## **Systematic uncertainties in dark matter searches due to halo asphericity**

*Monday, June 23, 2014 6:15 PM (15 minutes)*

We study the impact of aspherical dark matter density distribution in Milky-Way like halo on direct and indirect searches. Using data from large N-body cosmological simulation Bolshoi, we perform a complete statistical analysis and quantify the systematic uncertainties that affect the determination of local dark matter density and  $J$  factors for annihilating and decaying dark matter. We find that the systematic effects can be as large as 50% at 95% CL for a spherically averaged local density of  $0.3 \text{ GeV/cm}^3$ . Similarly, systematic uncertainties for  $J$  factors evaluated around the galactic center can be as large as 20% and 15% at 95% CL for decaying and annihilating dark matter, for typical NFW profiles.
