

# Beyond the (already observed) Higgs

Gabriella Pásztor  
[[Gabriella.Pasztor@cern.ch](mailto:Gabriella.Pasztor@cern.ch)]

Zimányi School, Budapest, 6 December 2013

# Status quo: the Standard Model after LHC Run1

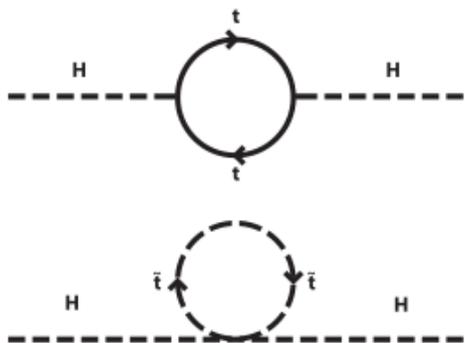

- ATLAS and CMS discovered a Higgs boson with  $m = 125.5$  GeV, so far compatible with SM
- No other new particle seen at LHC
- SM complete and describes with huge success phenomena observed in collider experiments
- **SM can not be the final theory!**
- Deviations due to new physics (in the Higgs sector and elsewhere) might be subtle
- Precision measurements might give the key to discoveries
- ... parallel to direct searches for new physics!

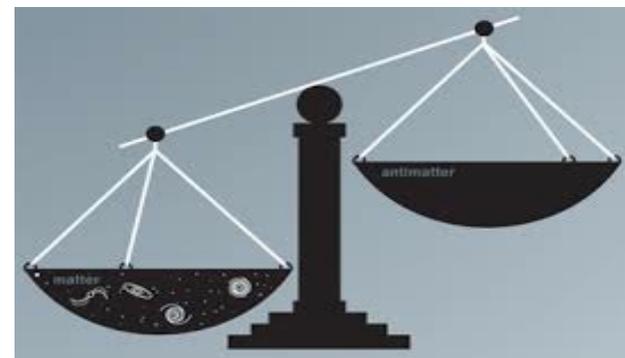

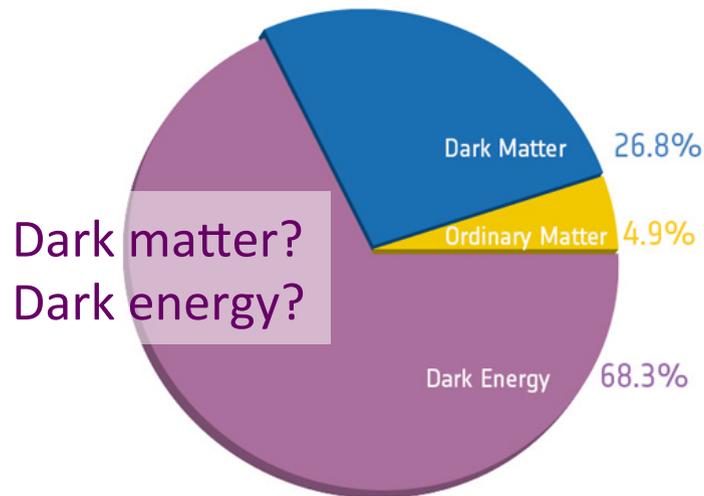

- BEH mechanism provides mass to the W and Z bosons
- Higgs boson regularizes weak vector-boson scattering and makes the theory consistent

# Why go beyond the Standard Model?

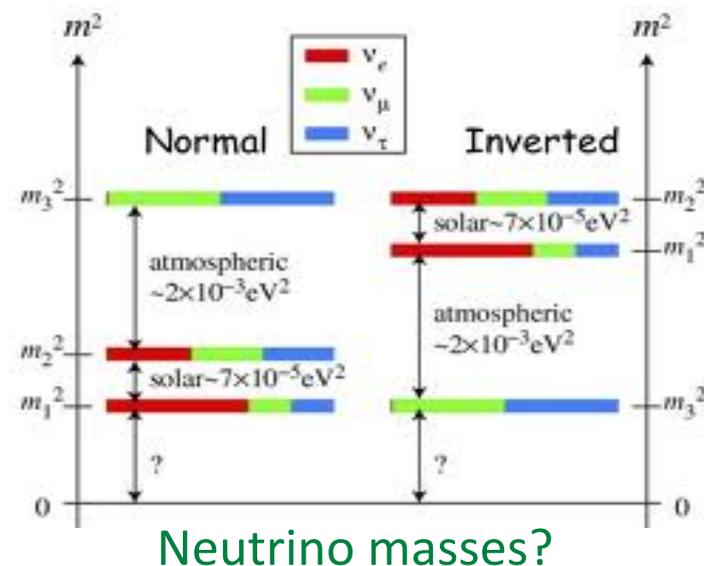

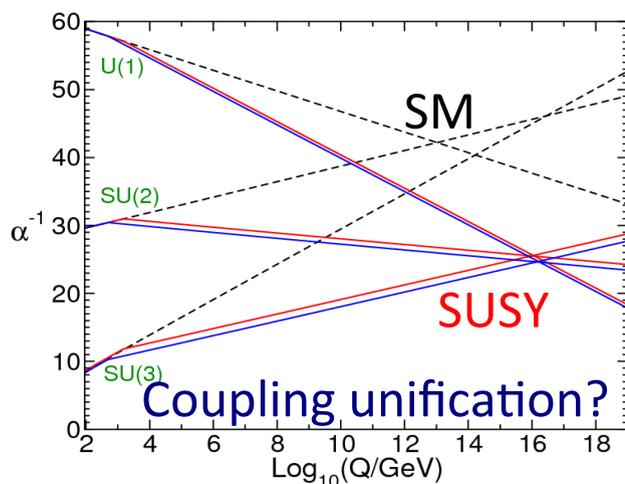

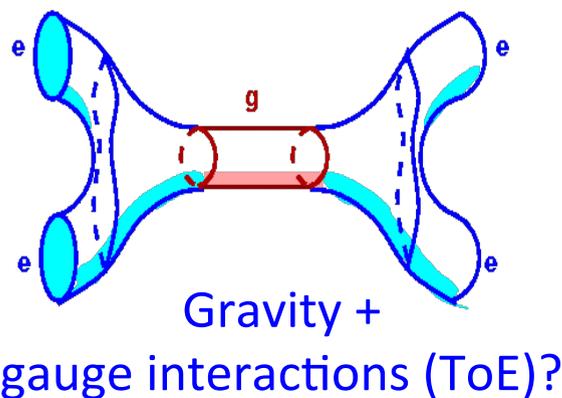

Conceptual weaknesses, observational hints!

Higgs mass stability?  
(Hierarchy problem)

Matter – anti-matter  
asymmetry? (CP violation)

# The way ahead

## to understand EWSB and discover the more fundamental theory

Some questions after the Higgs discovery:

- Properties as predicted by SM? Spin, parity, CP violation, couplings? With what precision can we extract them?
- Can we measure couplings to 2nd generation fermions (muon, c quark)?
- Can we reconstruct the Higgs potential? Can we measure Higgs self coupling, i.e. di-Higgs production?
- Does the Higgs boson regularize the VV scattering fully? Do other processes beyond the SM contribute?
- Is the new boson alone? Can we discover its (neutral and/or charged) partners?
- Is it a fundamental scalar or a composite particle?
- What stabilizes the Higgs mass against radiative corrections? SUSY? ED? Something else?
- Does the Higgs open a window to new physics?

The program:

- 1) Measure precisely the properties of the Higgs boson
- 2) Look for additional Higgs bosons
- 3) Study massive EW vector boson scattering and triple gauge boson production
  - measure Quartic Gauge Couplings / test the SM gauge structure
  - sensitive to the scalar sector / EWSB model
- 4) Look directly for new phenomena  
(SUSY, new gauge bosons  $W'/Z'$ , extra dimensions... and the unexpected!)

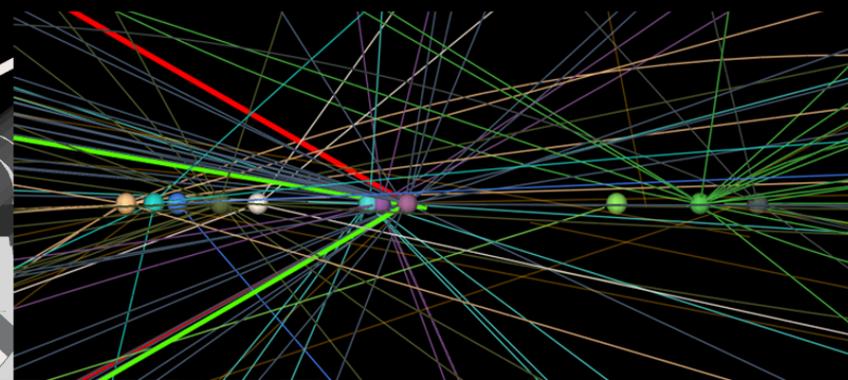

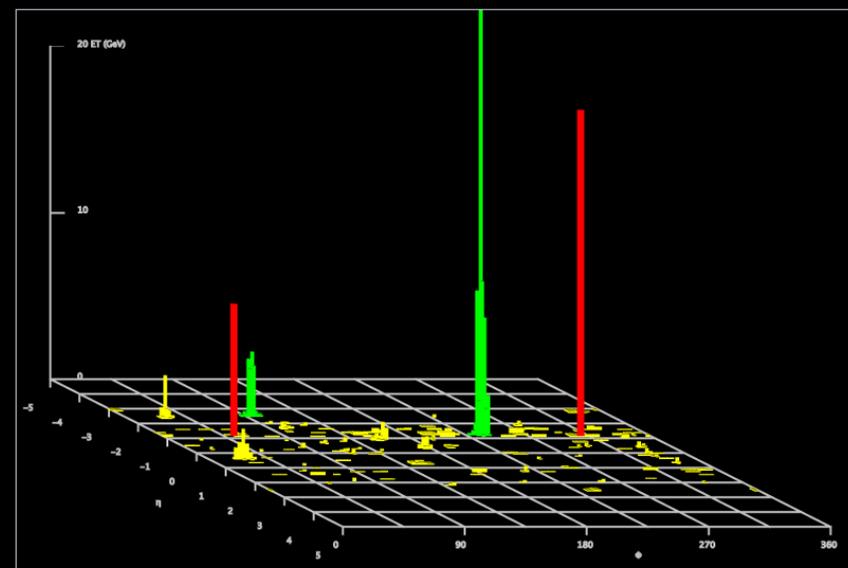

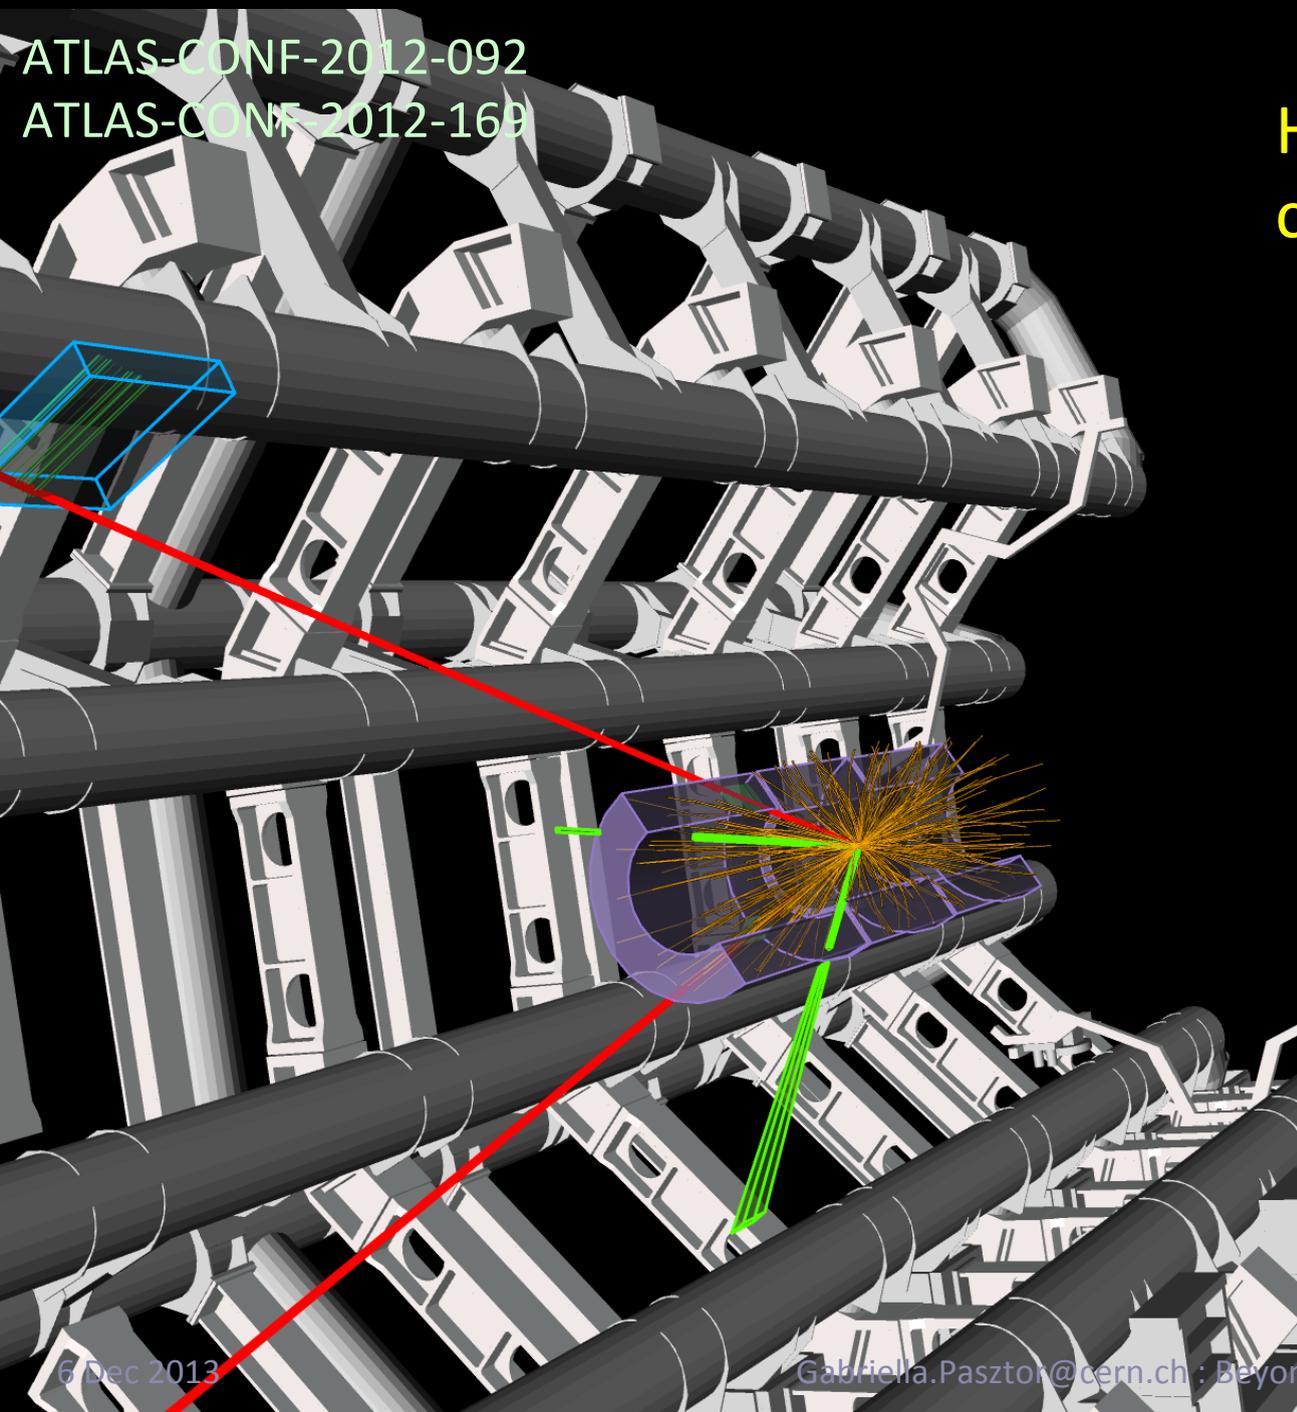

# Higgs property measurements

ATLAS-CONF-2012-092  
ATLAS-CONF-2012-169

$H \rightarrow ZZ^* \rightarrow ee \mu\mu$   
candidate

  
ATLAS  
EXPERIMENT  
<http://atlas.ch>

Run: 205113  
Event: 12611816  
Date: 2012-06-18  
Time: 11:07:47 CEST

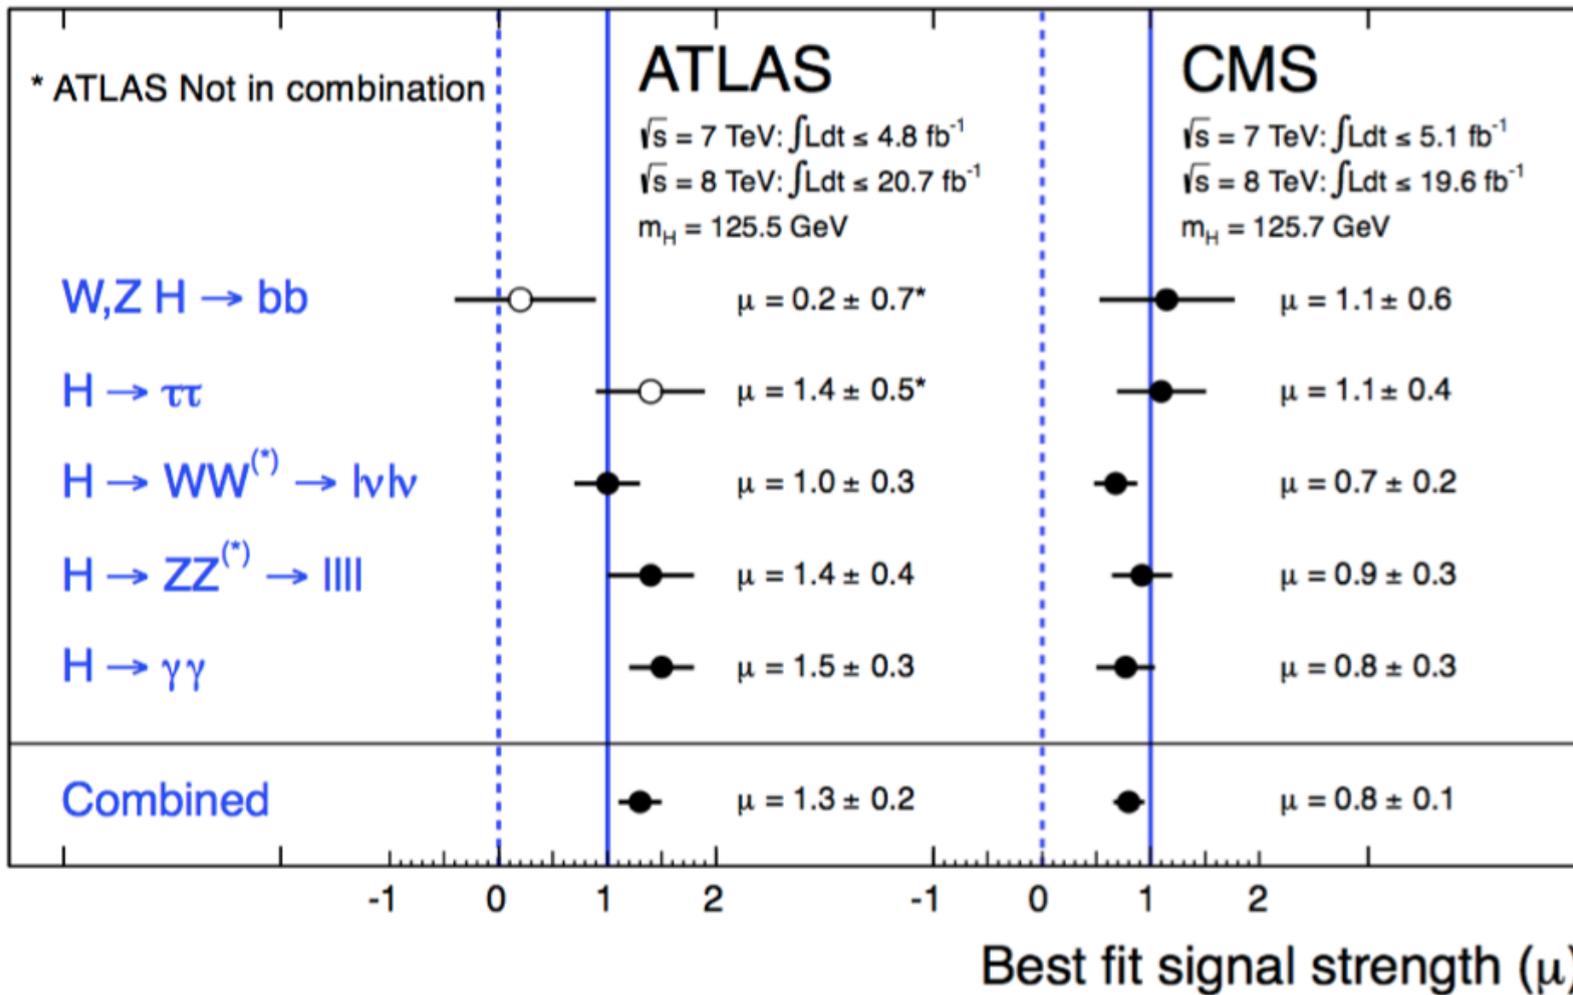

# Higgs production cross-section

$$\mu = \frac{\sigma \cdot BR}{(\sigma \cdot BR)_{SM}}$$

PLB 726 (2013) 88-119

CMS-PAS-HIG-13-005

Tevatron combined  
 (bb,  $\tau\tau$ ,  $\gamma\gamma$ ,  $WW^*$ ):  
 $\mu = 1.44 \pm 0.6$

**Excellent agreement with SM within current precision of 10-20%**

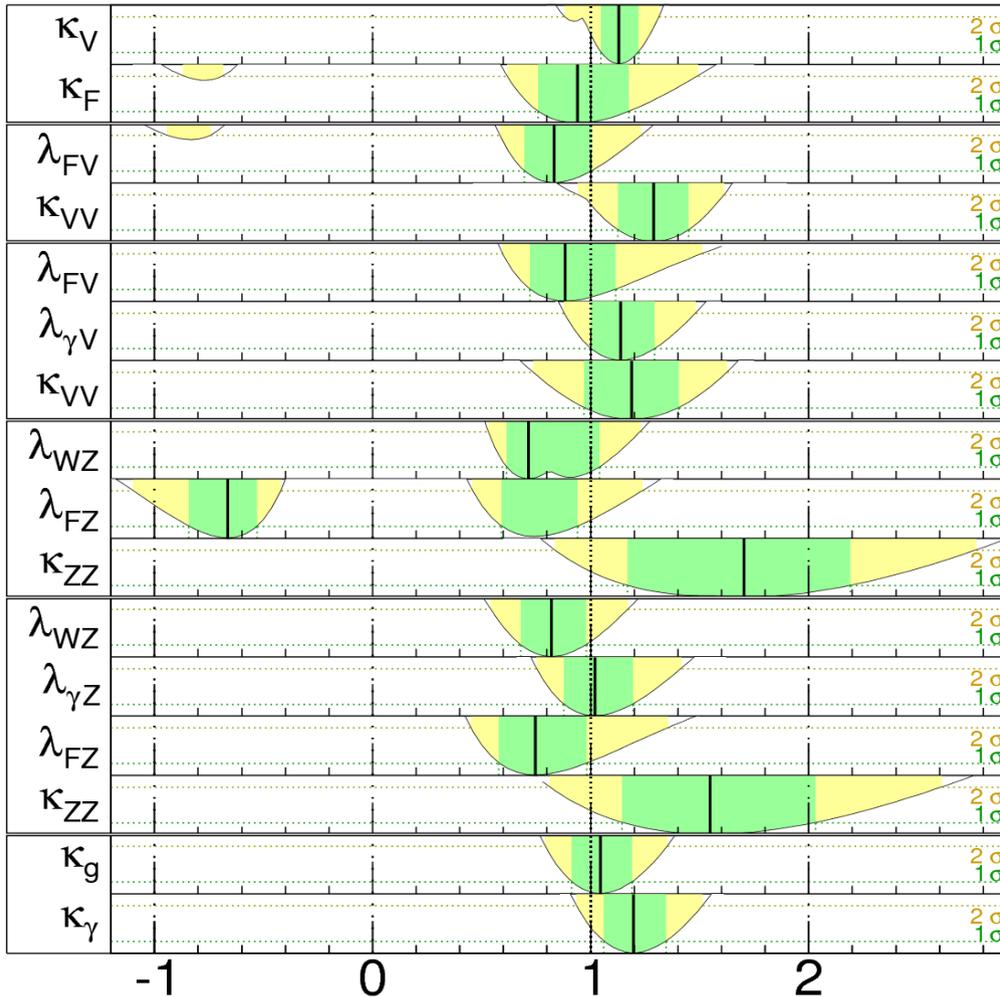

# Coupling constant scale factors

$$\kappa_i \equiv g_i / g_i^{\text{SM}}$$

Measuring different production and decay channels....

