## Diffuse Neutrino Flux from Star-forming Galaxies

*Tuesday 24 June 2014 15:30 (15 minutes)*

Star-forming galaxies are predicted to contribute considerably to the cosmic gamma-ray background as they are the most numerous population of gamma-ray sources. The hadronic interactions responsible for high-energy gamma rays also produce high-energy neutrinos. We discuss the expected intensity of the diffuse high-energy neutrinos from star-forming galaxies and conclude that such a population could be the main contributor to the high-energy neutrinos observed by the IceCube experiment.
