

Muon Simulation and Cavern Background

Draft for LPCC Detection
Simulation Workshop
March 18-19, 2014

Piet Verwilligen

INFN Sezione di Bari

Simulation Meeting
2014-03-14

Disclaimers

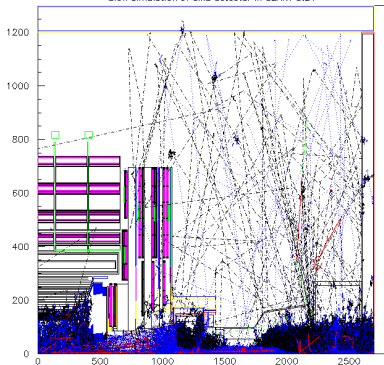

- ▶ I give this presentation not on behalf of the CMS Muon Community.
- ▶ This presentation is about the machinery for the simulation of Neutron background in the Muon System and will show it works.
- ▶ Simulation results here are only for **illustration**, are not approved by the Muon Community and hence **can not be used as CMS result**.
- ▶ We will start investigating those results soon and interpret them in the context of background rates, compare to data, ...
- ▶ This is just the start of the work ...

Introduction :: Neutron Background

Illustration

One minimum bias event generated with Pythia 6 and simulated in one quadrant of CMS by GEANT 3.21 in CMSIM. Products tracked to 1 sec after collision. [Tim Cox, UC Davis, 1998]

Slow simulation of CMS detector in GEANT 3.21

The colour and line style corresponds to the track type :

(blue)	dotted line for gammas	-----
(red)	solid line for charged particles (except muons)	_____
(black)	blank/dotted line for neutral hadrons or neutrinos
(green)	dashed line for muons	- - - -
(yellow)	dotted line for Čerenkov photons

Physics Processes

- ▶ pp -collisions induce hadronic cascades in HCAL, Absorbers
- ▶ End product are long-living neutrons of $\mathcal{O}(100 \text{ MeV})$ which are then moderated to $\mathcal{O}(\text{MeV})$
- ▶ $\frac{1}{0}n$ propagate through steel
- ▶ **CMS embedded in a $\frac{1}{0}n$ gas**
- ▶ neutrons are captured in nuclei, emitting a γ of $\mathcal{O}(0.5\text{-}10 \text{ MeV})$
- ▶ γ produces e^{\pm} of $\mathcal{O}(\text{MeV})$ through Compton scattering or Photo-electric effect
- ▶ hits in muon chambers due to elastic (n,p) collisions (in gas) or from $\gamma \rightarrow e^{\pm}$ (inside & close to muon chamber) (dominant process)

Introduction :: Impact on Muon Detectors

Cathode Strip Chamber

Impact on Muon Detectors

- ▶ Precision Chambers (DT, CSC)
 - ▶ multiple gas layers (6-12)
 - ▶ reconstruct 3D track stubs
 - ▶ e^\pm do not penetrate all layers
 - ▶ bckgnd hits cannot make track stub
 - ▶ bkgnd hits can disturb measurement
- ▶ Timing Chambers (RPC)
 - ▶ double gas, single readout layer
 - ▶ reconstruct 2D hits
 - ▶ all charged particles make hits
 - ▶ hits disturb p_T measurement in Pattern Recognition (PAC)

Pattern Recognition

Implementation in Simulation

- ▶ CSC, DT :: no background hits
- ▶ RPC :: bkg hits + intrinsic noise

Introduction :: Simulation Tools

FLUKA — current simulation tool

- ▶ Calculation Particle Transport & Interactions w/ matter
- ▶ Calculation of Flux & Fluence
 - ▶ Beam & pp -collisions background
 - ▶ Test shielding designs
 - ▶ Radation levels
- ▶ Does not provide hit rates
- ▶ Hit rates = Sensitivity \times Flux
- ▶ Sensitivity averaged over Energy spectrum particle
- ▶ Sensitivity for each detector

GEANT4 — possible future simulation tool?

- ▶ Passage of particles through matter
- ▶ Simulation of the detector response of gen. events
- ▶ So far used for **Signal** and **Min Bias** (PU) events
- ▶ E_{dep} in sensitive volumes (simhits)
- ▶ Simhits digitized \rightarrow electronic signals
- ▶ Can be used to predict **Hit Rates**
- ▶ Mix **Signal** + **Neutron Background** + **Pile Up**

Introduction :: Muon Upgrade

Muon Upgrade during LS1

- ▶ New CSCs: 67 ME4/2 (5 installed in 2012)
- ▶ New RPCs: 72 RE4/2 and 72 RE4/3
- ▶ New Yoke: YE4 (Borated Concrete)

- ▶ Pre-LS1 high rates in ME4/2, lower in Post-LS1 (YE4 Shielding)

Results :: E_{kin} vs tof :: XS & 2015

GEANT Simulation

- ▶ CMS 2015 Detector Geom
 - ▶ GEANT 4.9.6
 - ▶ XS & HP Physics List:
FTFP_BERT_XS_EML
FTFP_BERT_HP_EML
 - ▶ 2500 Minimum Bias Events
up to 100 ms ($> > 500$ ns)
 - ▶ **Time Of Flight vs E_{kin}**
-
- ▶ Limit of 250 ns chosen arbitrarily
 - ▶ tof > 250 ns **neutron hits**
 - ▶ tof < 250 ns **prompt & decay**

Particle Range (CSC)