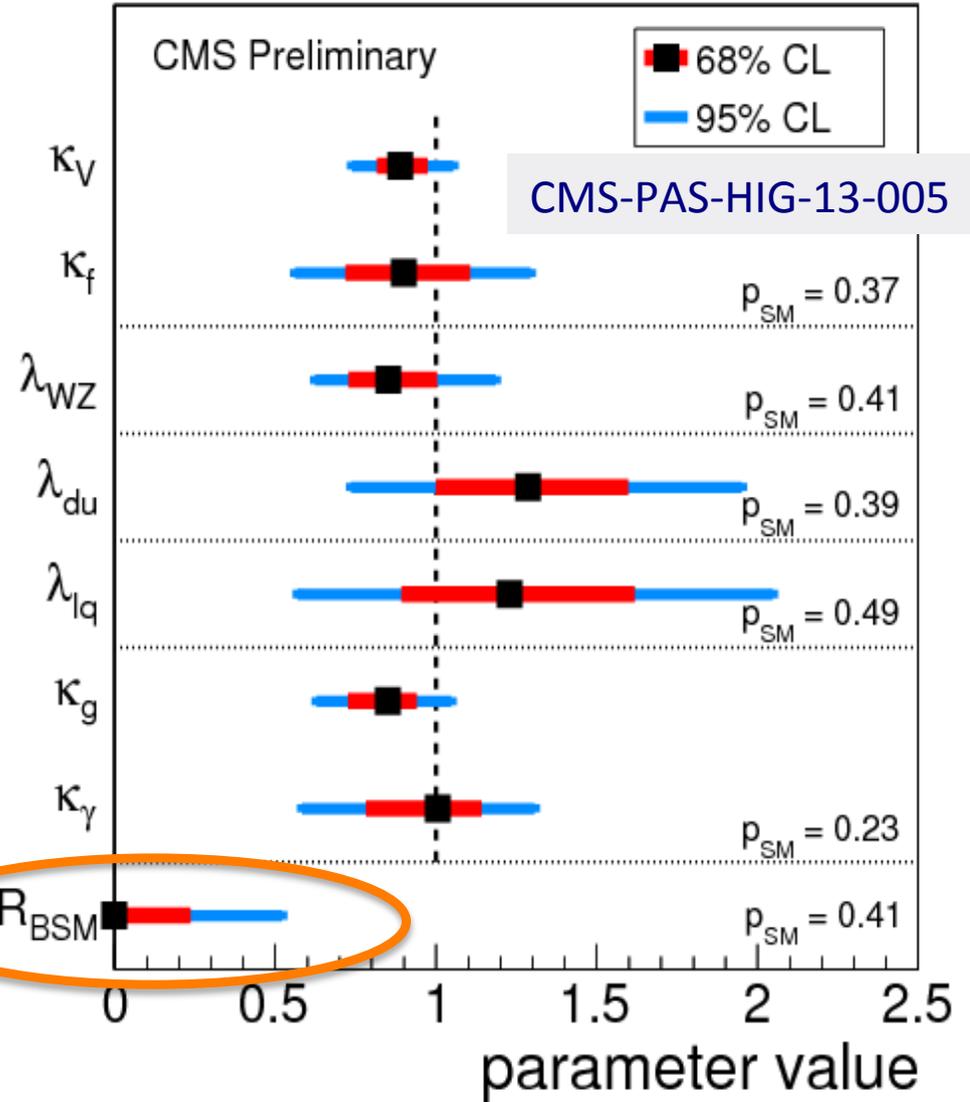

$m_H = 125.5 \text{ GeV}$

$\pm 1\sigma$   $\pm 2\sigma$

PLB 726 (2013) 88-119

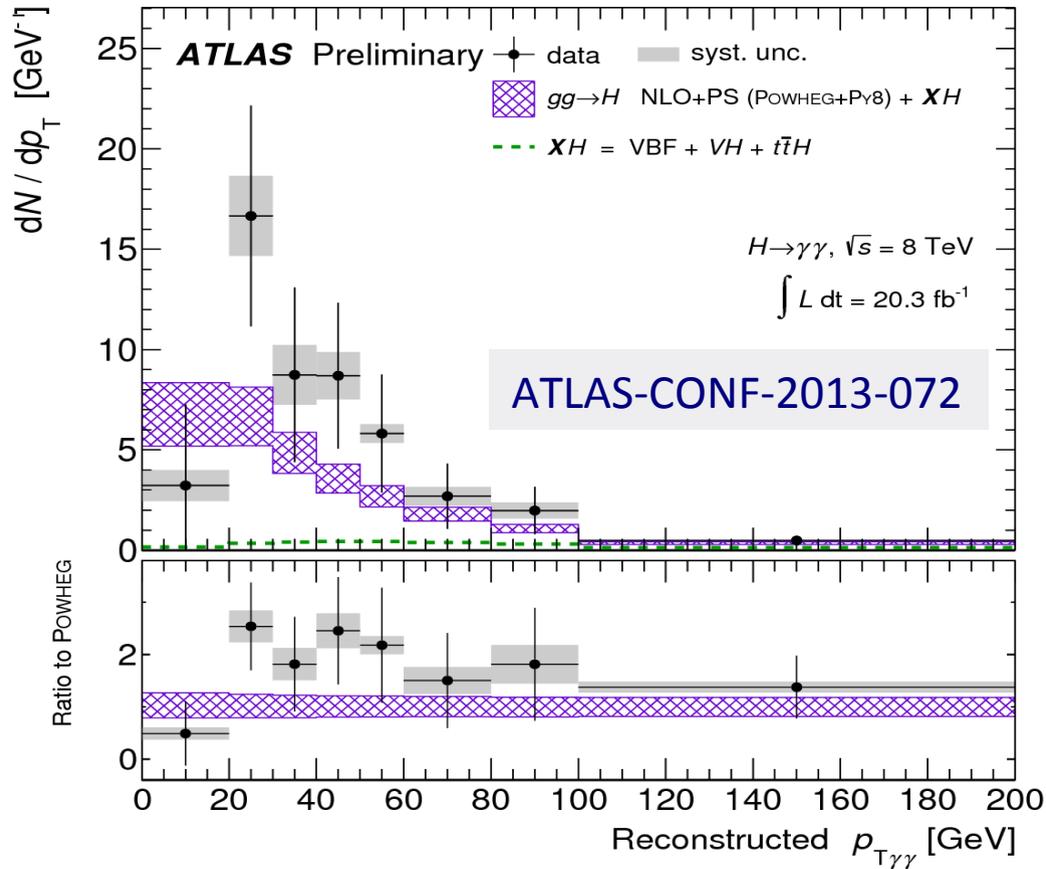

$\sqrt{s} = 7 \text{ TeV}, L \leq 5.1 \text{ fb}^{-1}$   $\sqrt{s} = 8 \text{ TeV}, L \leq 19.6 \text{ fb}^{-1}$

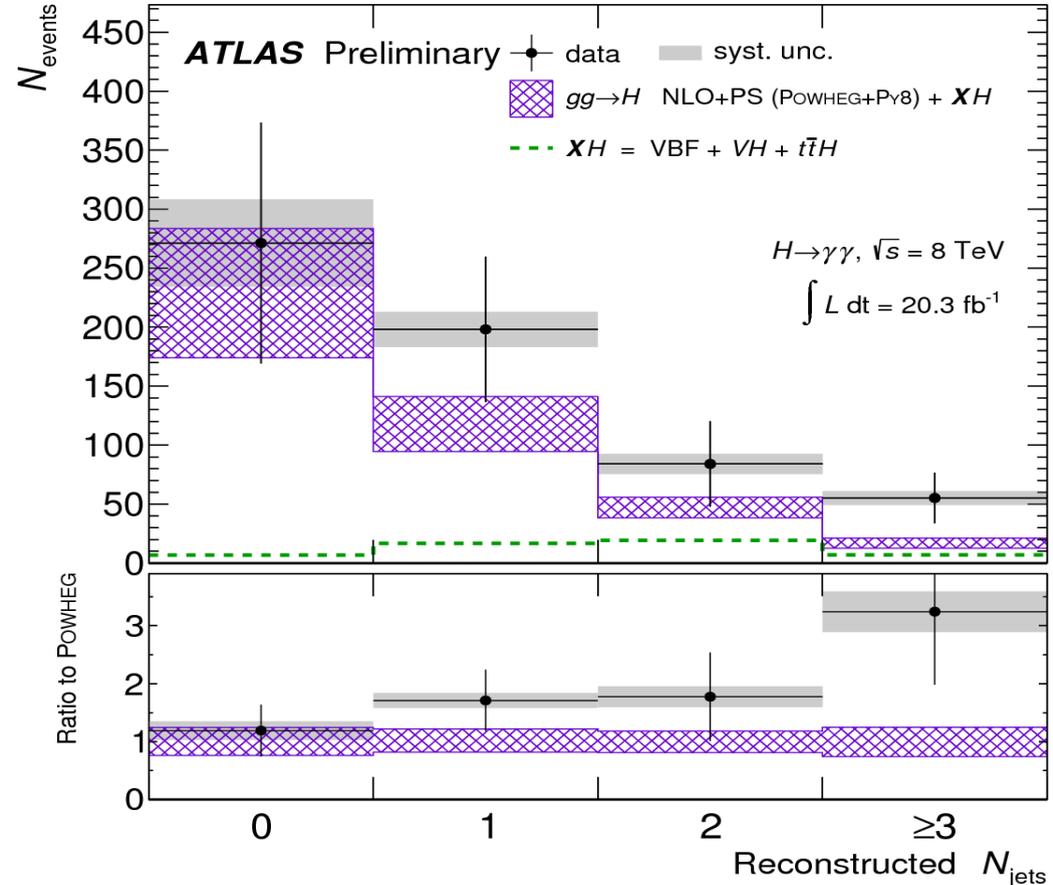

**There is still place for new physics, exotic decays!**

# Entering the Higgs measurement era: $H \rightarrow \gamma\gamma$ differential cross-sections

Test perturbative QCD calculations for the dominant ggH process

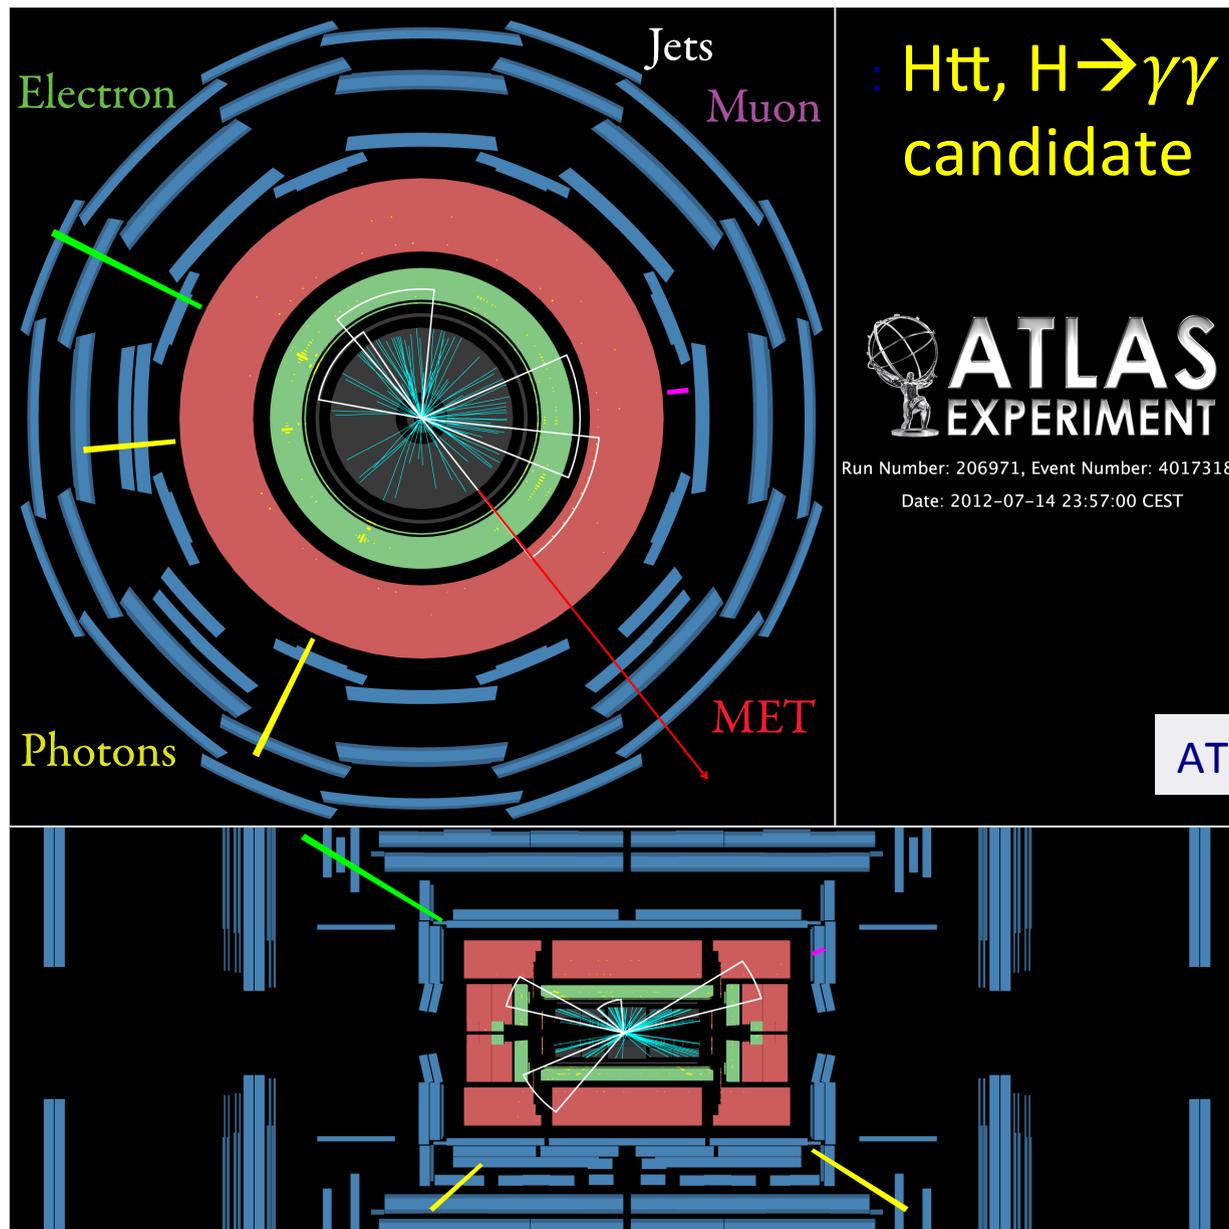

Sensitive to relative rate of production via different mechanisms

**Reduced model dependence!**

If the BSM model has non-SM like tensor structure, i.e. predicts different detector acceptances, selection efficiencies, fiducial cross-sections unfolded to particle level provide a better source of information

