Parameters

| Parameter | [Units] | TLEP t A | TLEP t B |
|---|--|-----------|------------|
| Beam energy E_{beam} | [GeV] | 175 | 175 |
| Circumference f_{rep} | [km] | 100 | 100 |
| Bunch population N_e | [10^{11}] | 0.88 | 7.0 |
| Number of bunches n_b | | 160 | 20 |
| Bunch length σ_z | [mm] | 0.77 | 1.95 |
| IP beam size σ_x^*/σ_y^* | [μm] | 45/0.045 | 126/0.126 |
| Emittance (IP) ϵ_x/ϵ_y | [nm] | 2.0/0.002 | 16.0/0.016 |
| Beta functions (IP) β_x^*/β_y^* | [m] | 1.0/0.001 | 1.0/0.001 |
| Luminosity \mathcal{L}_T | [$10^{34}\text{cm}^{-2}\text{s}^{-1}$] | 1.32 | 1.04 |

- We mainly focus on TLEP t A (Small emittance).

Final Focus Optics

 $L^* = 3.5$ m $L^* = 2.0$ m

| L^* [m] | Magnet | L [m] | k [m^{-2}] | G [T/m] | Ap. rad. ($15\sigma_x$) [mm] | B ($15\sigma_x$) [T] |
|-----------|--------|-------|------------------|---------|--------------------------------|------------------------|
| 3.5 | QD0 | 2.02 | -0.195 | 113.6 | 3.4 | 0.4 |
| 3.5 | QF1 | 1.15 | 0.195 | 113.6 | 9.8 | 1.11 |
| 2.0 | QD0 | 2.66 | -0.195 | 113.6 | 2.6 | 0.3 |
| 2.0 | QF1 | 1.16 | 0.195 | 113.6 | 9.8 | 1.11 |

Apertures $L^* = 2.0$ m, TLEP A

Nonlinear optimization

MAPCLASS Beam sizes $L^* = 3.5$ m

$$\sigma_x^*(A) = 44.21 \mu\text{m}, \sigma_y^*(A) = 45.71\text{nm}$$

$$\sigma_x^*(B) = 124.49 \mu\text{m}, \sigma_y^*(B) = 137.48\text{nm}$$

MAPCLASS Beam sizes $L^* = 2.0$ m

$$\sigma_x^*(A) = 44.47 \mu\text{m}, \sigma_y^*(A) = 45.09\text{nm}$$

$$\sigma_x^*(B) = 125.37 \mu\text{m}, \sigma_y^*(B) = 137.42\text{nm}$$

Stability: Tunes. Horizontal plane

$L^* = 3.5 \text{ m}, Q_x = 377.51$

$L^* = 2.0 \text{ m}, Q_x = 378.51$

- For $L^* = 3.5 \text{ m}$ horizontal tune seems more stable than for $L^* = 5.0 \text{ m}$.
- Compared to the vertical plane it does not impose a big constraint.

Stability: Tunes. Vertical plane

 $L^* = 3.5 \text{ m}, Q_y = 250.51$  $L^* = 2.0 \text{ m}, Q_y = 250.51$ 

- Stability does not improve considerably when L^* is reduced.
- A maximum of $\pm 1\%$ momentum acceptance seems possible with a bit more time.
- Perhaps negative values of dp/p are more relevant when we take into account beamstrahlung.

Horizontal phase space. n momentum $dp/p = 0.0$. tlep AWithout low- β RING7-TEIL7: Tracking in x-px ($\varepsilon_x = 16$ nm, $\varepsilon_y = 0.016$ nm, $dpp = 0.00$)New-FFS-RING7-TEIL7: Tracking in x-px ($\varepsilon_x = 2$ nm, $\varepsilon_y = 0.002$ nm, $dpp = 0.00$)

RING7-TEIL77 (PT = 0.00)

Vertical phase space. On momentum $dp/p = 0.0$. tlep AWithout low- β New-FFS-RING7-TEIL7: Tracking in y-py ($\epsilon_x = 2$ nm, $\epsilon_y = 0.002$ nm, dpp = 0.00)

RING7-TEIL77 (PT = 0.00)

Horizontal phase space. Off momentum $dp/p = 1\%$. tlep AWithout low- β RING7-TEIL7: Tracking in x-px ($\varepsilon_x = 16$ nm, $\varepsilon_y = 0.016$ nm, dpp = 0.01)New-FFS-RING7-TEIL7: Tracking in x-px ($\varepsilon_x = 2$ nm, $\varepsilon_y = 0.002$ nm, dpp = 0.01)

RING7-TEIL77 (PT = 0.01)

Vertical phase space. Off momentum $dp/p = 1\%$. tlep AWithout low- β RING7-TEIL7: Tracking in y-py ($\epsilon_x = 2$ nm, $\epsilon_y = 0.002$ nm, dpp = 0.01)New-FFS-RING7-TEIL7: Tracking in y-py ($\epsilon_x = 2$ nm, $\epsilon_y = 0.002$ nm, dpp = 0.01)

RING7-TEIL77 (PT = 0.01)

Conclusions and future prospects

- After L^* reduction from 3.5 to 2.0 m a gain in dynamic aperture has been observed but not a real gain in momentum acceptance.
- Momentum acceptance of $\sim \pm 1\%$.
- It seems that small momentum acceptance is not only determined by L^* and other sources. It needs to be understood.
- Reoptimization in detail of the Final Focus System is being considered.
