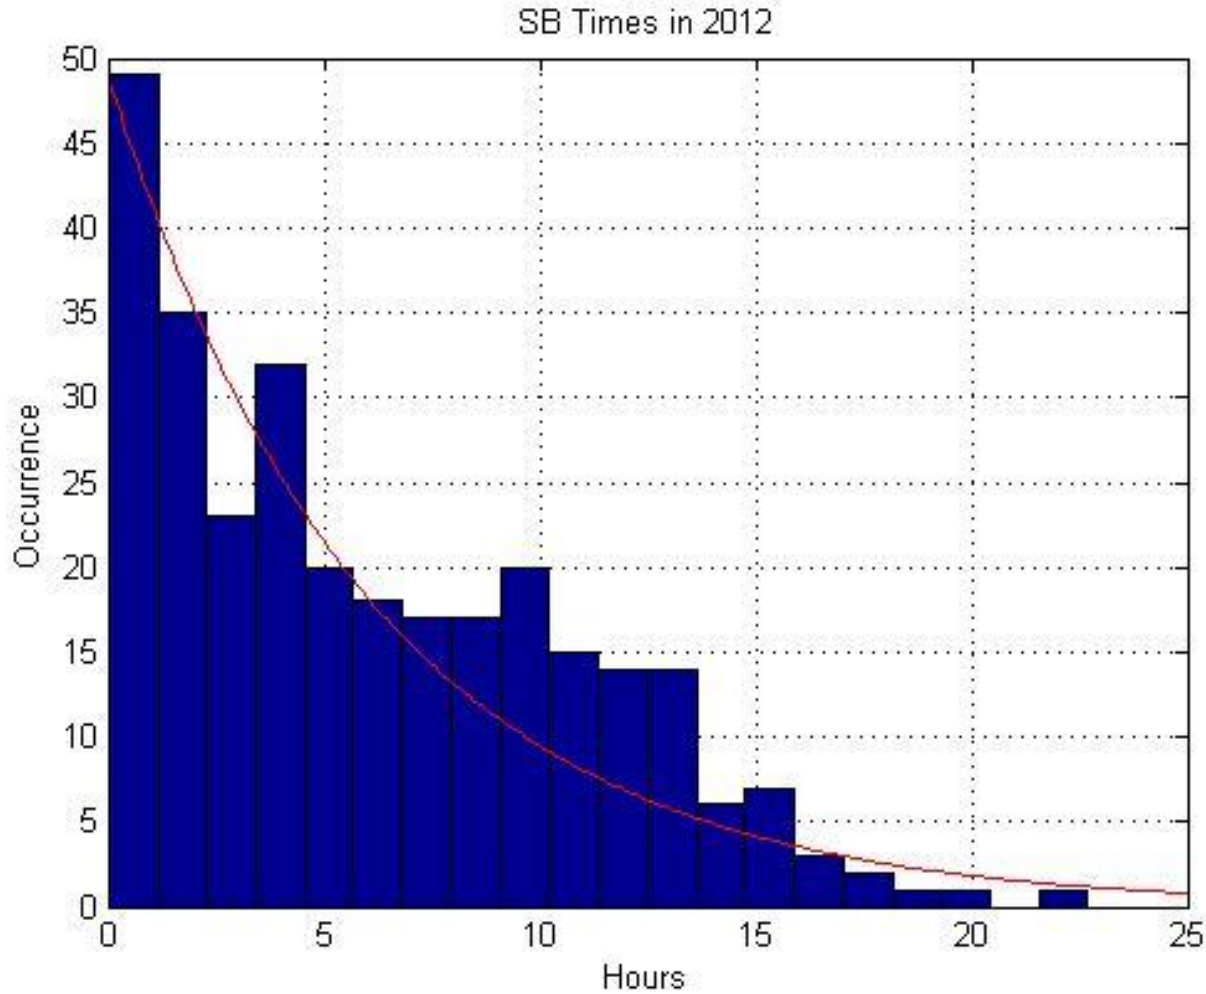

- Norm Distribution:**
- $\mu = 10.05$ [h]
 - $\sigma = 3.2$

“Low” Peak Lumi

“High” Peak Lumi

2012 SB Distribution

- Exp Distribution:**
- $\mu = 6.0809$ [h]