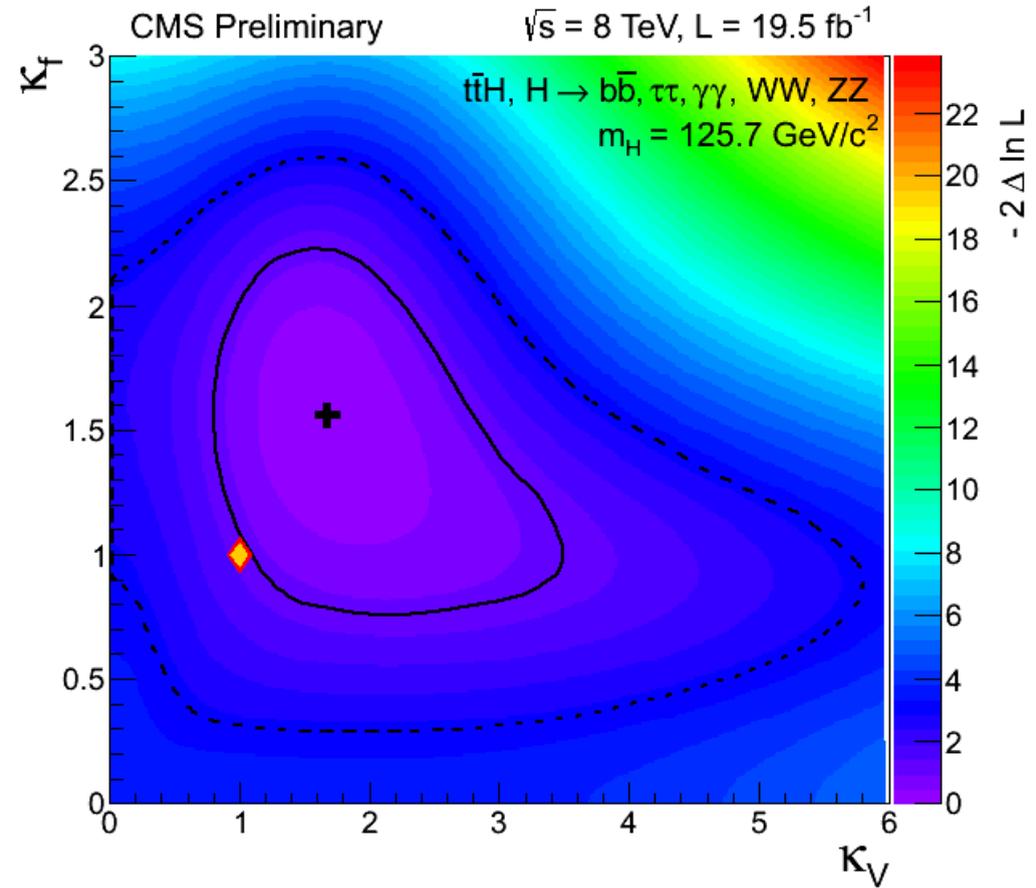

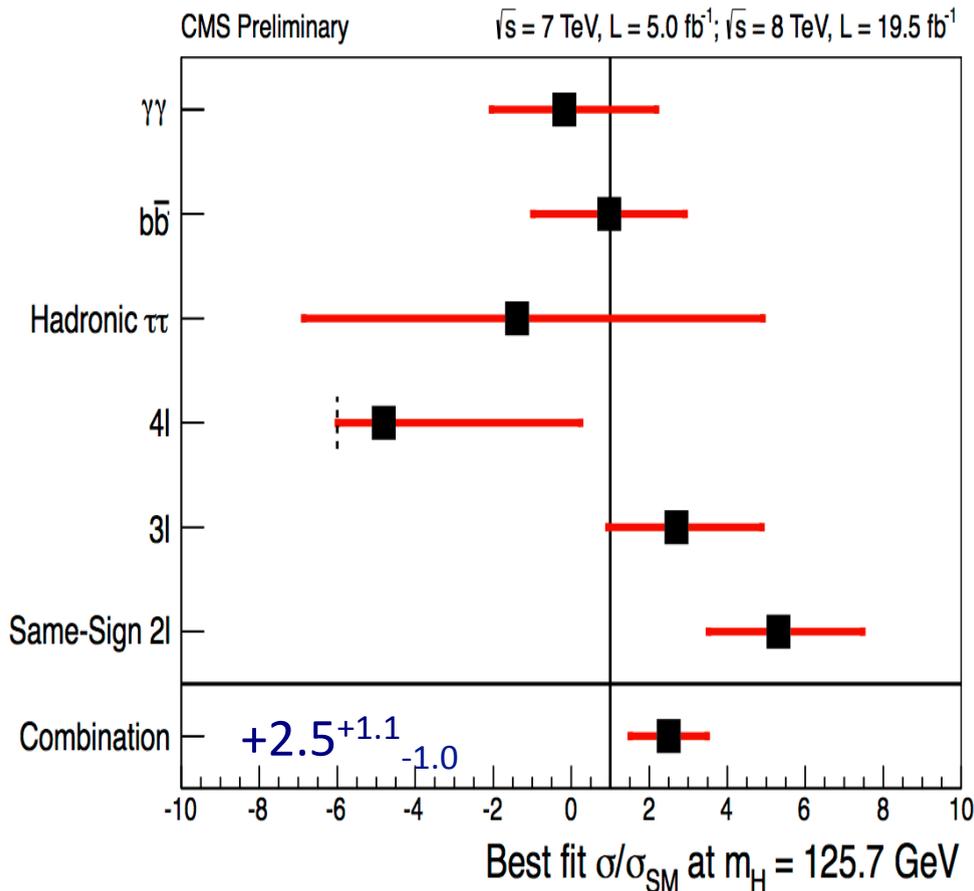

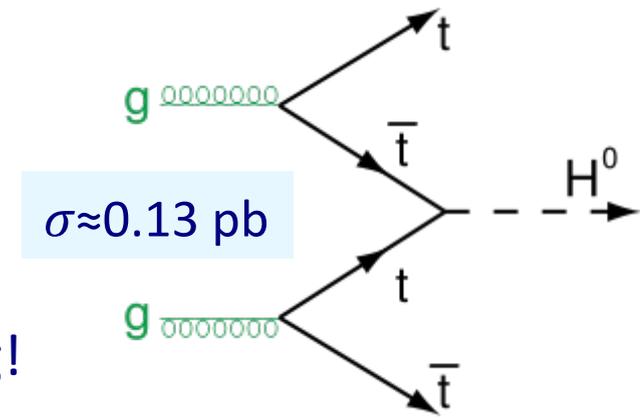

# Measuring rare processes

# Search for ttH production

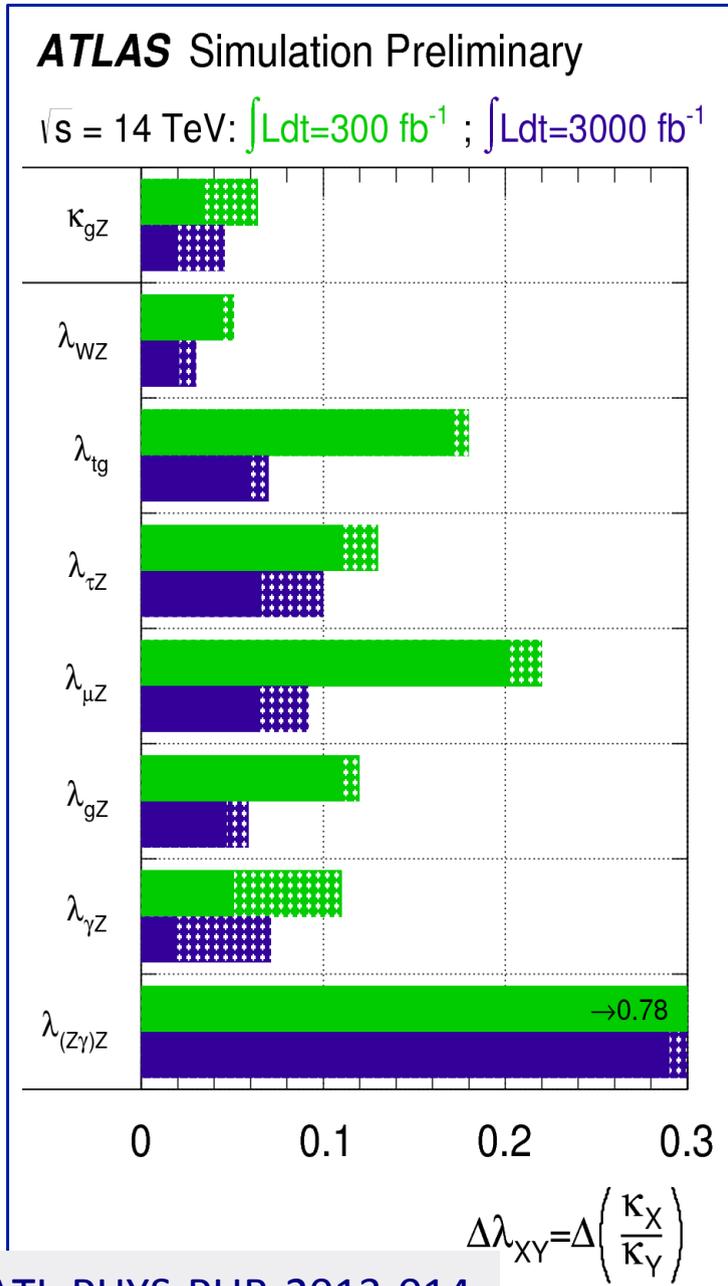

Direct access to Htt coupling

Large background, small cross-section → very challenging!

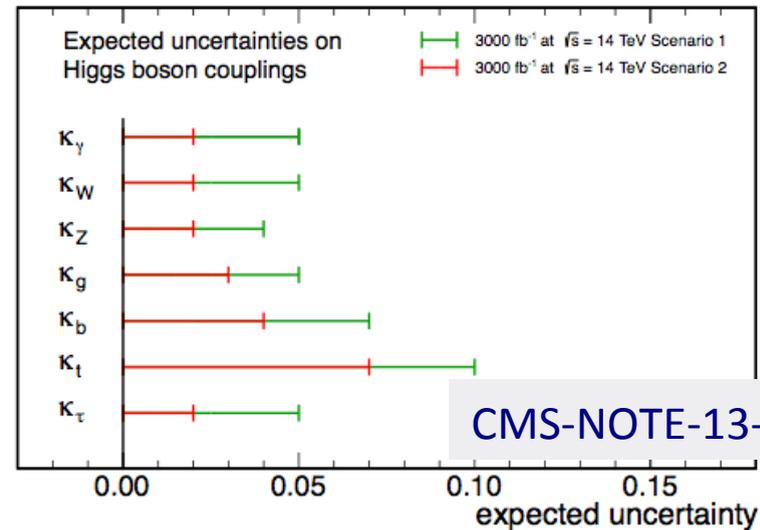

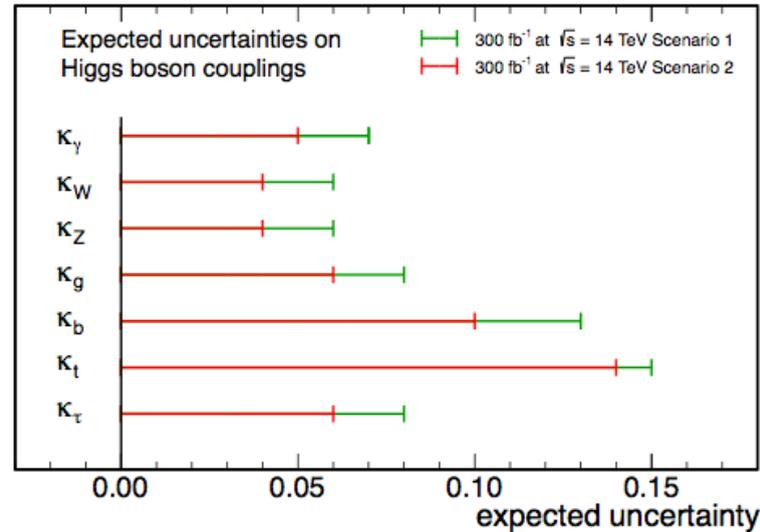

<https://twiki.cern.ch/twiki/bin/view/CMSPublic/ttHCombinationTWiki>

# Projections for Run 2 and HL-LHC ( $E_{cm}=14$ TeV)

CMS Projection

CMS-NOTE-13-002

Most difficult task:  
Measurement of  
Higgs self-interaction  
CMS+ATLAS  
combined: ~30%

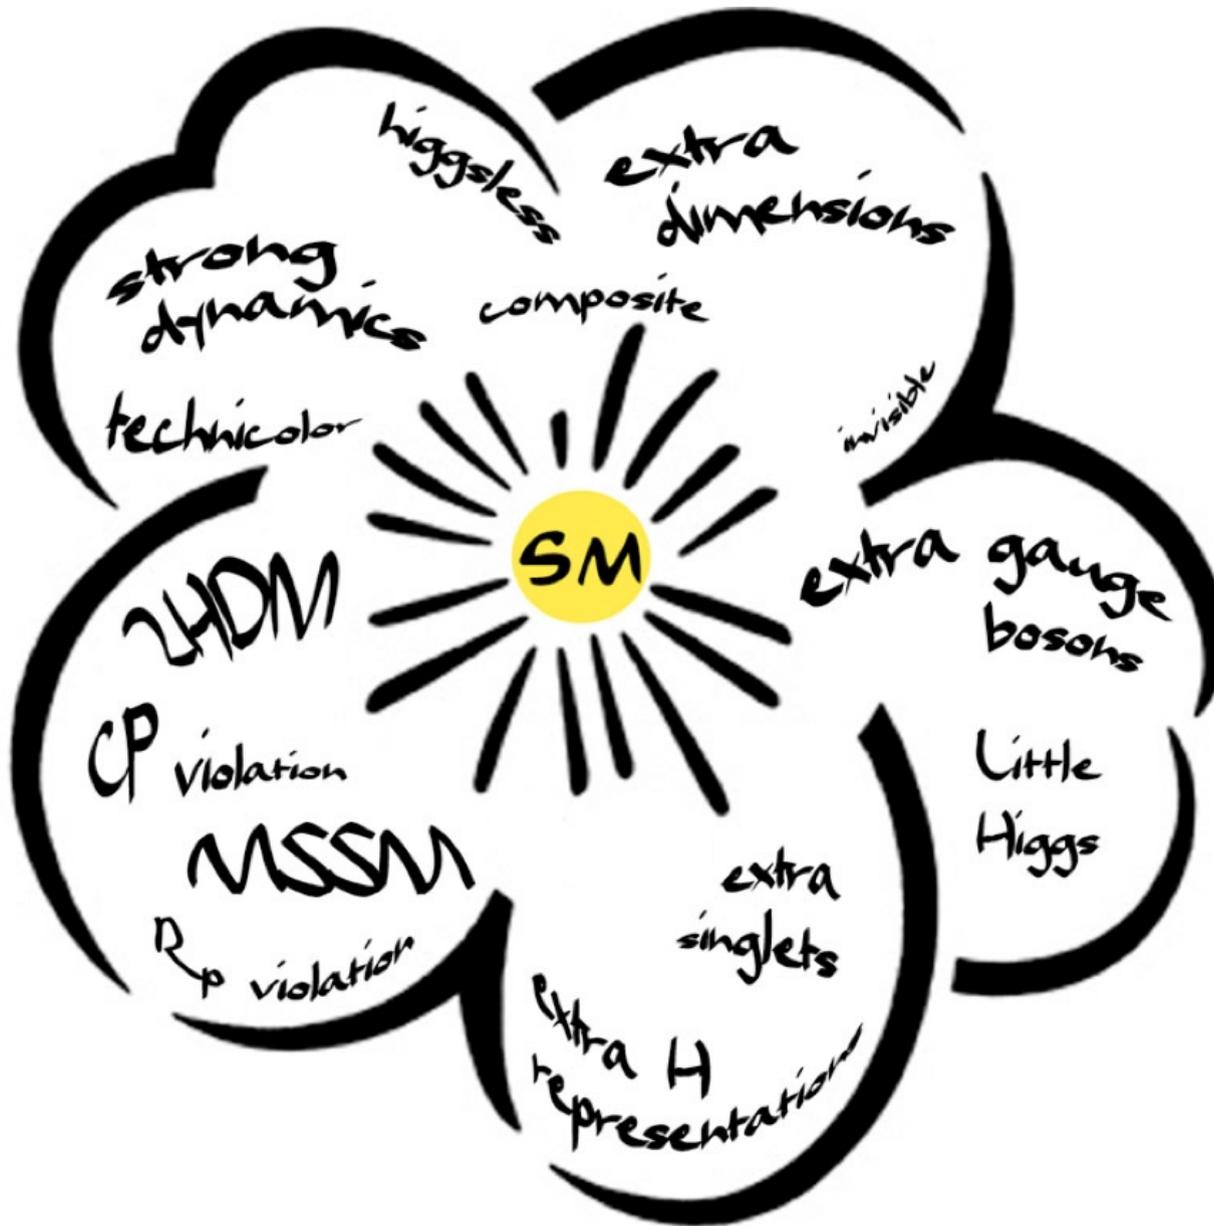

- Theory „requires”  
<20% typically  
to see SUSY  
contributions

arXiv:1305.6397v2 [hep-ph]

CMS scenario 1: syst uncertainties as in Run1

scenario 2: etheory syst x 0,5; experimental  $\sim 1/\sqrt{L}$

# Going beyond...

# Extended Higgs sector

## Standard Model

1 complex scalar doublet  
1 physical Higgs boson: H

## 2HDM

2 complex scalar doublets  
5 physical Higgs bosons:  $h, H, A, H^+, H^-$

## MSSM (Type-II 2HDM)

2 complex scalar doublets  
5 physical Higgs bosons:  $h, H, A, H^+, H^-$

## NMSSM ( ~~$\mu$ -problem of MSSM~~)

2 complex scalar doublets + 1 singlet  
7 physical Higgs bosons:  
 $h_1, h_2, h_3, a_1, a_2, h^+, h^-$

## Additional SM-like Higgs

( $\rightarrow$  high-mass searches)

## Fermiophobic Higgs

## Invisible Higgs

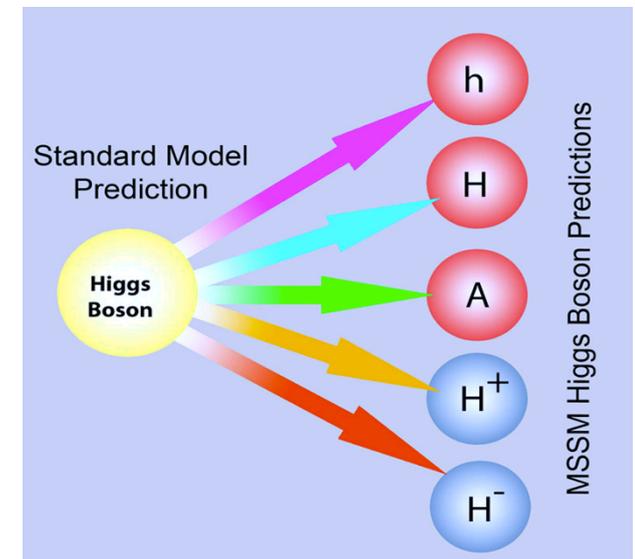

e.g. decaying to neutral LSP

## „Exotic” Higgs

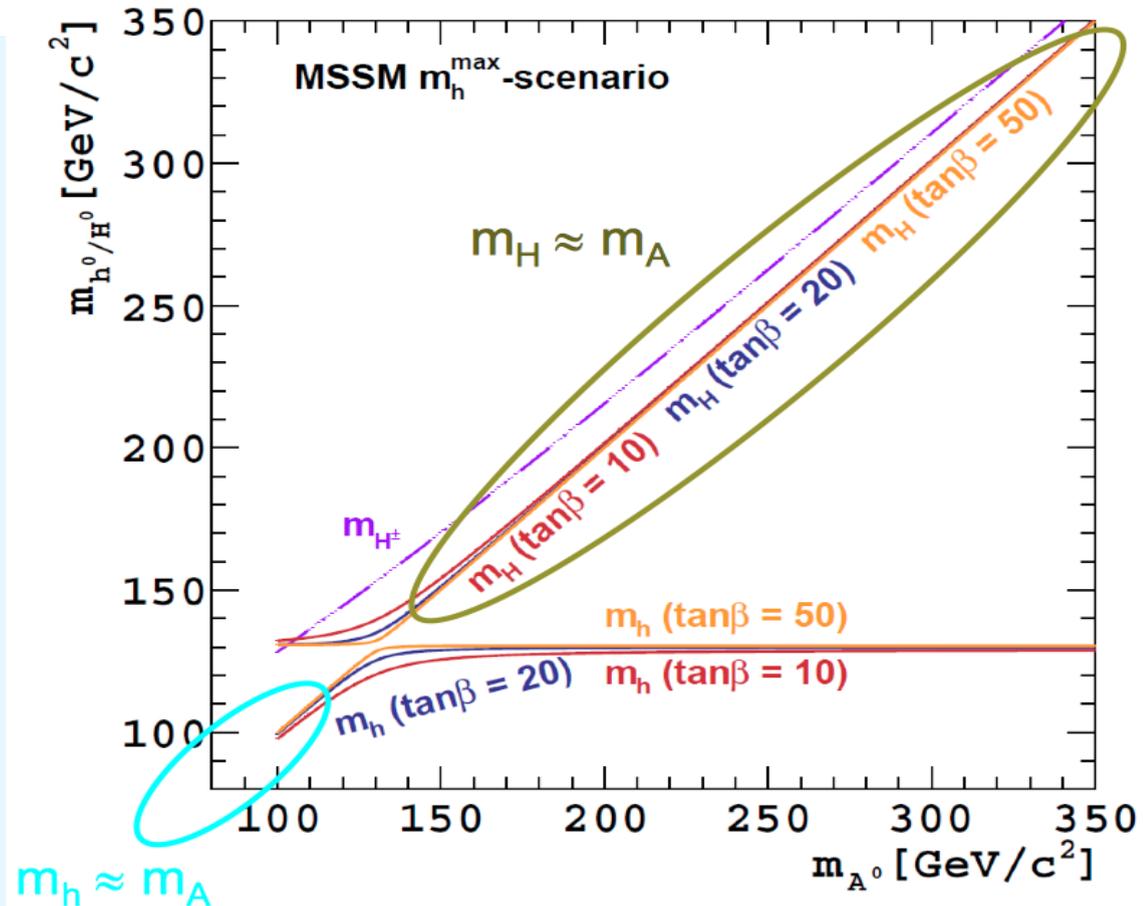

e.g. decaying to lepton-jets in  
hidden-valley SUSY

# MSSM Higgs sector

- 2 complex scalar doublets  $\rightarrow$  5 physical Higgs bosons
- Tree-level parameters:  $m_A$ ,  $\tan\beta$
- Many more parameters after radiative corrections  
 $\rightarrow$  need benchmark scenarios
- Show only  $m_h^{\max}$  in this talk

