Scintillation of argon

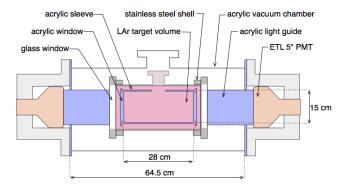

- Light (128 nm) is produced with the dissociation of Ar_2^* .
- Two molecular states of Ar₂^{*}; singlet and triplet, with very different lifetimes: 7 ns vs. 1.5 μs.
- 1,1,4,4-Tetraphenyl-1,3-butadiene (TPB) used to shift the light to the easier to detect 420 nm.

DEAP development program

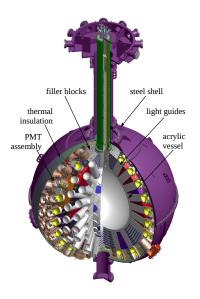

DEAP-1: 7 kg LAr target in various configurations

Significant radon reduction and backgrounds understanding gained, as well as confirmation of pulse shape discrimination. Two papers submitted to Astroparticle Physics.

DEAP-3600: design

- Contains 3600 kg argon target (1000 kg fiducial) sealed in an ultra-clean acrylic vessel.
- The acrylic vessel is "resurfaced" in-situ to remove deposited Rn daughters after construction.
- TPB is then deposited in a clean, vacuum environment.
- Array of 255 Hamamatsu R5912 HQE PMTs: 8", 32% QE, 75% coverage
- Connected with 50 cm light guides plus PE shielding provide neutron moderation.
- Inside 8 m water shield at SNOLAB.

DEAP-3600: basic parameters

Parameter	Value
Light yield	8 pe per keVee
Nuclear quenching factor	0.25
Analysis threshold	15 keVee (60 keVr)
Total argon mass (radius)	$3600 { m ~kg} (80 { m ~cm})$
Fiducial mass (radius)	$1000 { m kg} (60 { m cm})$
Position reconstruction resolution	$< 6.5 { m ~cm}$
Background specification	Target
Radon in argon	< 1.4 nBq/kg
Surface α	$< 100 \ \mu Bq/m^2$
Neutrons in fiducial volume	$< 2 \mathrm{pBq/kg}$
β/γ events (after PSD)	$< 2 \mathrm{~pBq/kg}$
Total backgrounds	< 0.3 events in 3 tonne-year

Physics reach

DEAP-3600 sensitive to SI DM interactions at 10^{-46} cm² at 100 GeV. A factor of 23 improvement at high WIMP mass over current LUX leading result.

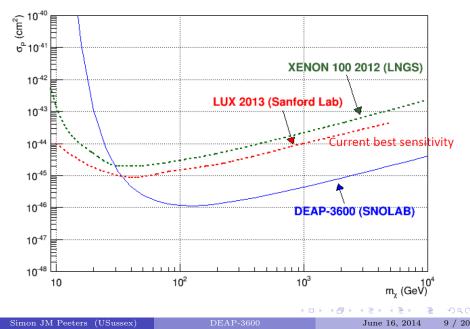

Adapted from: C. Strege et al. Journal of Cosmology and Astroparticle Physics, 4, 2013.

Going beyond DEAP-3600

Basic design concept

- Single-phase DAr, 50 tonnes fiducial mass
- Large inner vessel: Initial discussion with Reynolds polymers are very encouraging.
- Surrounded by 12" clear, ultra-low background acrylic panels
- Large double-walled cryostat with immersed in water shield.
- Planned location: SNOLAB cryopit.

Neutrino backgrounds

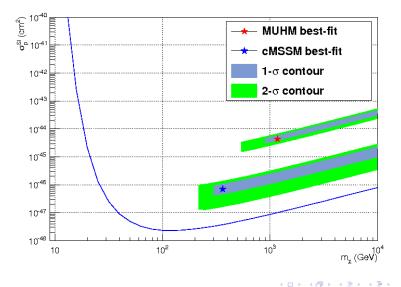

Neutrino backgrounds for Ar and Xe, adapted from L.E. Strigari, ArXiv:0903.3630.

The ultimate background is coherent scattering of atmospheric neutrinos.

Simon JM Peeters (USussex)

19 / 20

Conclusions

- single-phase liquid argon is a very exciting and promising technique for expanding the direct detection of Dark Matter searches with great discovery potential.
- DEAP-3600 is will be taking data *this fall* and expected to improve the current SI DM limit by a factor of 23.
- Proposal being developed for the 50-tonne follow-up, with ultimate sensitivity dictated by atmospheric neutrinos.
