On gamma ray spectral features from scalar dark matter

Wednesday, June 25, 2014 5:35 PM (15 minutes)

In this talk I will discuss some recent results regarding the gamma ray spectral features from the annihilation of a scalar dark matter particle interacting through a charged particle in the t-channel. In particular I will discuss the relative enhancement of the Bremsstrahlung signal and will present a new calculation of the annihilation in gamma ray lines. I will also present some preliminary results regarding direct detection.