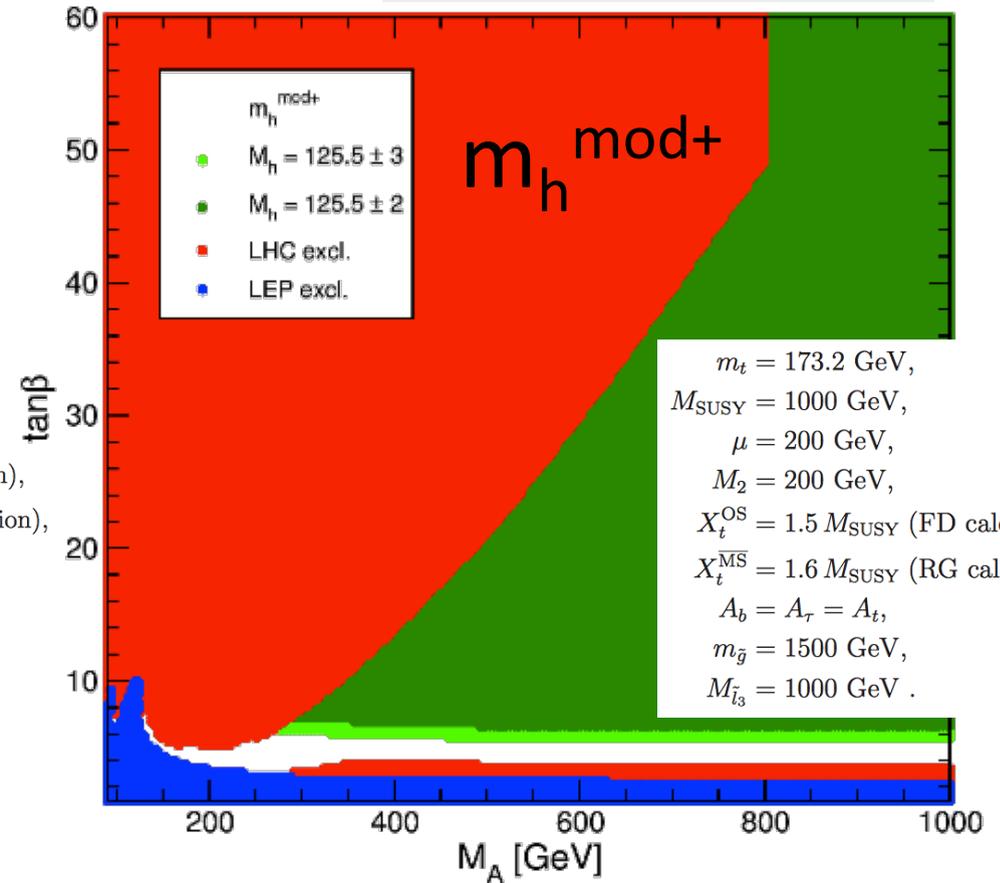

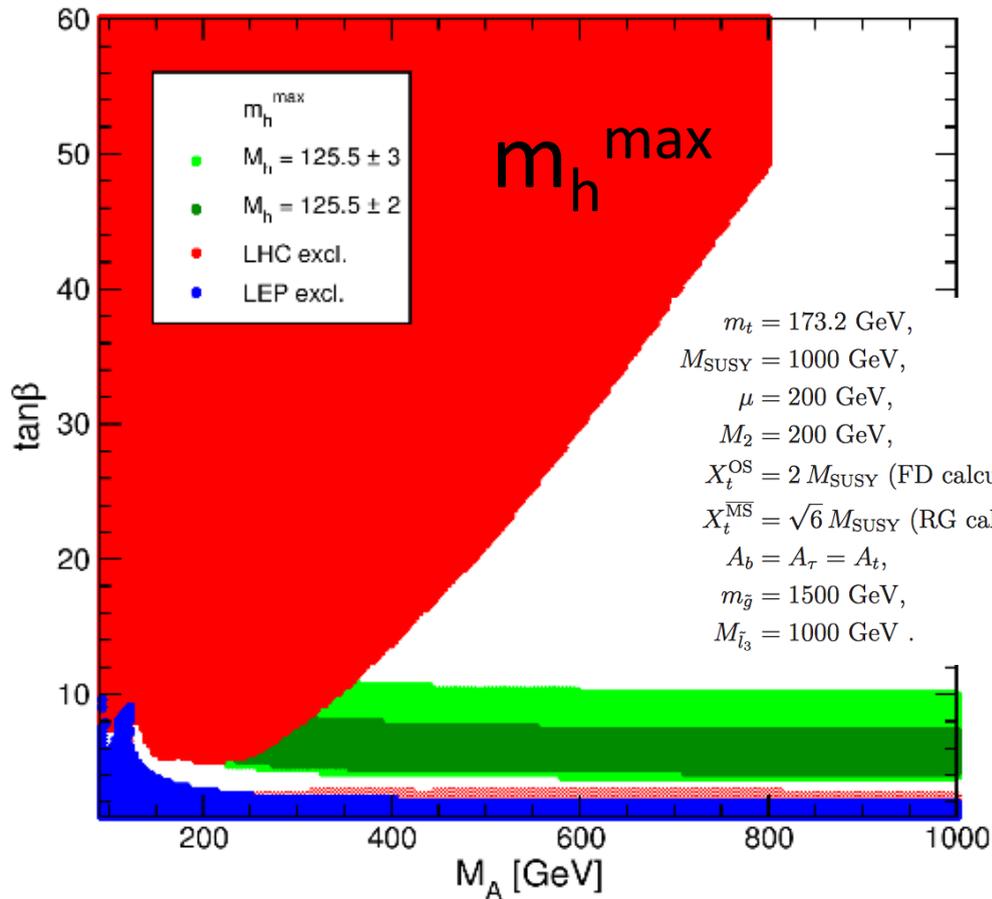

- In MSSM, at large  $m_A$  ( $\gg m_Z$ ),  $h$  usually becomes SM-like (decoupling limit)  
 $\rightarrow$  Direct search for additional Higgs states important!
- Rise of phenomenological-MSSM (pMSSM- $n$ ): general scan of the  $n$  most important parameters (while fixing the less important ones to fit precision data)
- Remember: while general MSSM has 100+ parameters from the soft susy breaking terms of the Lagrangian, relations are expected among them depending on how SUSY is broken)

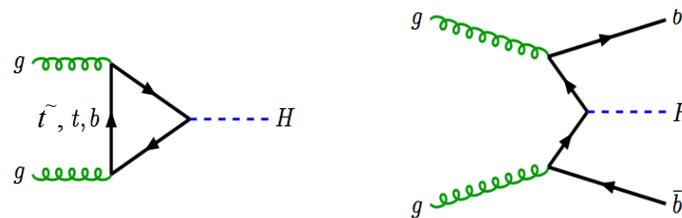

# Consistency with $m_h = 125$ GeV

arXiv:1302.7033 [hep-ph]

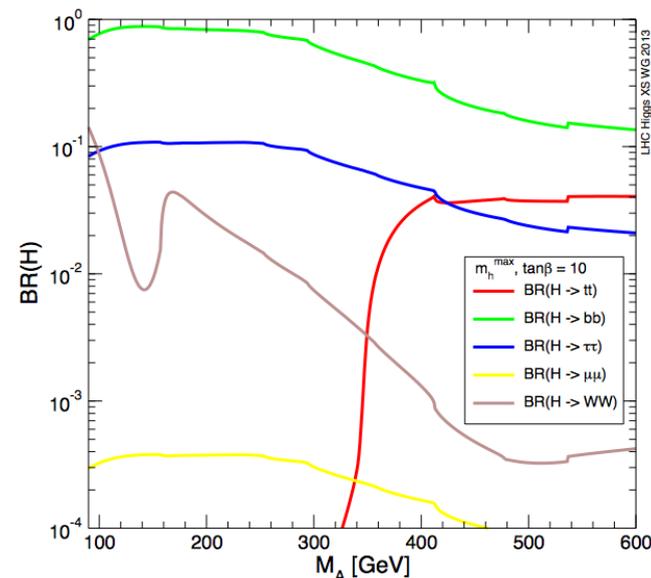

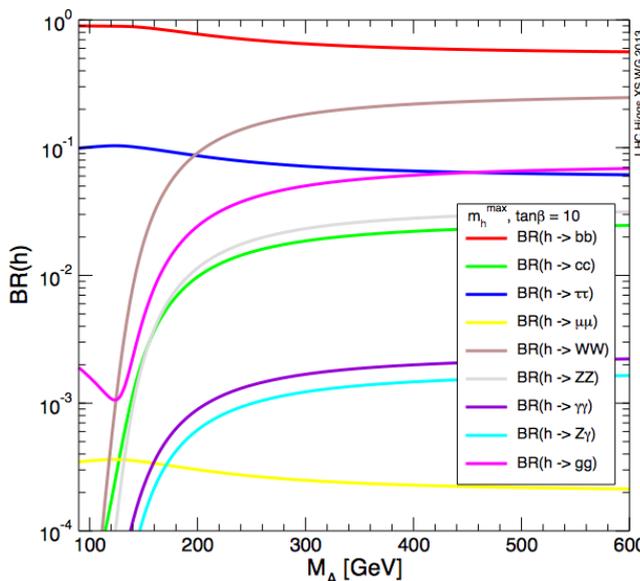

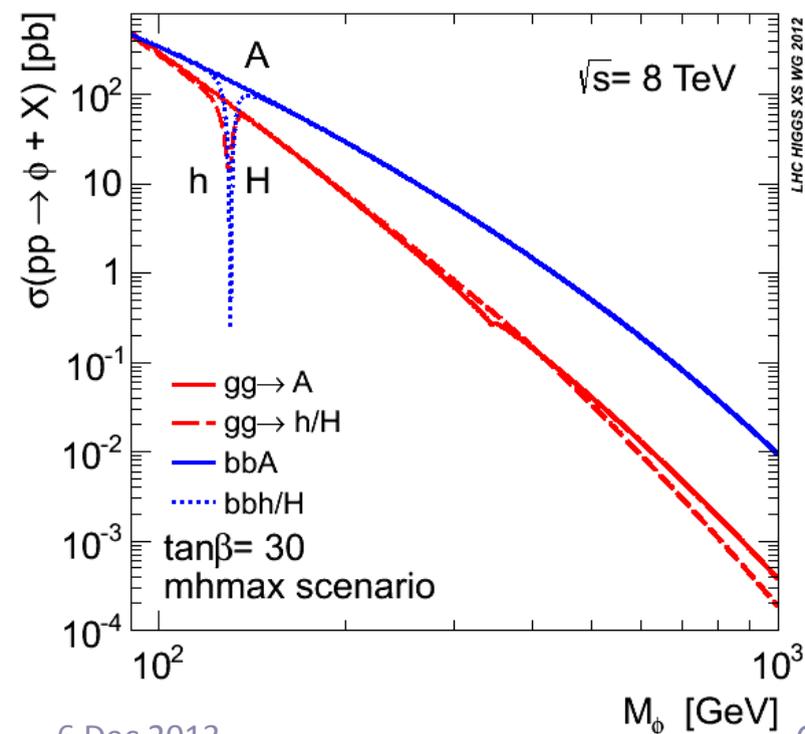

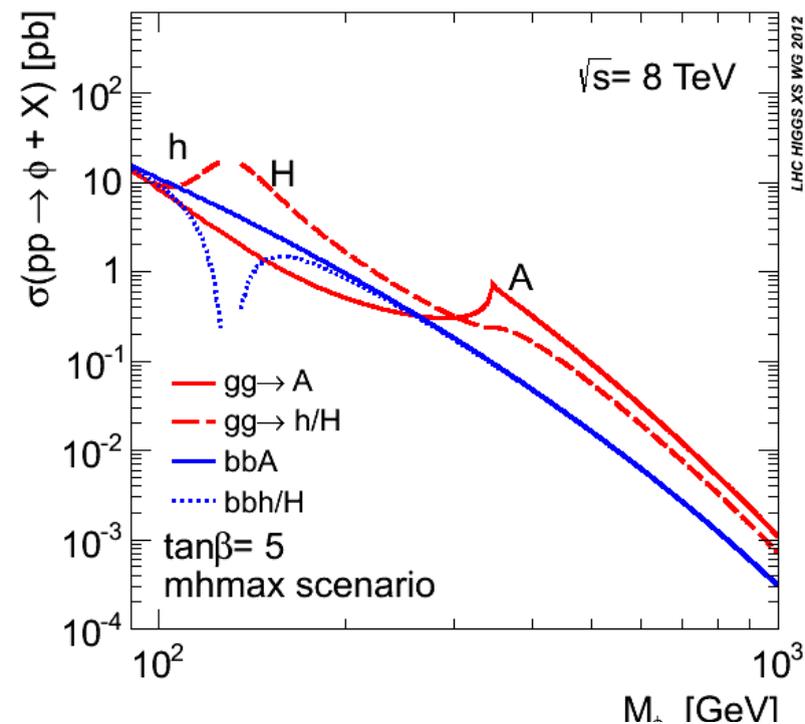

# Production and decay

- Associated  $bb\phi$  production plays an important role

- Strongly enhanced cross-section at high  $\tan\beta$
- Decays  $\phi \rightarrow bb, \tau\tau$  are important also at high mass
- $\phi \rightarrow bb$  very challenging (huge background)
- $\phi \rightarrow \mu\mu$  very low BR but excellent resolution (could separate H / A when degenerate)

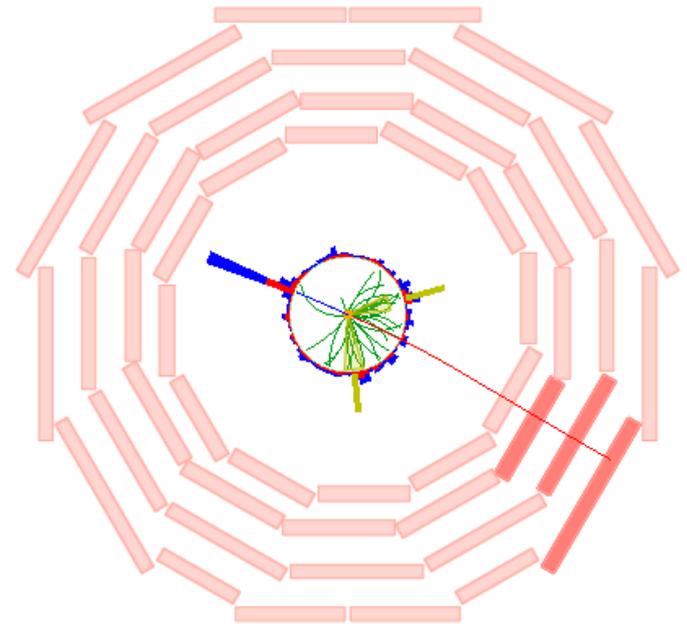

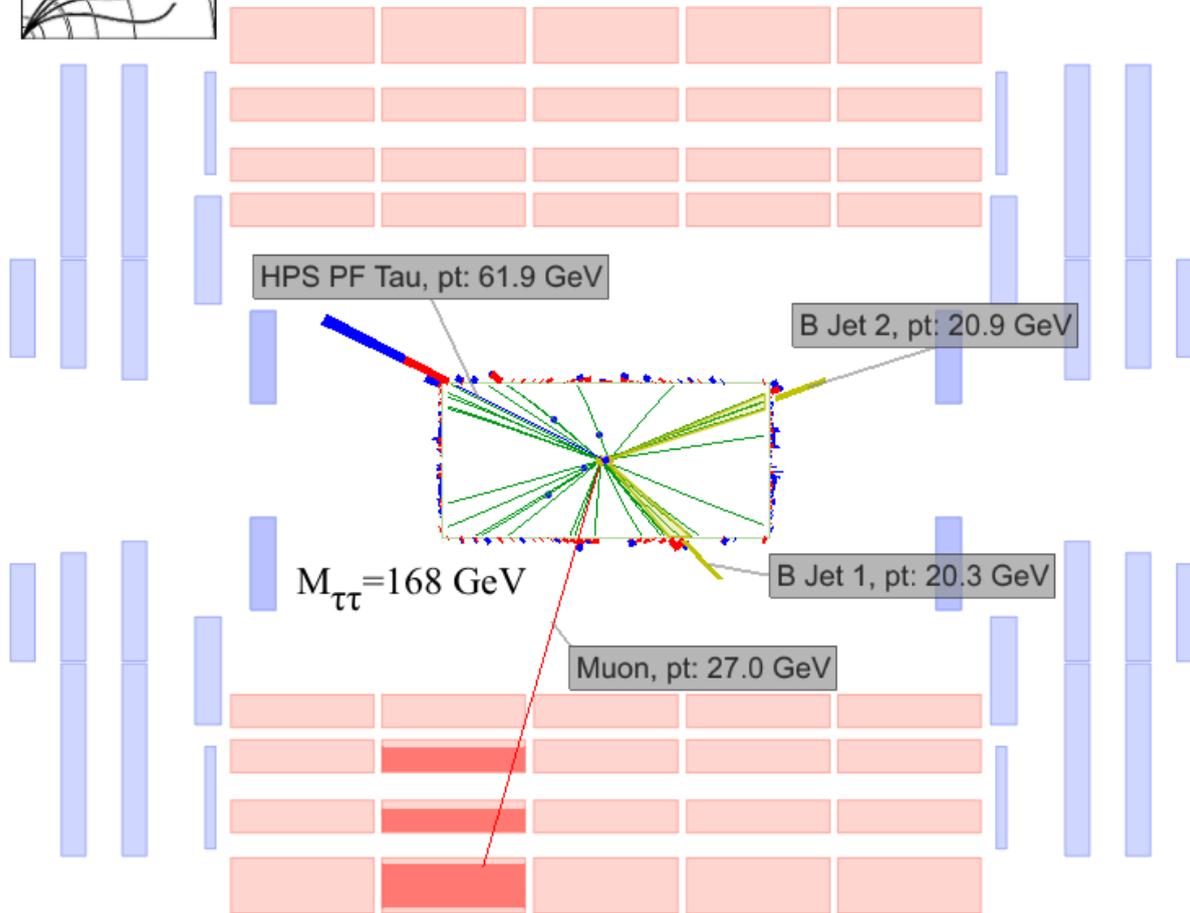

# Search for $bb\phi \rightarrow bb(\tau\tau)$

CMS-PAS-HIG-13-021

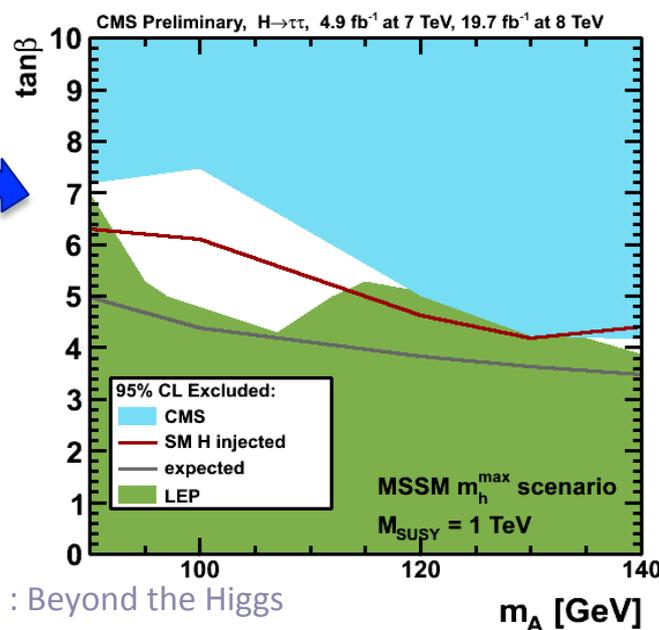

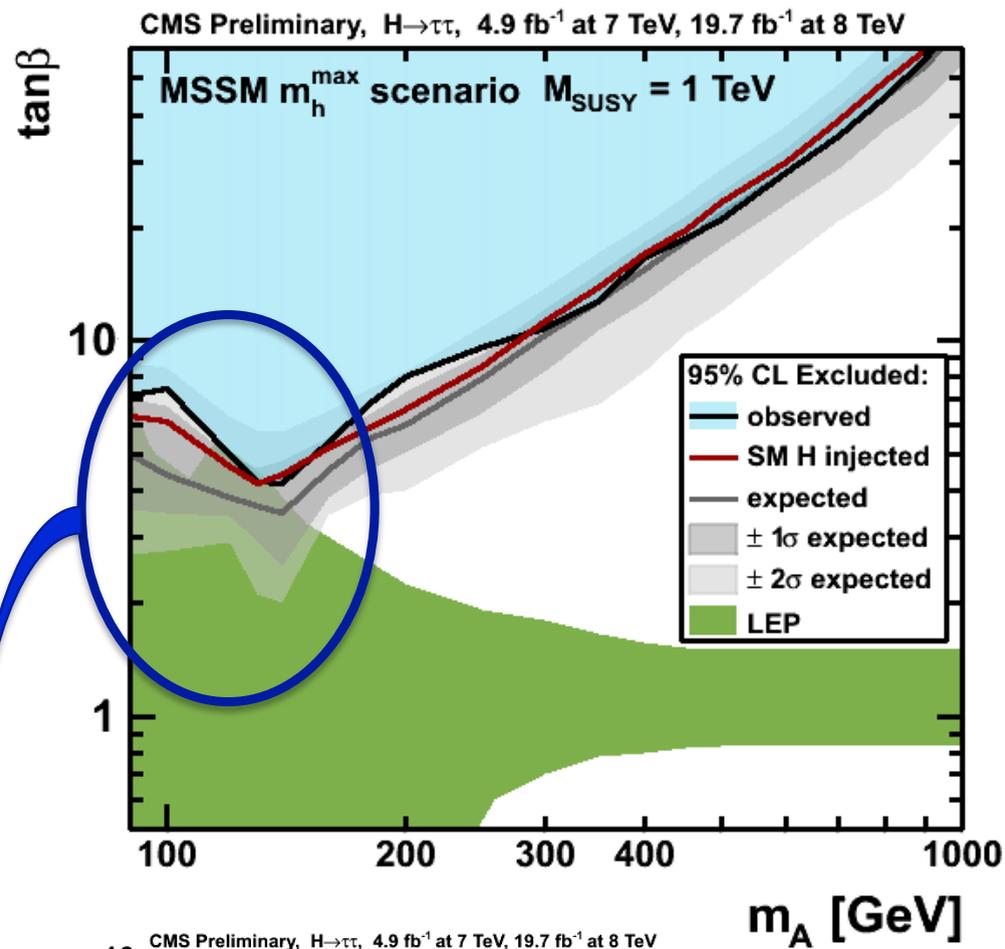

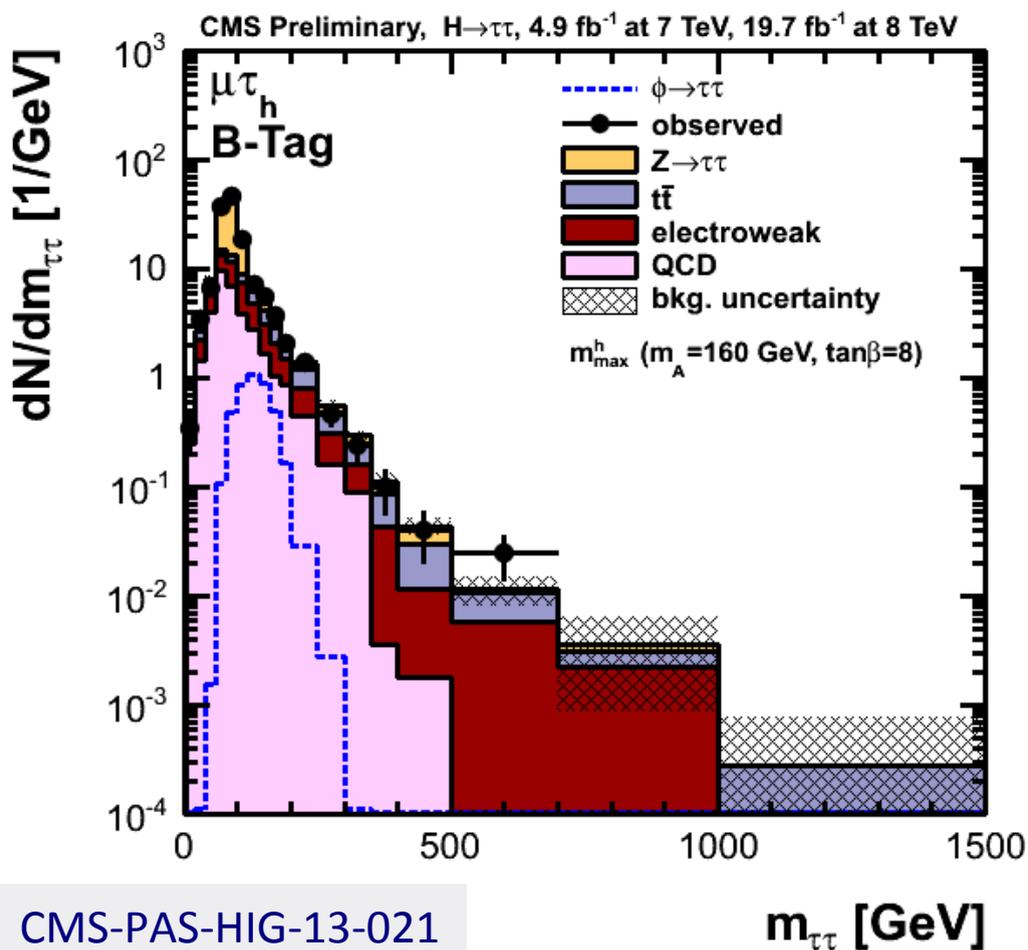

CMS Experiment at LHC, CERN  
Data recorded: Mon Oct 3 03:07:23 2011 CEST  
Run/Event: 177730 / 2113660794