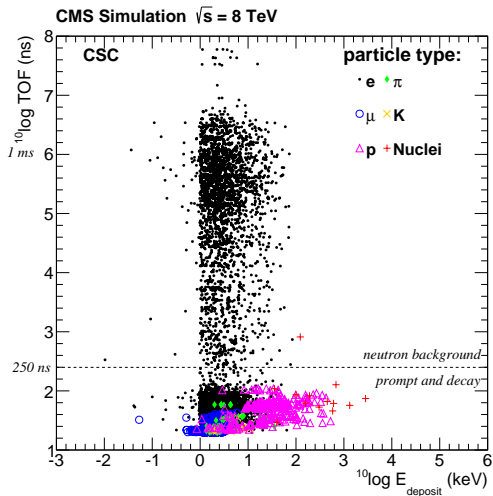

ProdCutsForGamma = 25.*mm
 ProdCutsForElectrons = 1.*mm
 ProdCutsForPositrons = 2.5*mm

 E_{kin} vs tof in CSC

Similar plots available for DT & RPC

Results :: RZ & E_{dep} vs tof :: XS & 2015

4th station

Challenges :: Geometry

- ▶ for CSC and DT the inclusion of neutron hits is straight forward but
 - ▶ DT simulation will also benefit from introduction of dead channels (not implemented now)
 - ▶ DT are slow ... signal integration over 16BX (current sim is $\pm 3\text{BX}$)
- ▶ DT, RPC and CSC observe φ -asymmetry due to cavern floor:
 - ▶ tests of new geometry ongoing
- ▶ RPC Digitization is parametrized:
 - ▶ only muon hits are digitized
 - ▶ close-by electron hits (δ) are inside **Clustersize** parametrization
 - ▶ background electron hits are included in **Noise** parametrization
 - ▶ need to be desentangled
- ▶ RPC consist of single layer of Bakelite-Gas-Bakelite sandwich:
 - ▶ 50 % of gas volume implemented
 - ▶ need to be improved in order to have same infrastructure for DT, CSC & RPC

Challenges :: Geometry

- ▶ for CSC and DT the inclusion of neutron hits is straight forward but
 - ▶ DT simulation will also benefit from introduction of dead channels (not implemented now)
 - ▶ DT are slow ... signal integration over 16BX (current sim is $\pm 3BX$)
- ▶ DT, RPC and CSC observe φ -asymmetry due to cavern floor:
 - ▶ tests of new geometry ongoing
- ▶ RPC Digitization is parametrized:

 - ▶ need to be desentangled
- ▶ RPC consist of single layer of Bakelite-Gas-Bakelite sandwich:
 - ▶ 50 % of gas volume implemented
 - ▶ need to be improved in order to have same infrastructure for DT,CSC & RPC

Challenges :: Comparison w.r.t Data

8 TeV Data

- ▶ Hit rate based on digis
- ▶ Results for Barrel and Endcap stations are available at:
- ▶ <https://twiki.cern.ch/twiki/bin/view/CMSPublic/RPCPlots>

8 TeV Simulation

- ▶ Hit rate based on simhits
- ▶ Preliminary work — First look
- ▶ Improvements: Cls, ProdCuts

At instantaneous luminosity of $\mathcal{L} = 0.6 \times 10^{34} \text{ cm}^{-2} \text{ s}^{-1}$:

- ▶ Barrel: $1.4 \text{ Hz}/\text{cm}^2$ in Simulation vs $1.8 \text{ Hz}/\text{cm}^2$ in Data
- ▶ Endcap: $2.6 \text{ Hz}/\text{cm}^2$ in Simulation vs $4.8 \text{ Hz}/\text{cm}^2$ in Data
- ▶ Total: $1.8 \text{ Hz}/\text{cm}^2$ in Simulation vs $3.0 \text{ Hz}/\text{cm}^2$ in Data

Conclusions & Outlook

- ▶ **Neutron background** will be important background at the LHC at higher Energies and higher Instantaneous Luminosities
- ▶ **GEANT4** Simulation of neutrons has improved over the years and can be reliable to predict neutron background events in CMS
- ▶ First steps towards **unified** integration of **Neutron background** in the 3 muon systems of CMS: DT, CSC & RPC are made:
 - ▶ Understand background components
 - ▶ Comparison XS physics list with HP physics list
 - ▶ Comparison with Data ongoing, discussion in Muon Community about to start
- ▶ Will **drive more development** in implementation of the simulation:
 - ▶ Double-Gap geometry for RPC detectors
 - ▶ Investigate Energy cut-offs
 - ▶ Implement realistic Cavern
 - ▶ Improve Digitization model
- ▶ Understand & predict current backgrounds pave the way for HL-LHC

Thanks

I would like to thank:

▶ **CMS Simulation group:**

- ▶ for support and help with generation of the events: Vladimir Ivantchenko
- ▶ for useful discussions: Vladimir Ivantchenko, David Lange, Mike Hildreth

▶ **CMS Muon DPG conveners:**

- ▶ Tim Cox, Francesca Cavallo, Alberto Ocampo for useful discussions

▶ **People working on Neutron backgrounds in CMS in the past:**

- ▶ Tim Cox, Rick Wilkinson, Vadim Khotilovich, Alexei Safanov, . . .
- ▶ **they paved the way and did great progress and without them this was not possible**

Back up :: RZ-view simhit plots :: lots to learn

$0 < \text{tof} < 50 \text{ ns}$

- ▶ Prompt Muons are visible
- ▶ Punch-through in MB1 and ME1/1, ME2/1
- ▶ e^\pm not always related to muons or hadrons

$50 < \text{tof} < 250 \text{ ns}$

- ▶ e^\pm hits in MB4
- ▶ e^\pm hits in Endcap
- ▶ due to fast neutrons?
- ▶ Hadron hits in ME3/1, ME4/1 (HF backplash)

$250 \text{ ns} < \text{tof}$

- ▶ Mostly e^\pm hits
- ▶ Single hadron hit (but not enough?)
- ▶ $\frac{n \rightarrow p}{n \rightarrow \gamma \rightarrow e} \approx \mathcal{O}(10^3)$