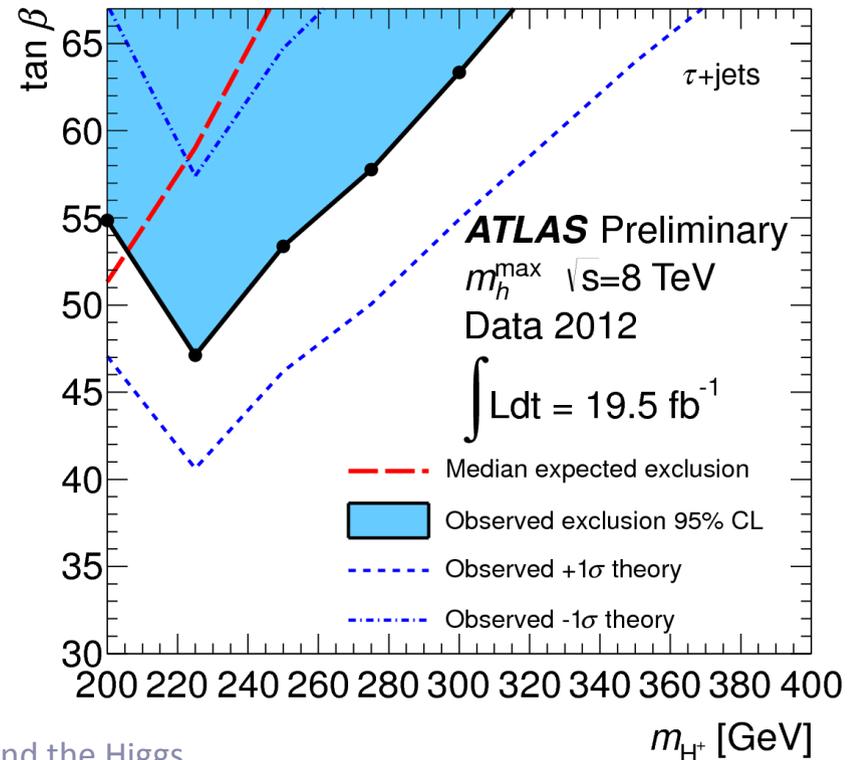

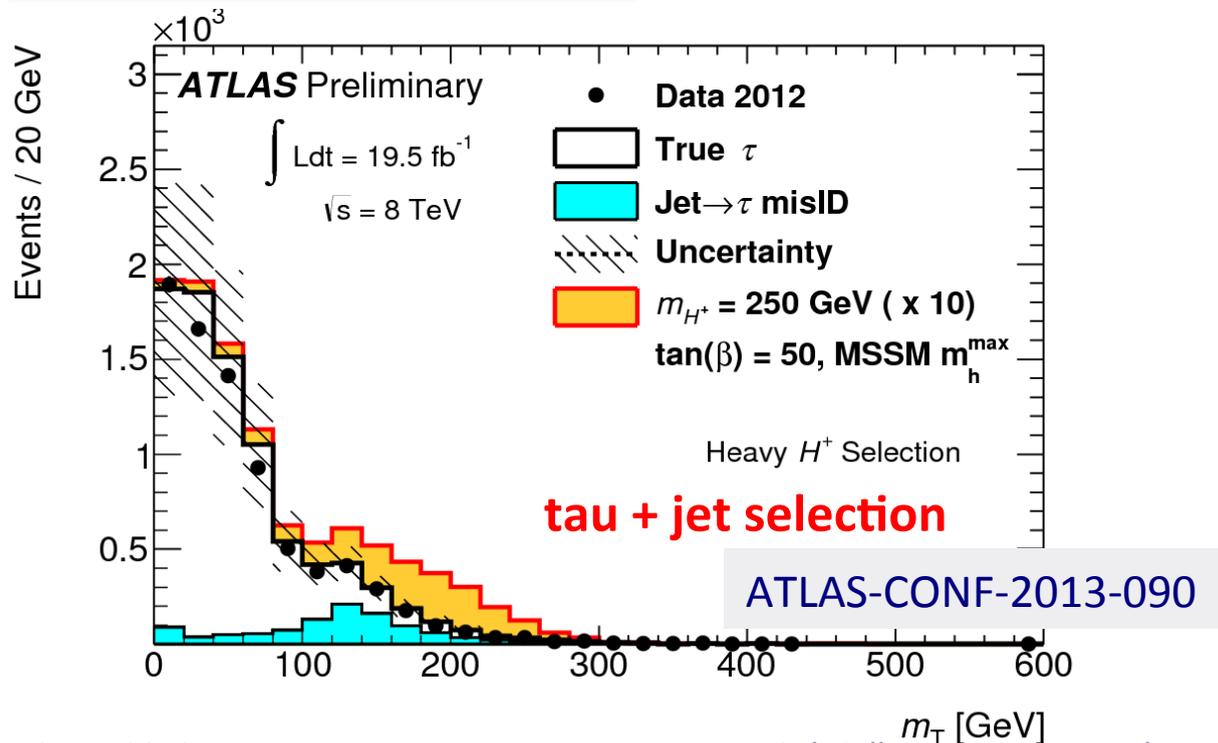

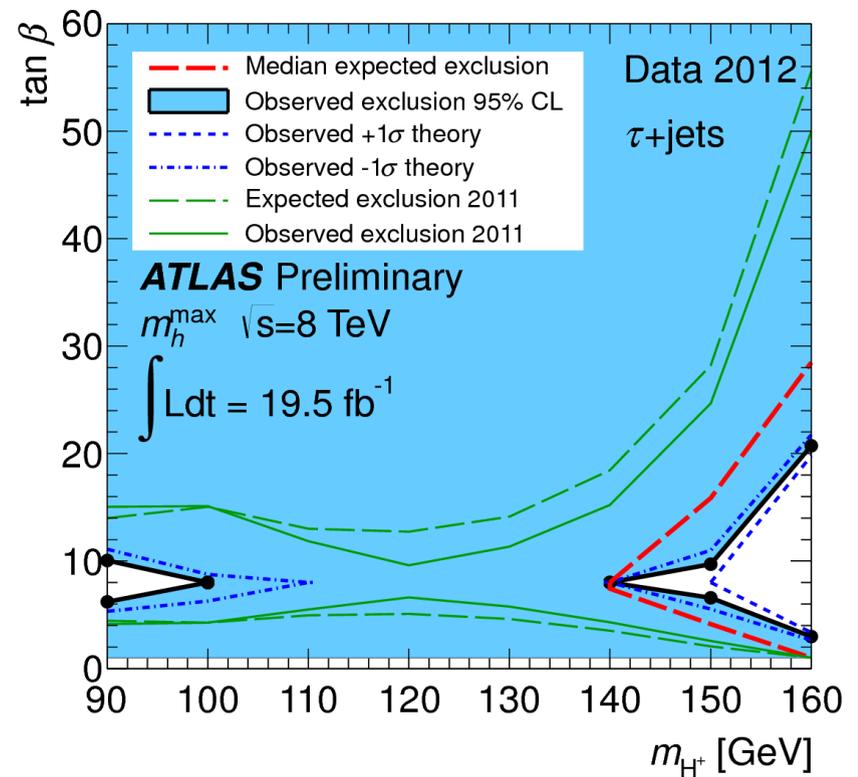

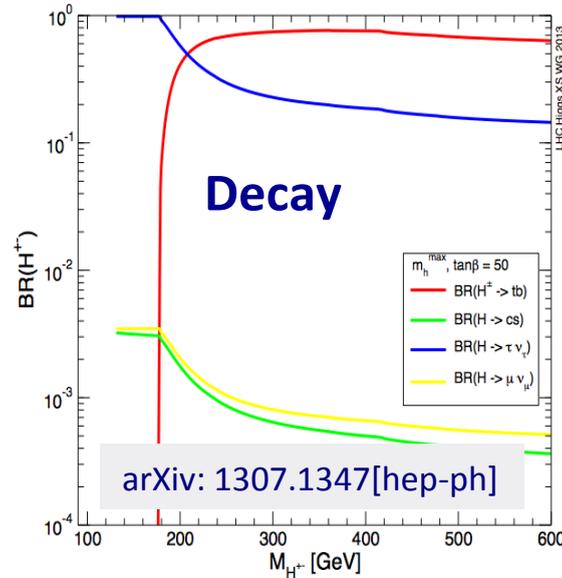

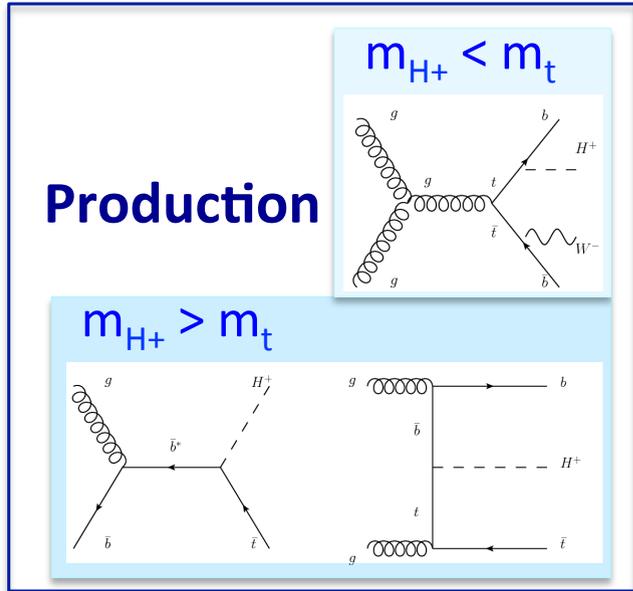

$bb\phi \rightarrow bb(\tau\tau) \rightarrow bb(\text{had } \mu)$  candidate

# Search for $\phi \rightarrow \tau\tau$

Background composition differs significantly from tau final state to tau final state, but all distributions are well described by background only hypothesis

# Search for Charged Higgs

# Searching for exotic Higgs decays

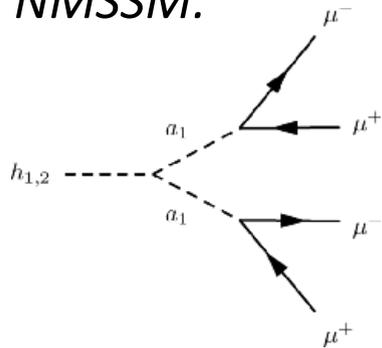

Many „beyond MSSM” extensions, e.g.

- NMSSM (to solve the  $\mu$ -problem of MSSM): 7 physical Higgs bosons:  $h_1, h_2, h_3, a_1, a_2, h^+, h^-$
- Hidden-valley theories with a dark sector (dark-particles can have low mass!)

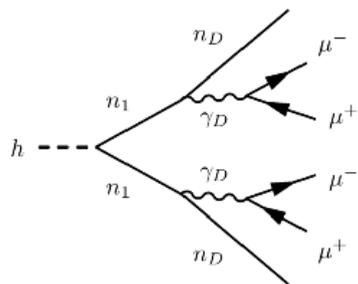

Exotic decay modes open, e.g.

$$h \rightarrow 2a + X \rightarrow 4\mu + X$$

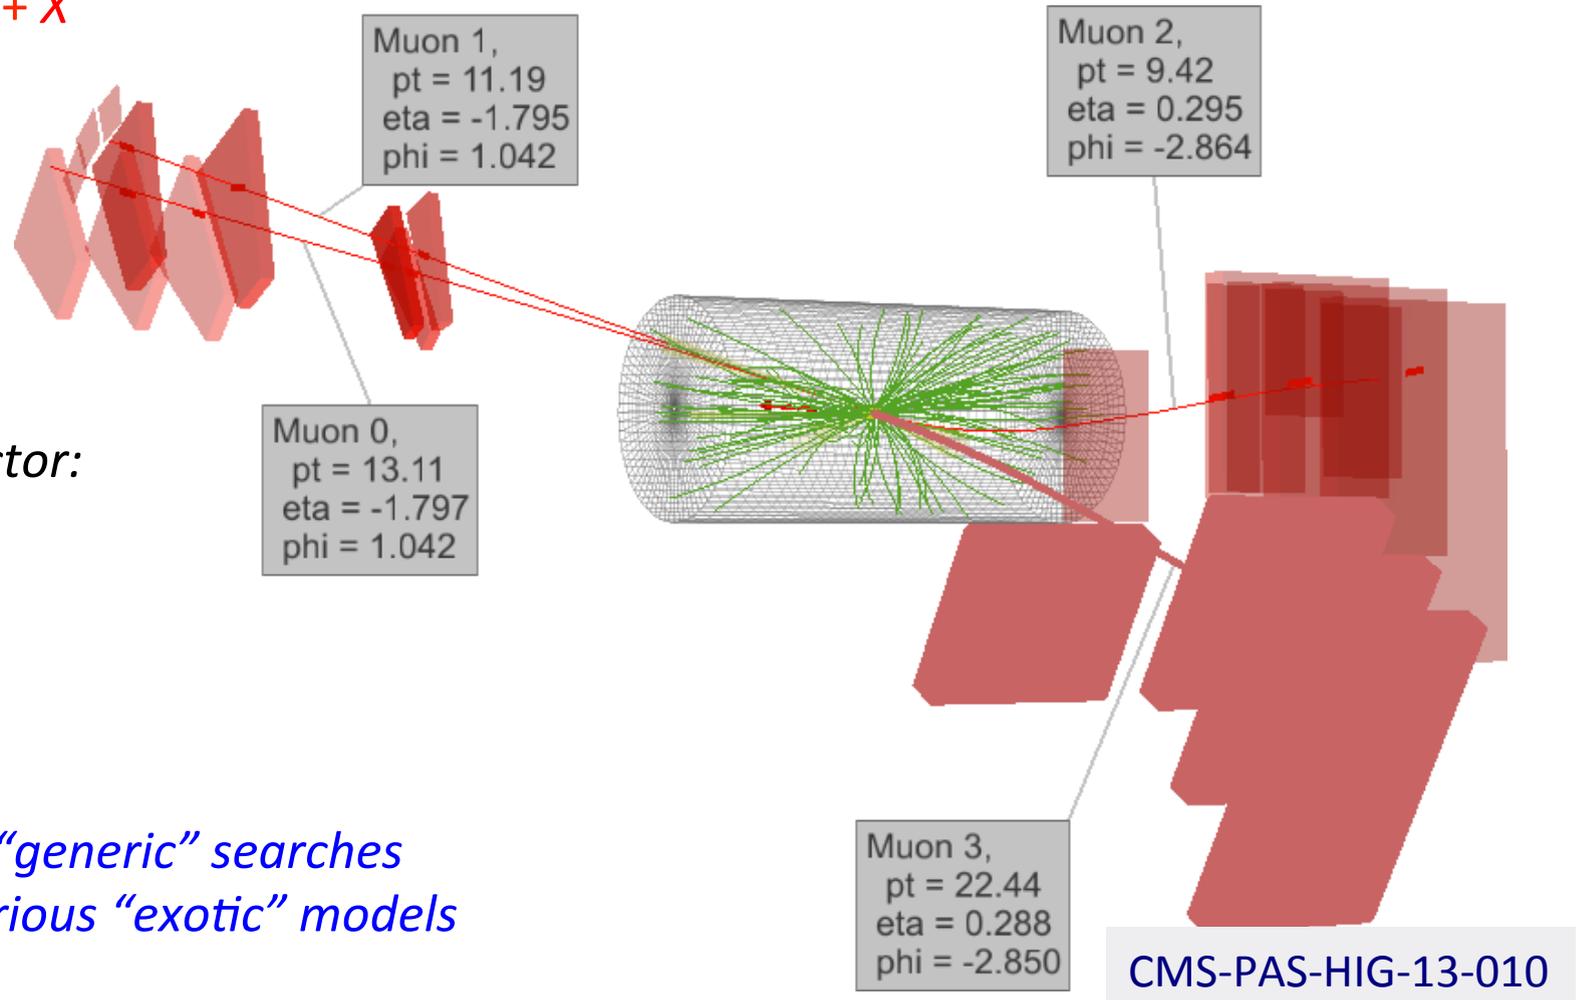

NMSSM:

SUSY with a dark sector:

→ Topology-based, “generic” searches interpreted in various “exotic” models

# Search for $h \rightarrow 2a + X \rightarrow 4\mu + X$ at low $m_a$

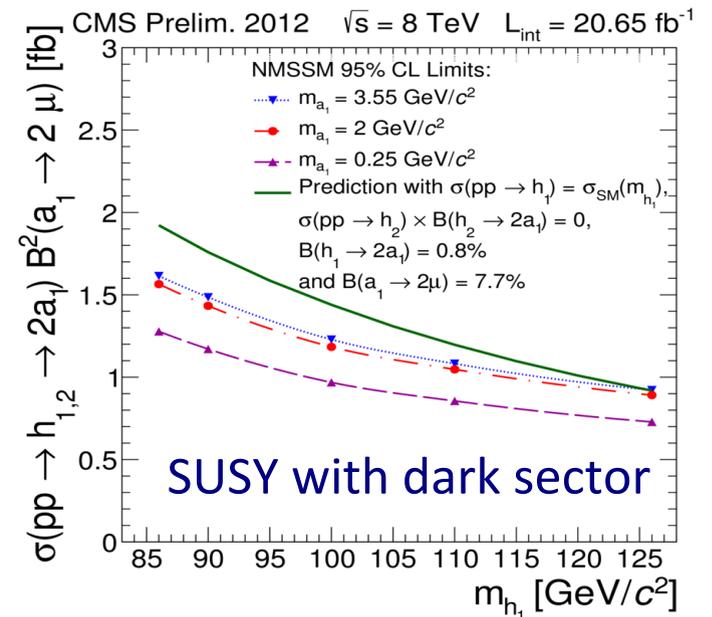

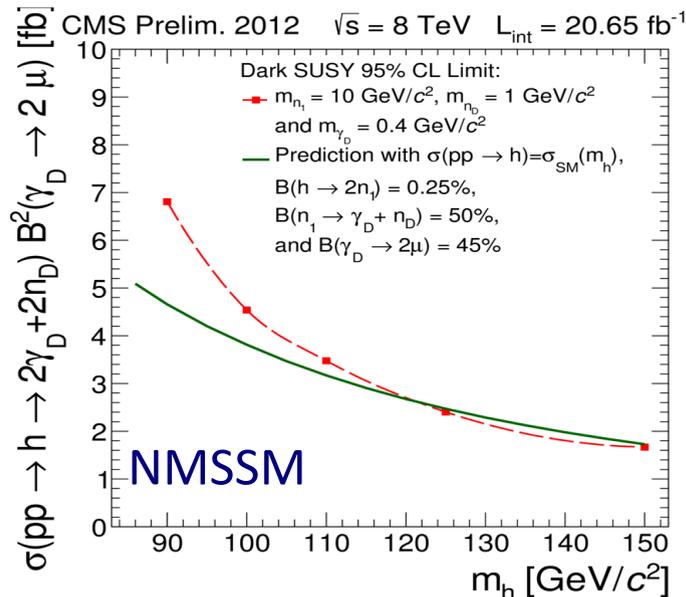

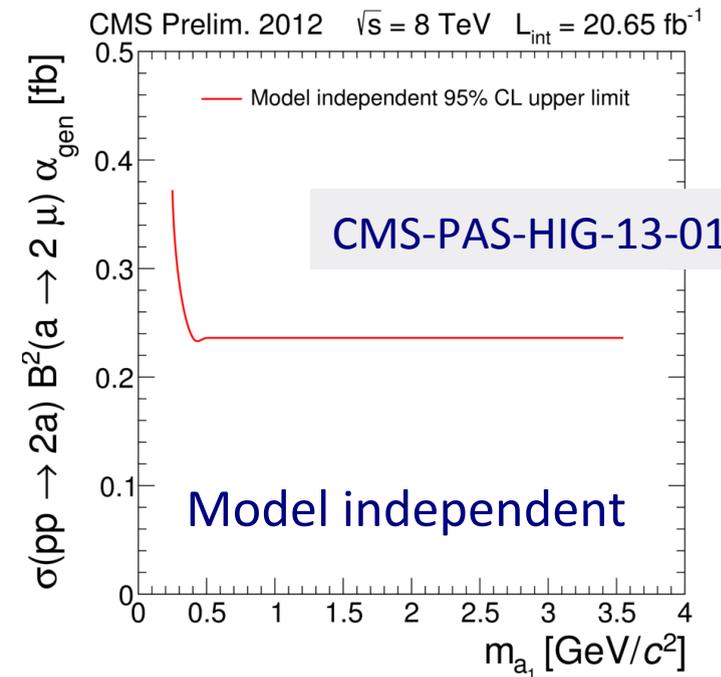

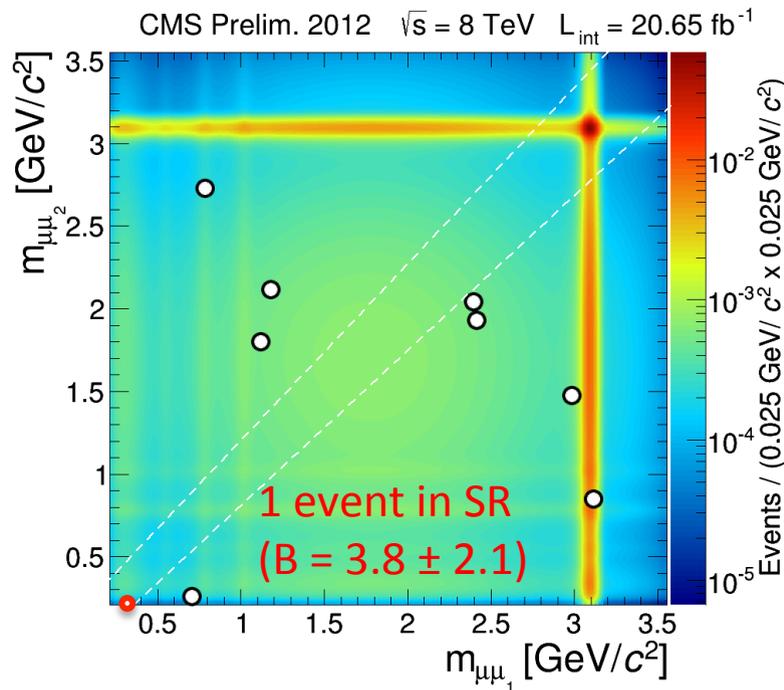

Search for decays into two very light bosons ( $m < 2 m_\tau$ ) decaying to OS, boosted muon pairs

## NMSSM

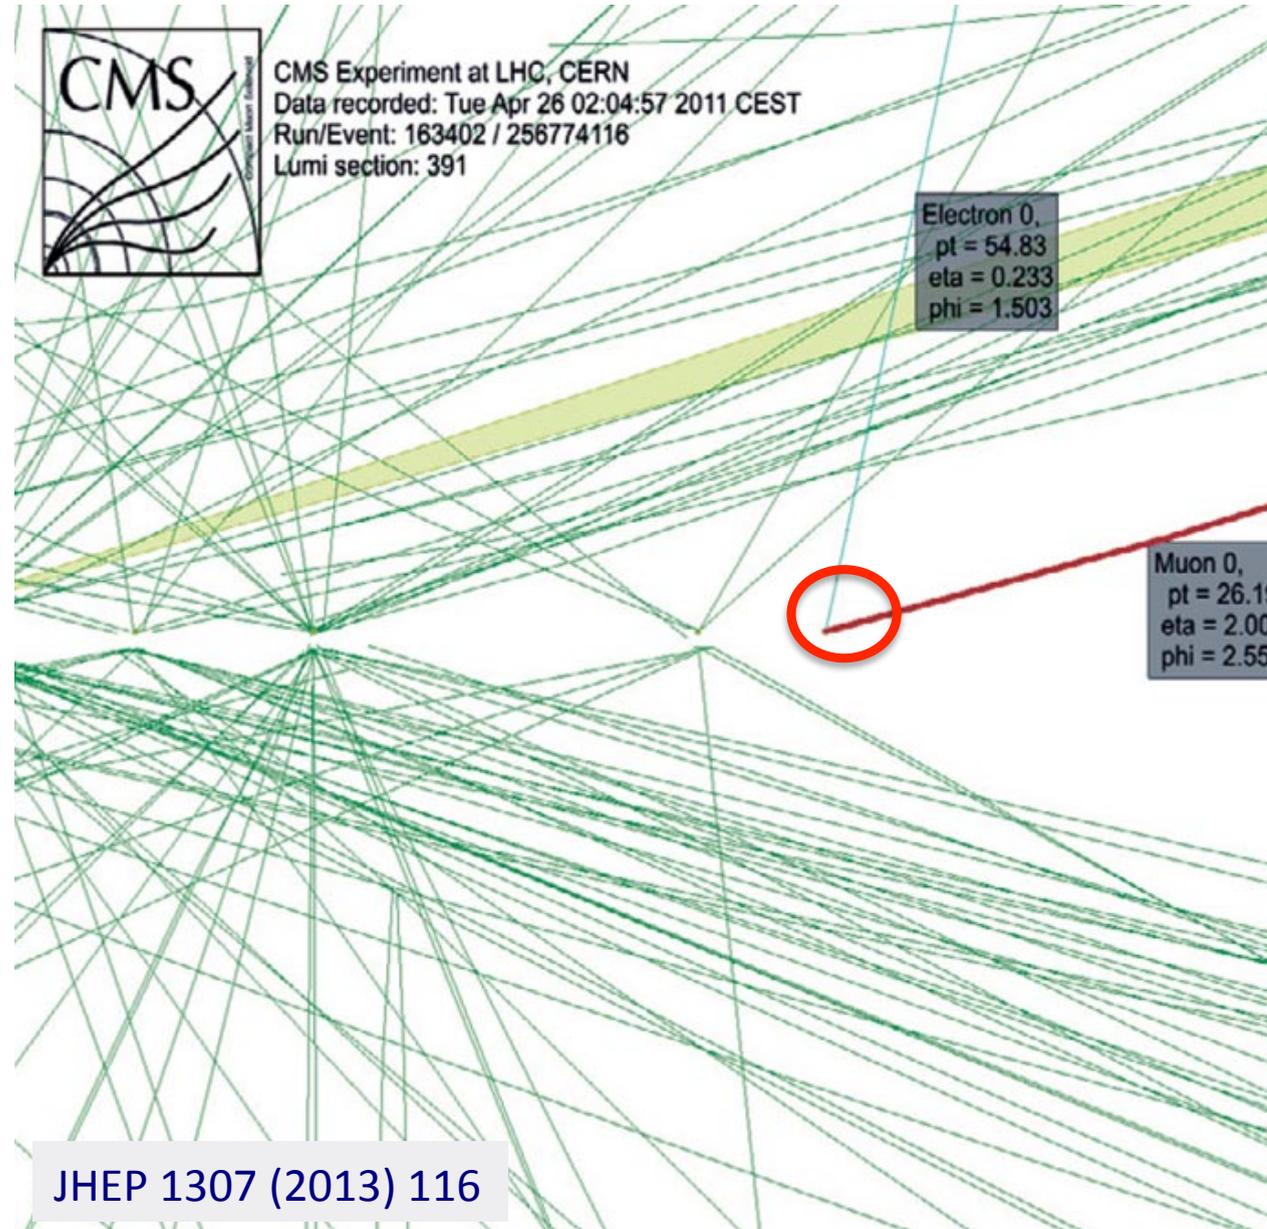

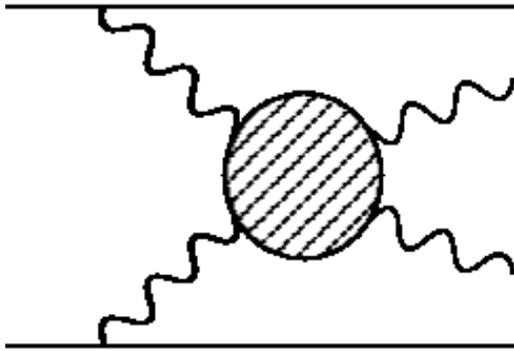

- $h_1$  or  $h_2$  corresponds to 125 GeV Higgs
- a new CP-odd Higgs

## Hidden-valley

- $h$  decays to lightest neutralino, which decays to a dark fermion + a (low-mass) dark photon that weakly couples to SM fermions
- cascades of dark particle decays might lead to larger multiplicity lepton-jets

# What if no additional state is seen?

Exclusive  $\gamma\gamma \rightarrow WW$  production candidate

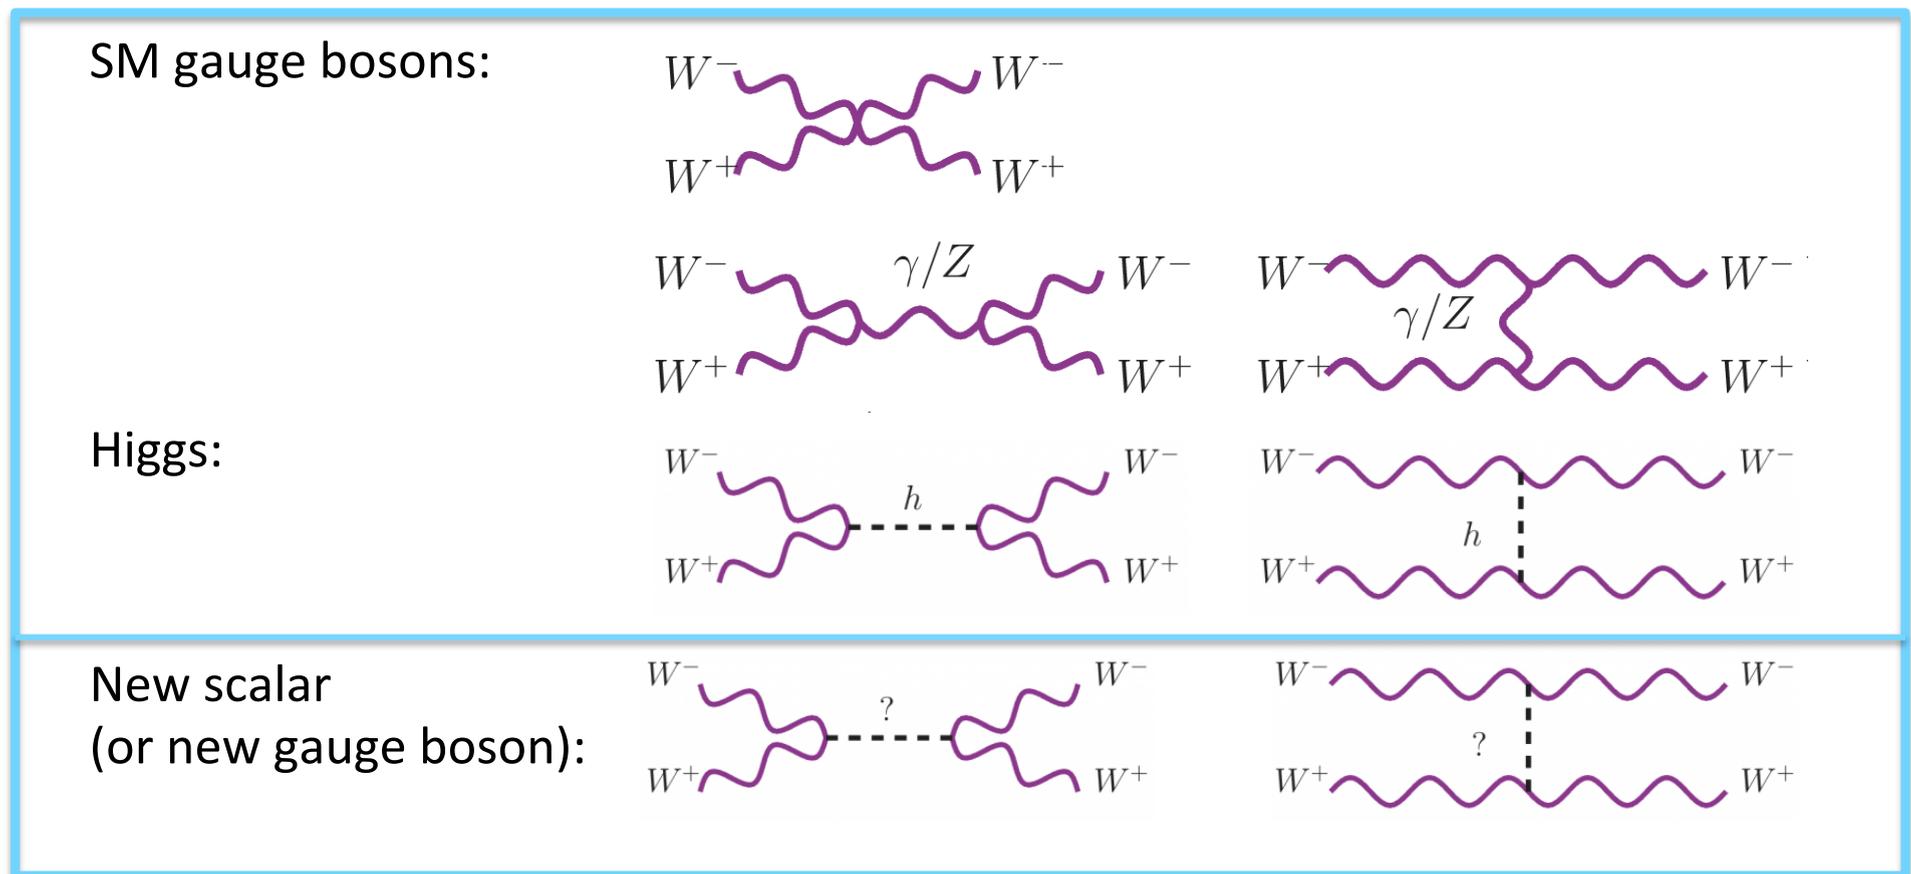

Gabriella.Pasztor@cern.ch : Beyond the Higgs

# VV scattering: a probe of EWSB

Vector boson scattering is „intimately” connected to EWSB and new physics

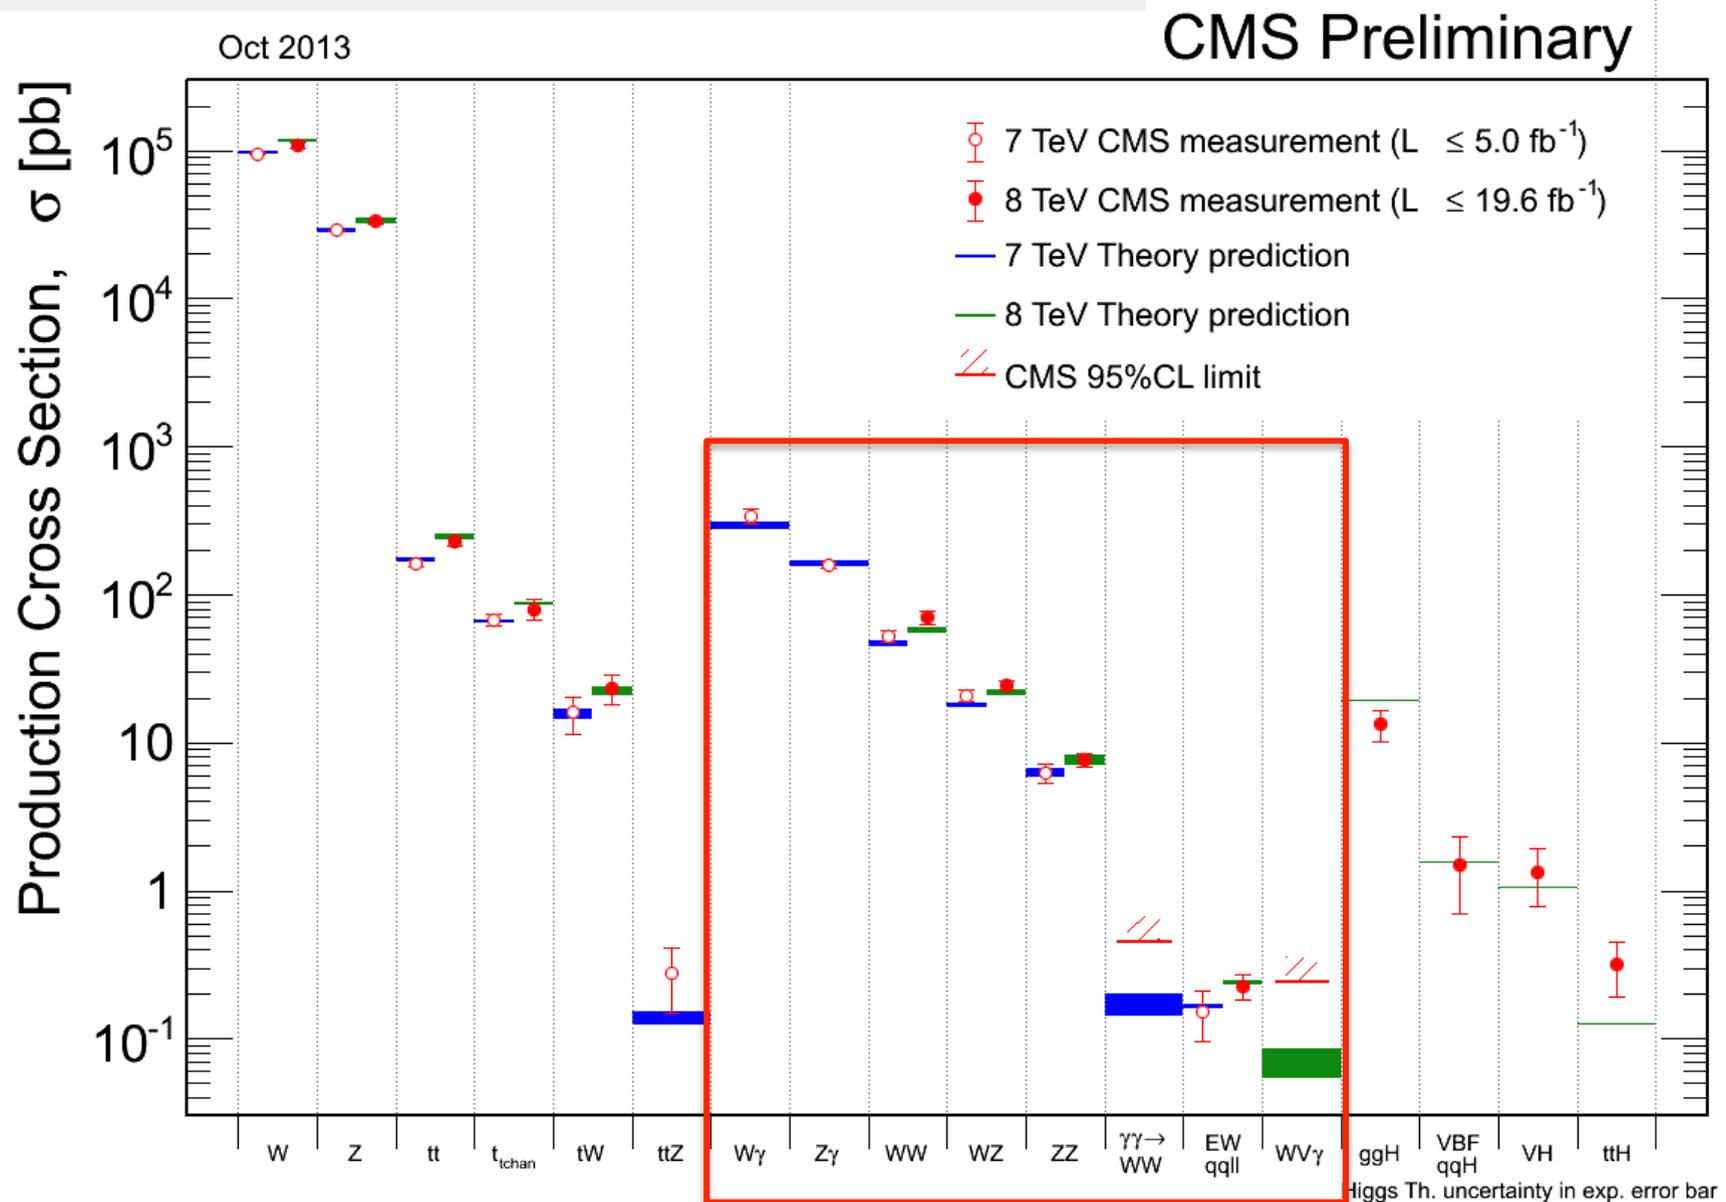

- In SM, unitarity in VV scattering is restored by Higgs exchange:  $\sigma \sim O(E^2) - O(E^2) \rightarrow O(E^0)$
- If HVV coupling is not exactly the SM value, unitarity is not realized [ $\sigma \sim O(E^2)$ ] or „delayed” until a new high-mass state enters

Even if no new physics is observed directly (finite energy reach, large backgrounds), VV scattering can reveal its existence

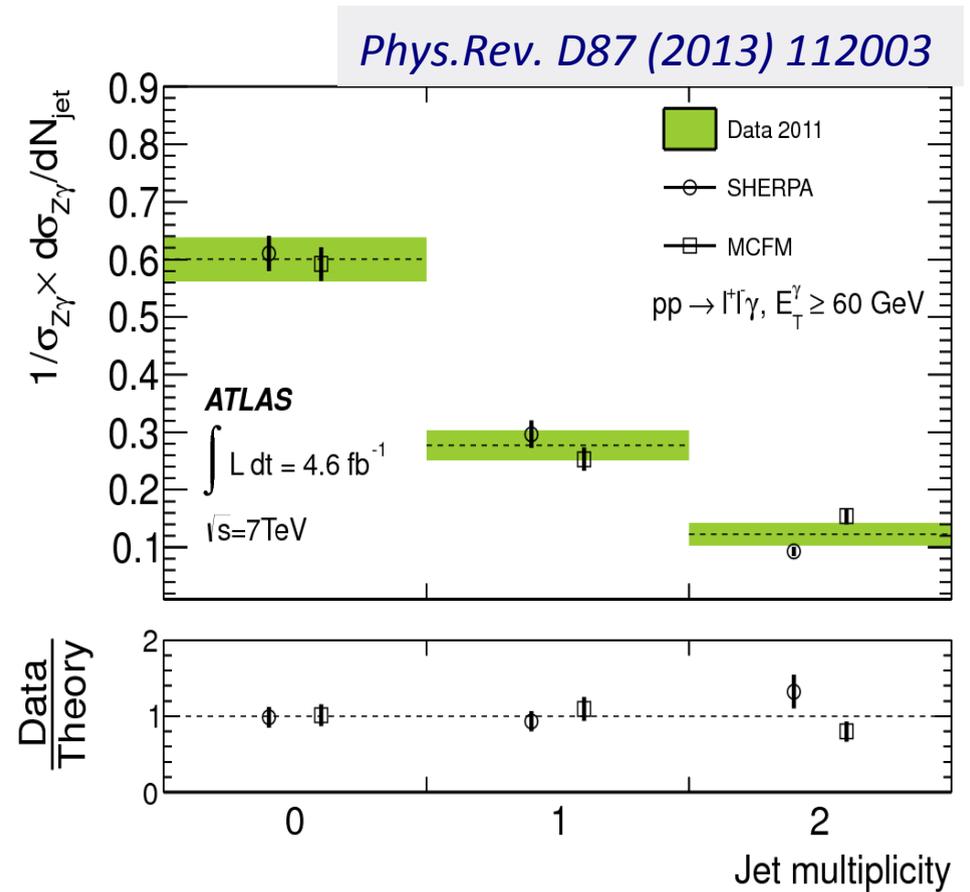

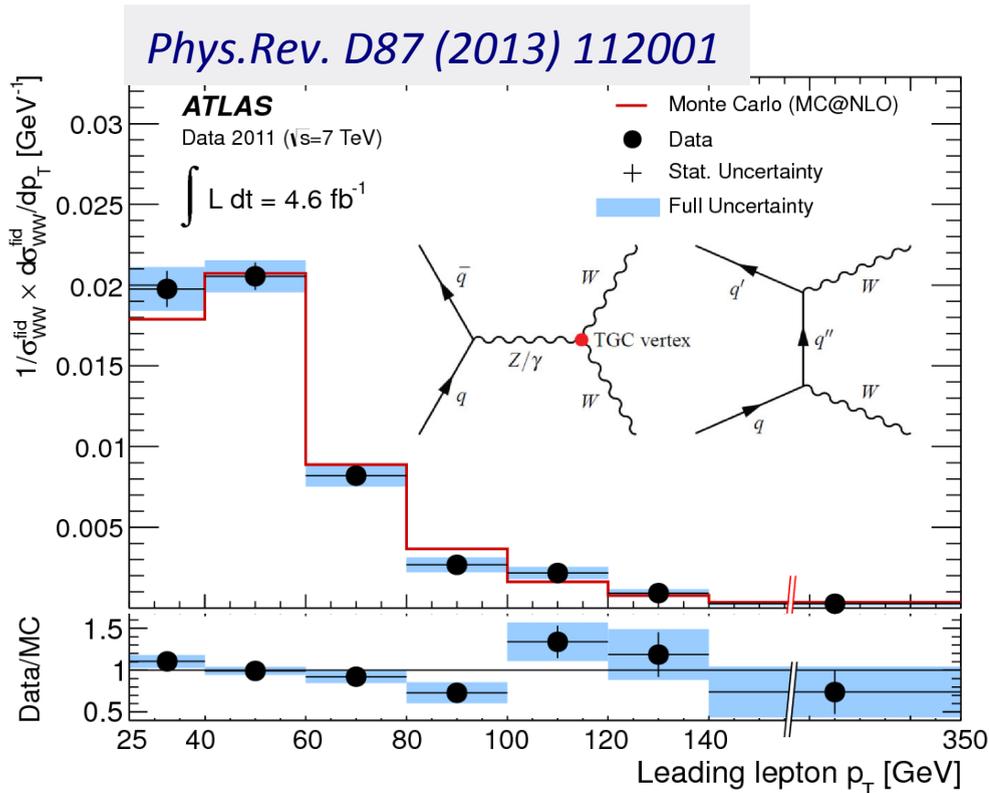

# State-of-the-art in multi-boson studies

<https://twiki.cern.ch/twiki/bin/view/CMSPublic/PhysicsResultsSMP>

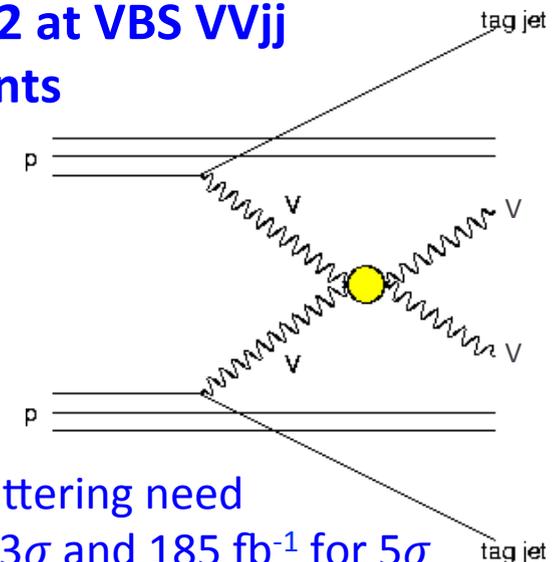

# Diboson measurements going differential...

- Jet multiplicity distribution only available for  $l\gamma$  and  $l\nu$  measurements
- Especial interesting for inclusive  $VVjj$  as a step towards vector boson scattering measurements, where forward jets tag the event

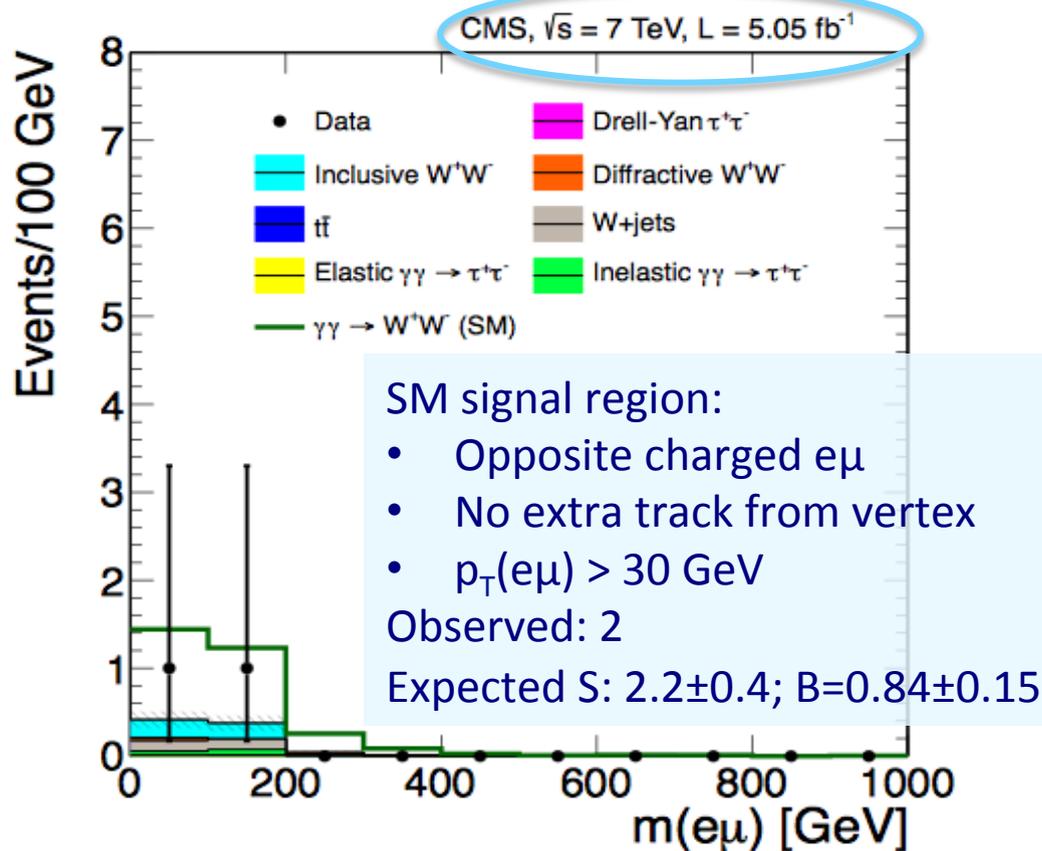

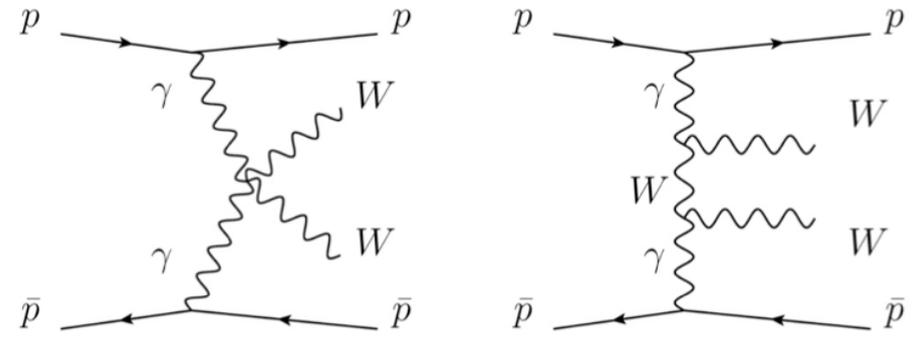

## Aim in Run 2 at VBS $VVjj$ measurements

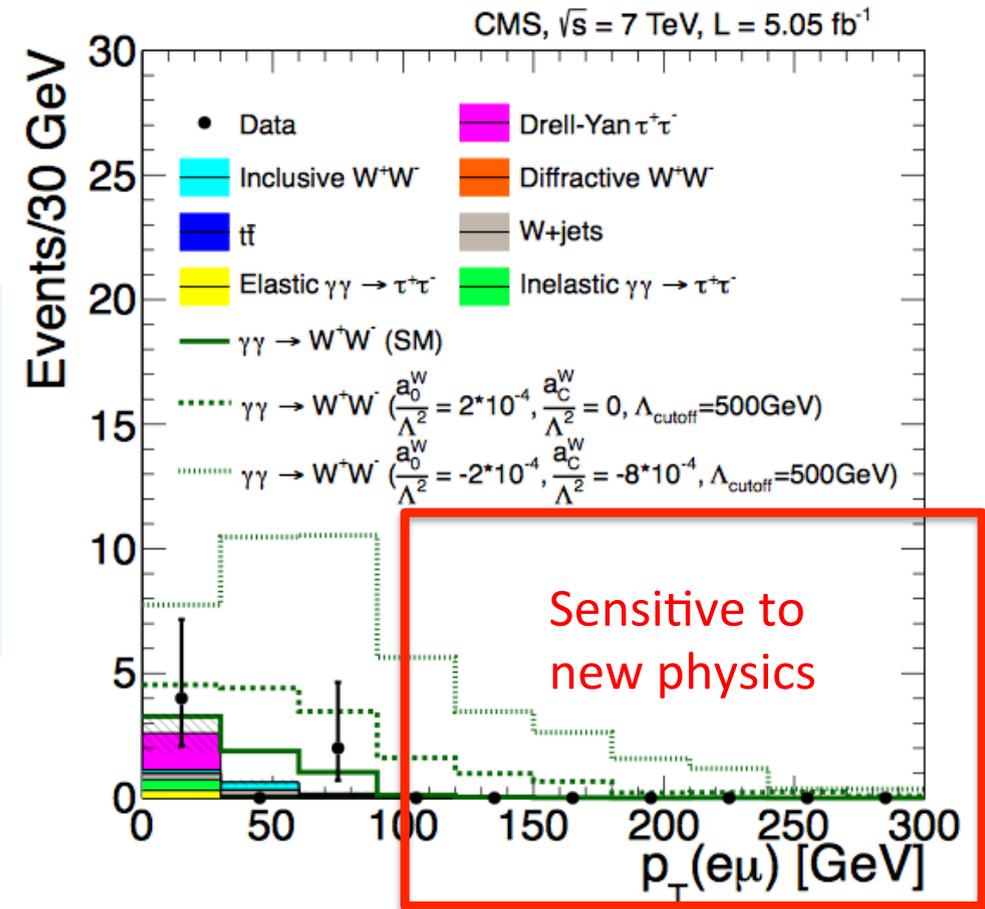

SM WZ scattering need  
75  $\text{fb}^{-1}$  for  $3\sigma$  and 185  $\text{fb}^{-1}$  for  $5\sigma$

# Exclusive $\gamma\gamma \rightarrow WW \rightarrow e\nu\mu\nu$

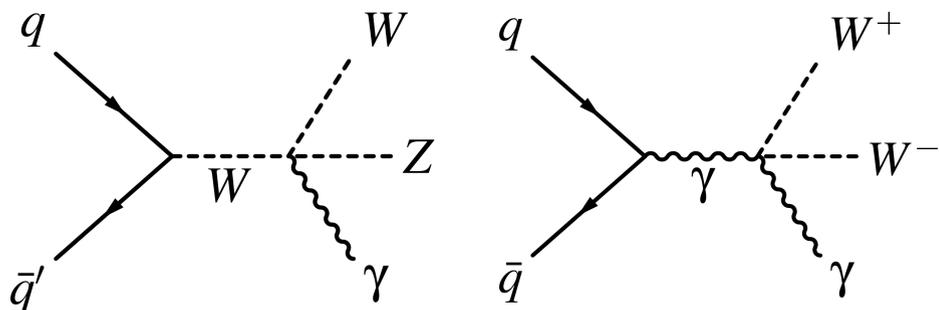

- Access  $\gamma\gamma WW$  quartic coupling
- Statistics limited measurement
- High  $p_T(e\mu)$  sensitive to anomalous couplings from new physics

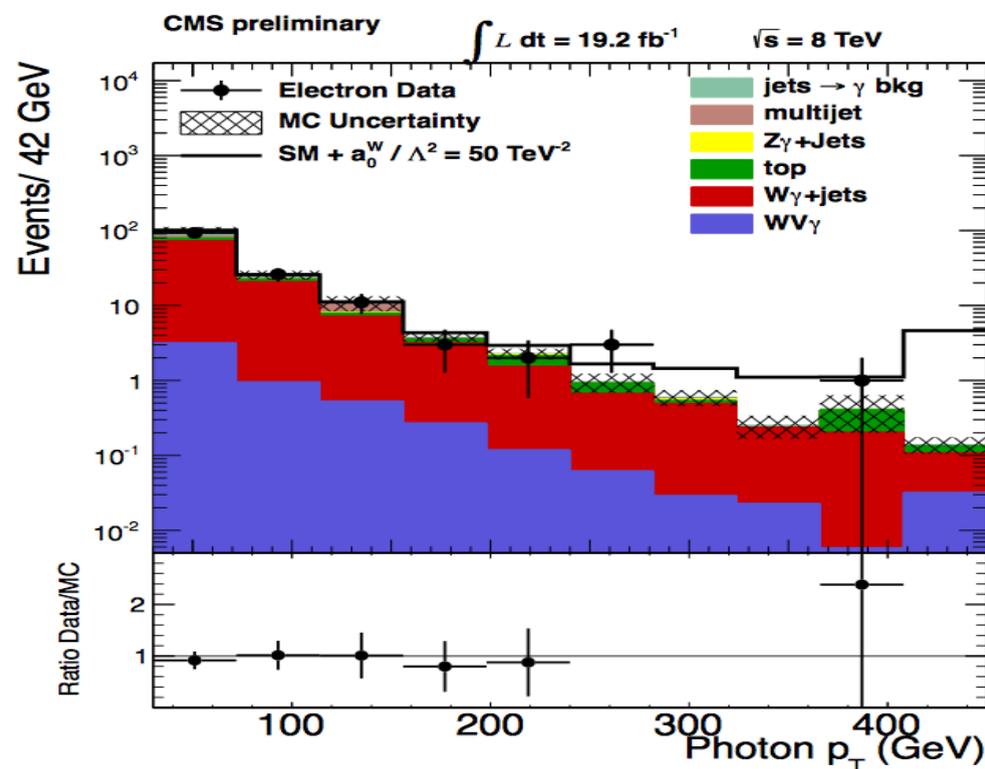

$\sigma = 2.2^{+3.3}_{-2.0} \text{ fb} (< 10.6 \text{ fb @ 95\%CL})$   
 $\sigma_{\text{SM}} = 4.0 \pm 0.7 \text{ fb}$

# Tri-boson production

- Leptonic W decay  $\rightarrow e, \mu$
- Hadronic W/Z  $\rightarrow 2$  jets
- Photon with  $p_T > 10$  GeV

Process	muon channel number of events	electron channel number of events
$W\gamma$ +jets	$136.9 \pm 3.5 \pm 9.2 \pm 0.0$	$101.6 \pm 2.9 \pm 8.0 \pm 0.0$
$WV$ +jet, jet $\rightarrow \gamma$	$33.1 \pm 1.3 \pm 4.6 \pm 0.0$	$21.3 \pm 1.0 \pm 3.1 \pm 0.0$

Total predicted	$193.9 \pm 3.9 \pm 10.8 \pm 1.0$	$147.6 \pm 4.8 \pm 9.6 \pm 0.7$
Data	183	139

Cross-section not yet accessible

Upper limit: 241 fb  
(3.4 x SM)

CMS-PAS-SMP-13-009

# Anomalous quartic gauge coupling limits

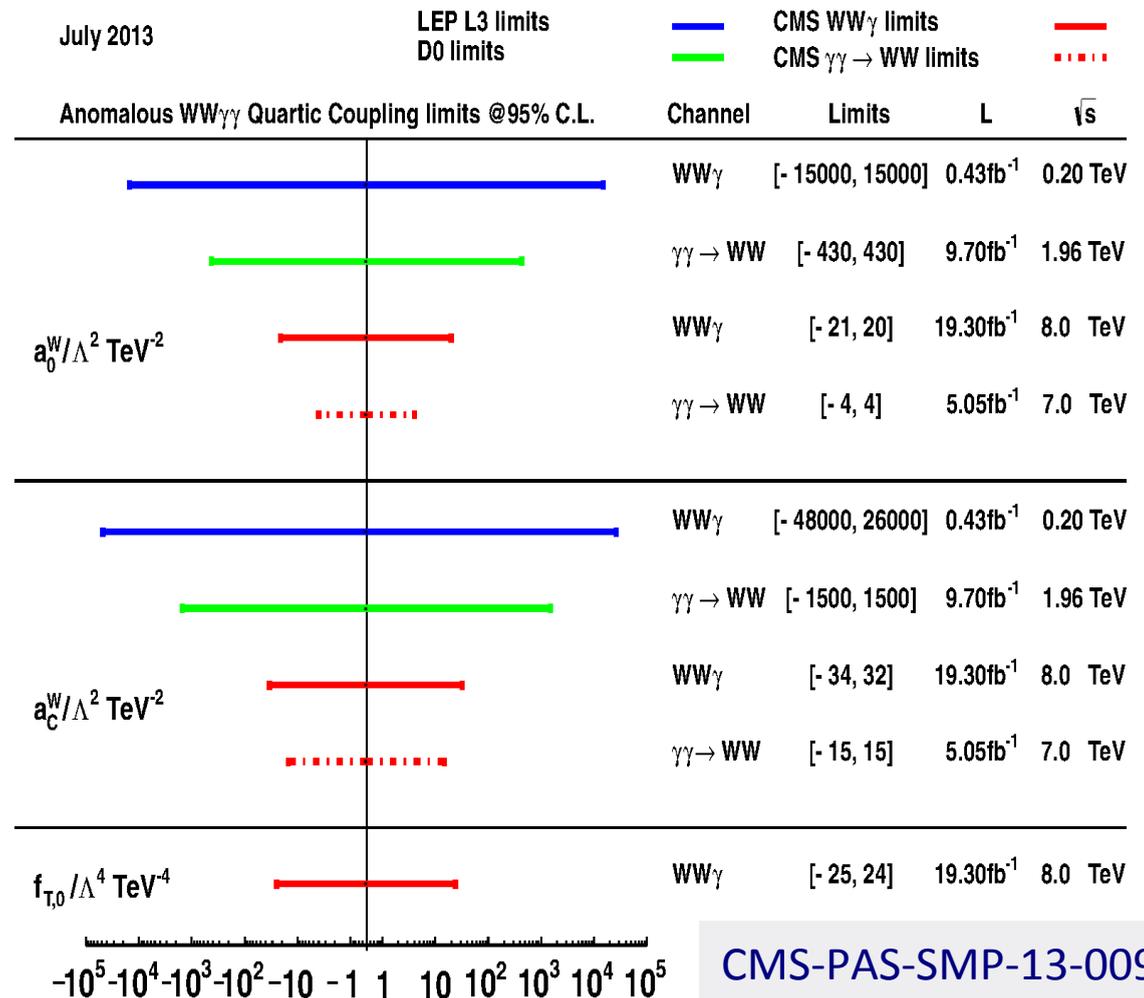

- EFT Lagrangian parametrizing possible new physics

$$L = L_{SM} + \sum_d \sum_i \frac{C_i^{(d)}}{\Lambda^{d-4}} O_i^{(d)}$$

- Dim-6 and dim-8 operators by integrating out the new degrees of freedom
- Coefficients to be calculated from more complete high-energy theory
- Unitarity violation  
→ form-factors, cut-off
- Large theoretical uncertainties

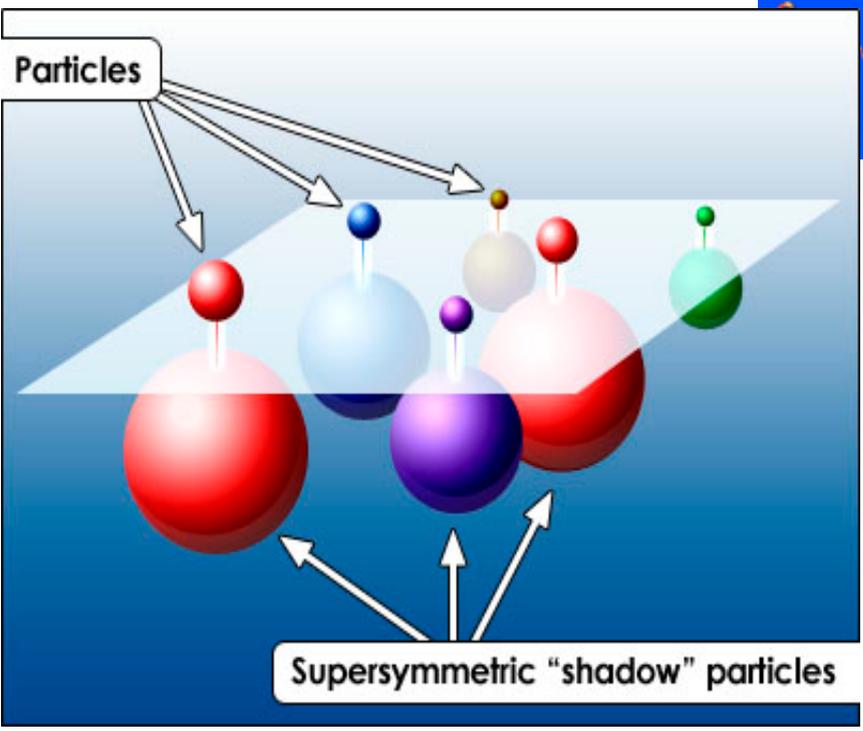

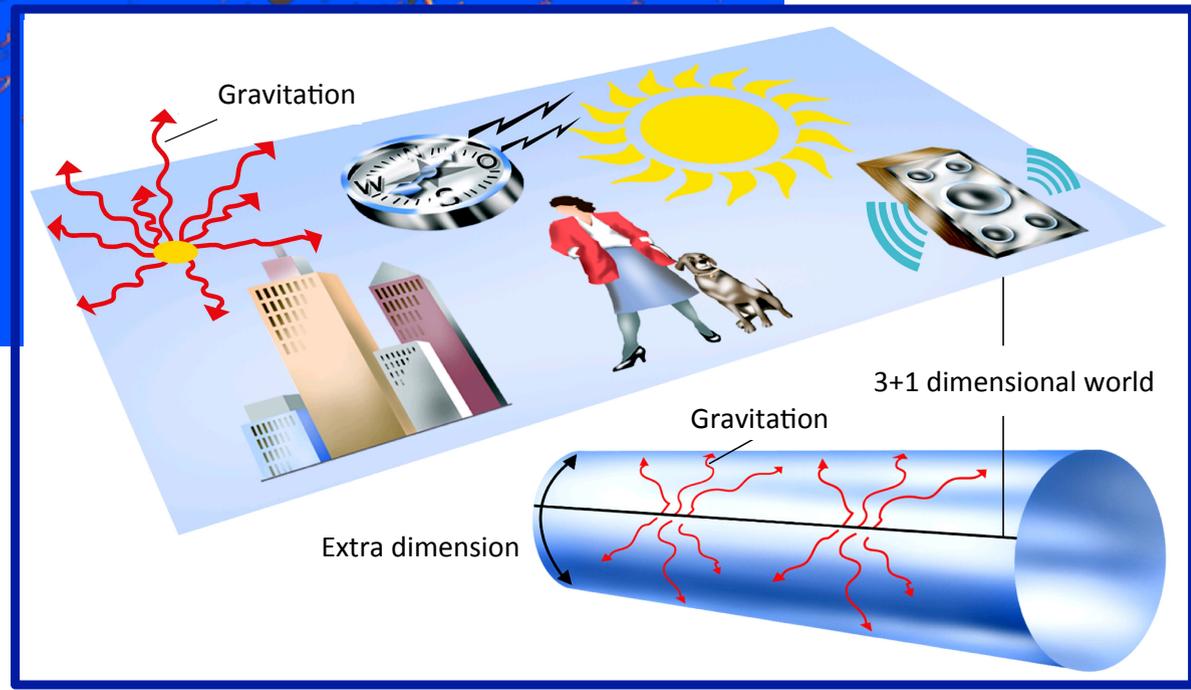

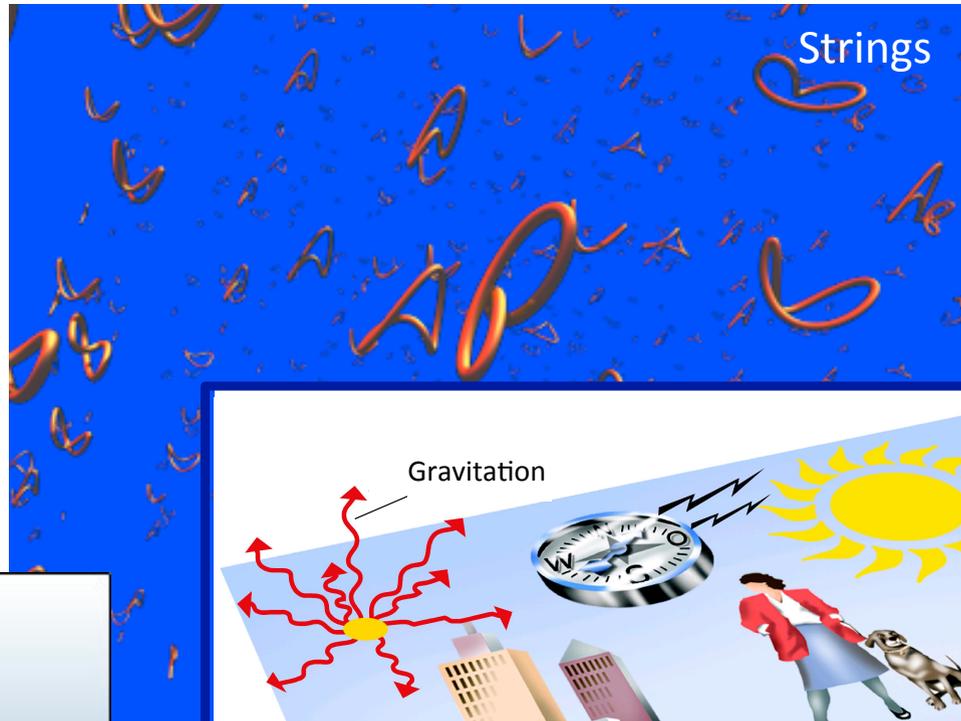

$$L_6^0 = \frac{e^2 a_0^W}{8 \Lambda^2} F_{\mu\nu} F^{\mu\nu} W^{+\alpha} W_{\alpha}^{-} - \frac{e^2}{16 \cos^2 \Theta_W} \frac{a_0^Z}{\Lambda^2} F_{\mu\nu} F^{\mu\nu} Z^{\alpha} Z_{\alpha}$$

$$L_6^C = \frac{-e^2 a_C^W}{16 \Lambda^2} F_{\mu\alpha} F^{\mu\beta} (W^{+\alpha} W_{\beta}^{-} + W^{-\alpha} W_{\beta}^{+}) - \frac{e^2}{16 \cos^2 \Theta_W} \frac{a_C^Z}{\Lambda^2} F_{\mu\alpha} F^{\mu\beta} Z^{\alpha} Z_{\beta}$$

# LHC schedule beyond LS1

Only EYETS (19 weeks) (no Linac4 connection during Run2)

LS2 starting in 2018 (July) 18 months + 3months BC (Beam Commissioning)

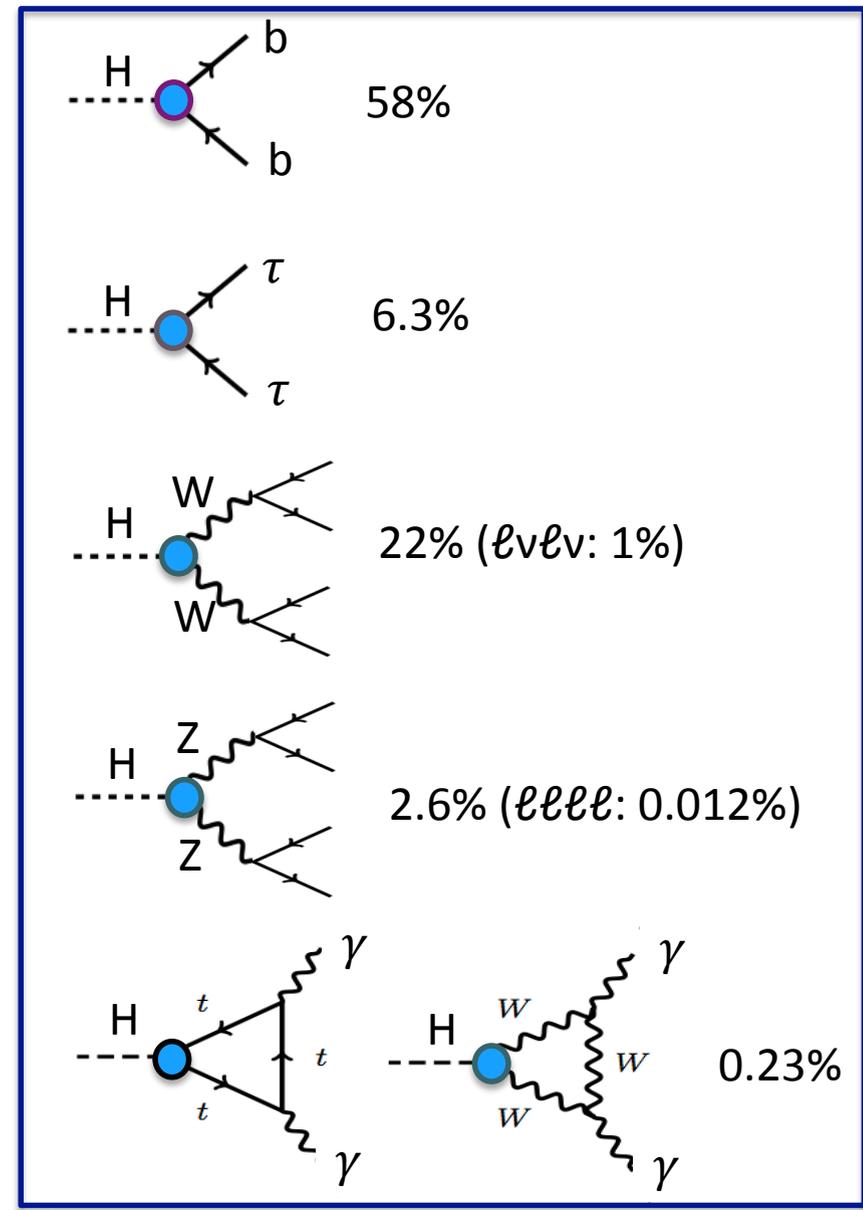

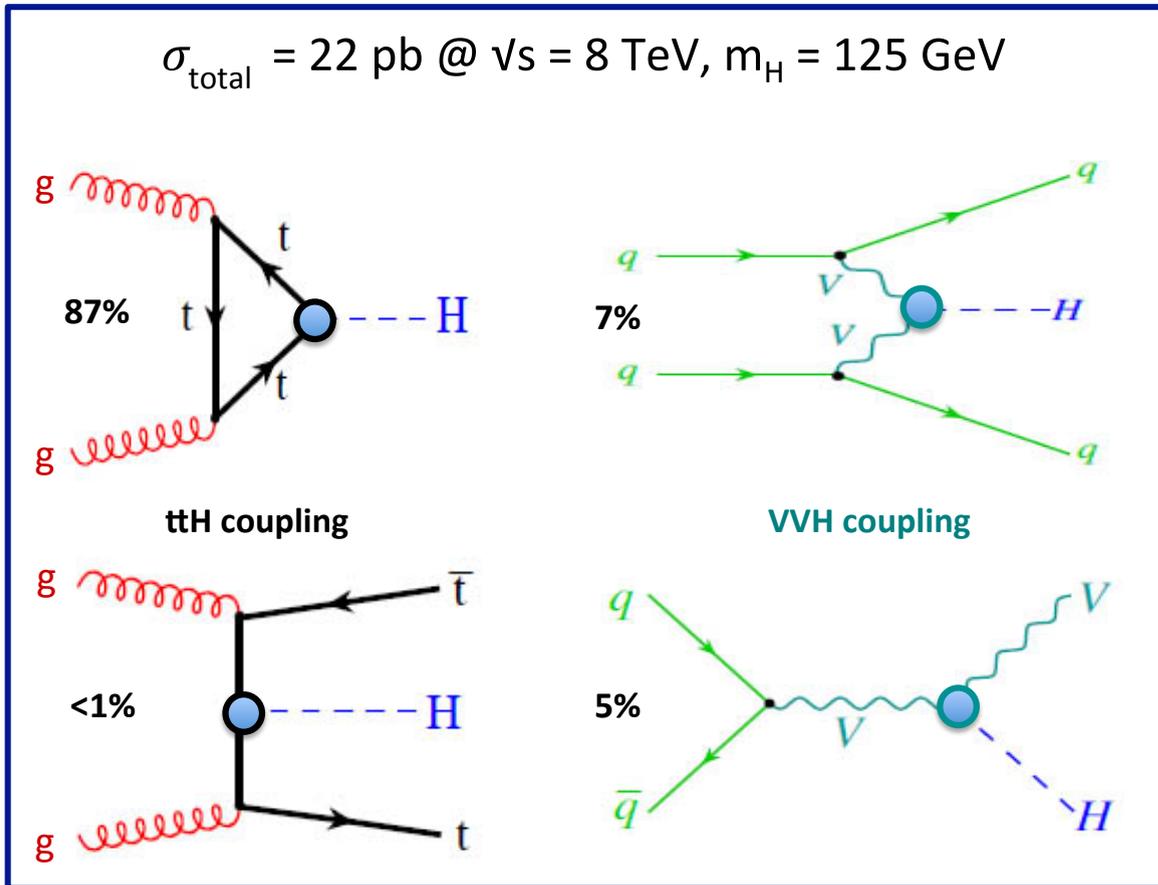

LS3 LHC: starting in 2023 => 30 months + 3 BC

injectors: in 2024 => 13 months + 3 BC

LHC schedule approved by CERN management and LHC experiments spokespersons and technical coordinators  
Monday 2<sup>nd</sup> December 2013

# Higgs production and decay

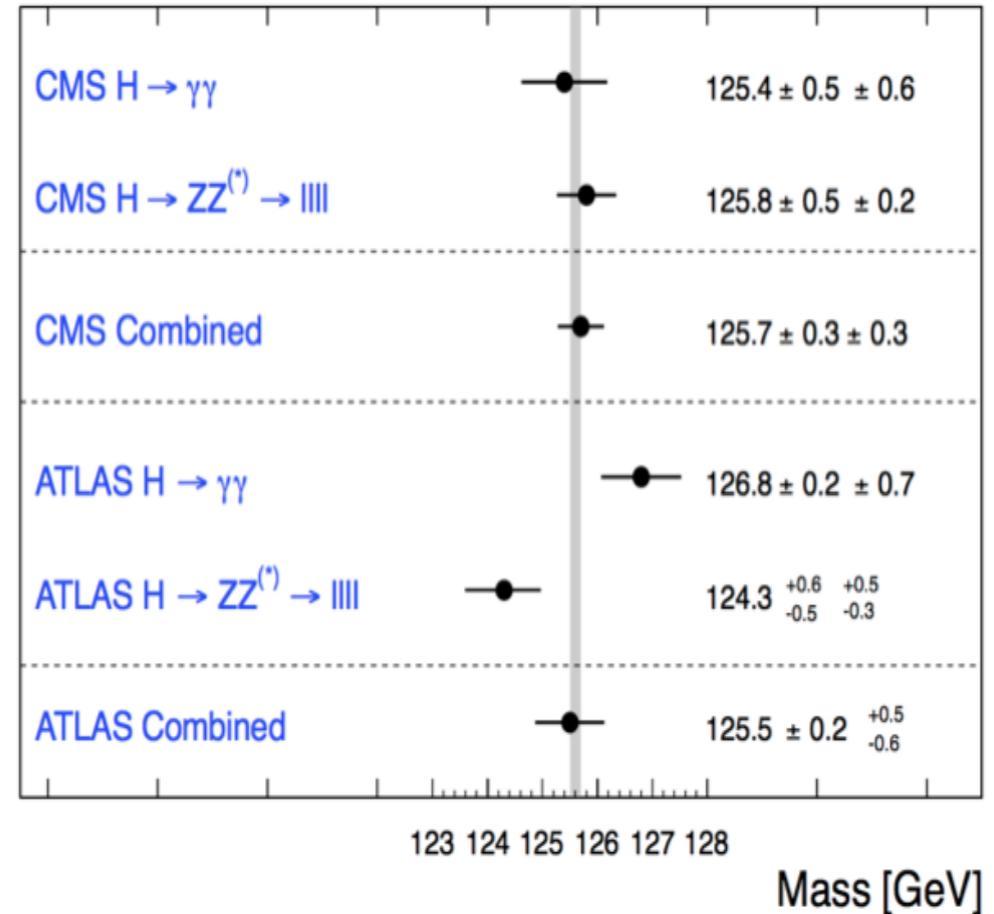

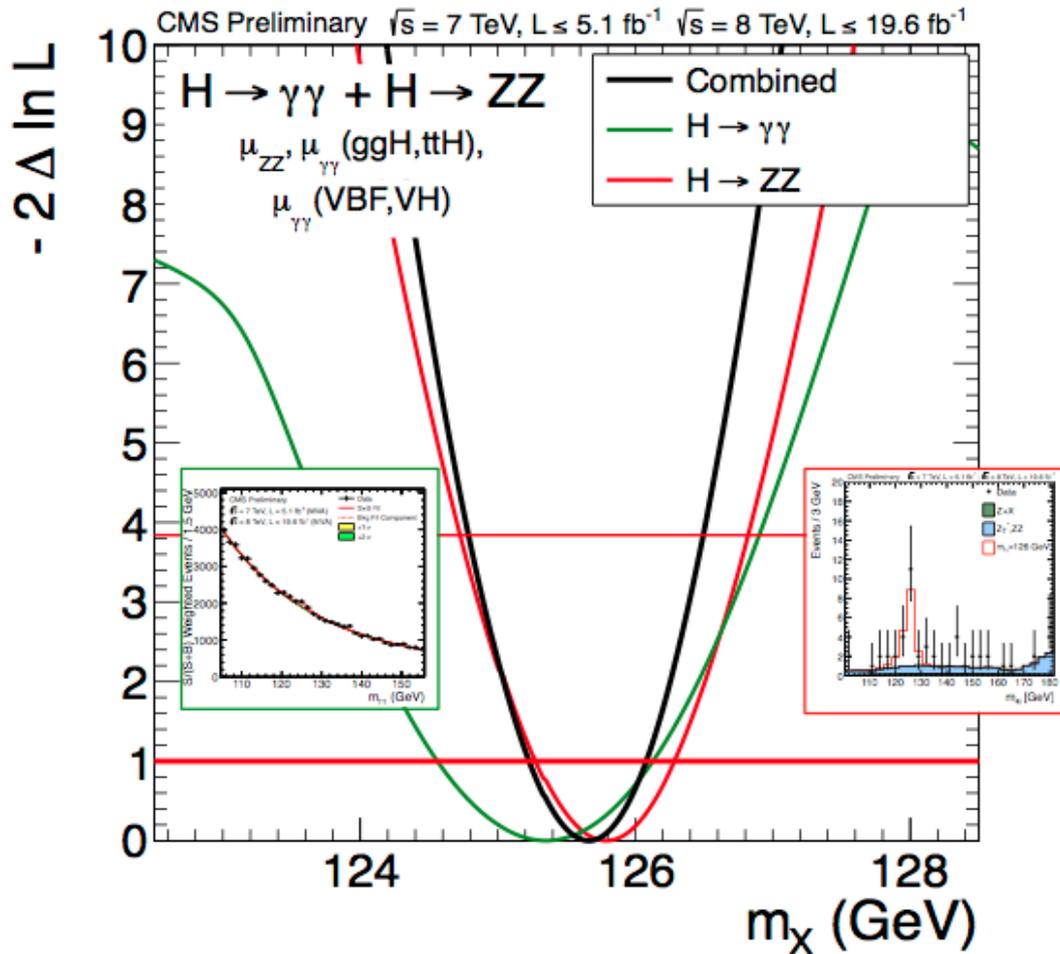

Measuring different production and decay modes, the different coupling constants can be determined

$$g(Hff) \propto m_{\text{fermion}}$$

$$g(HVV) \propto m_{\text{bozon}}^2$$

# Higgs mass

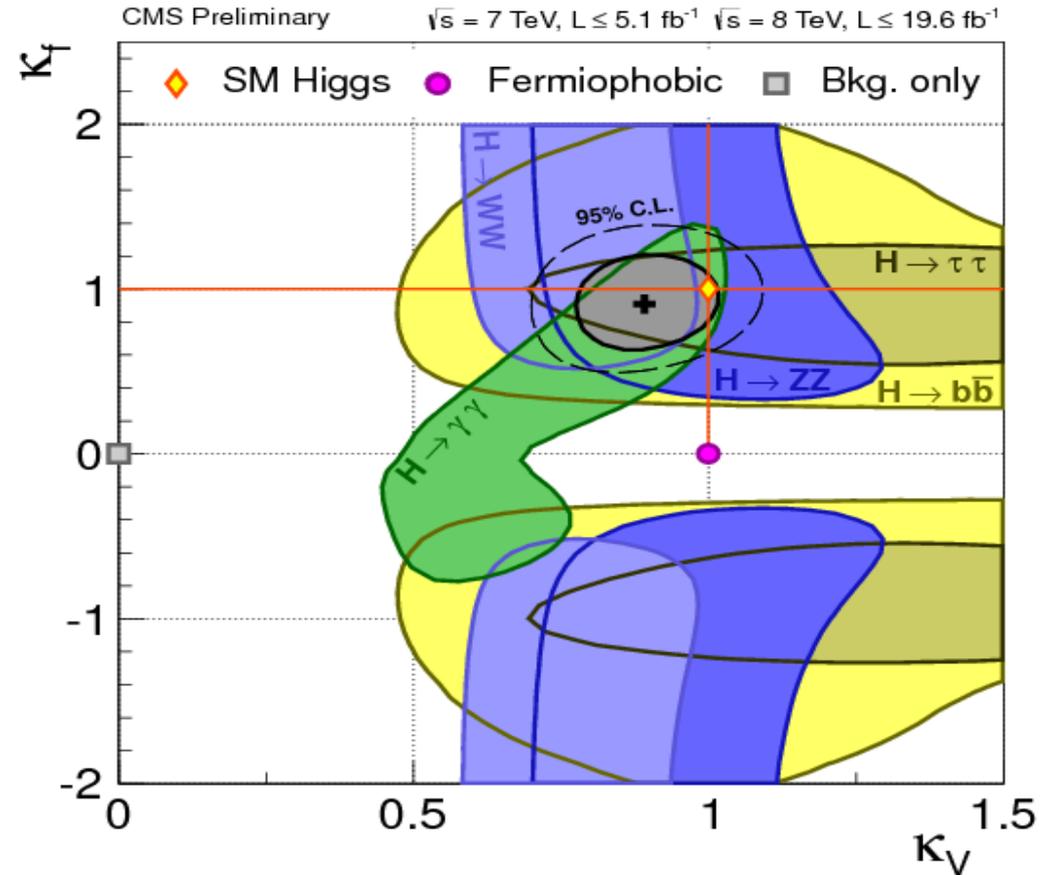

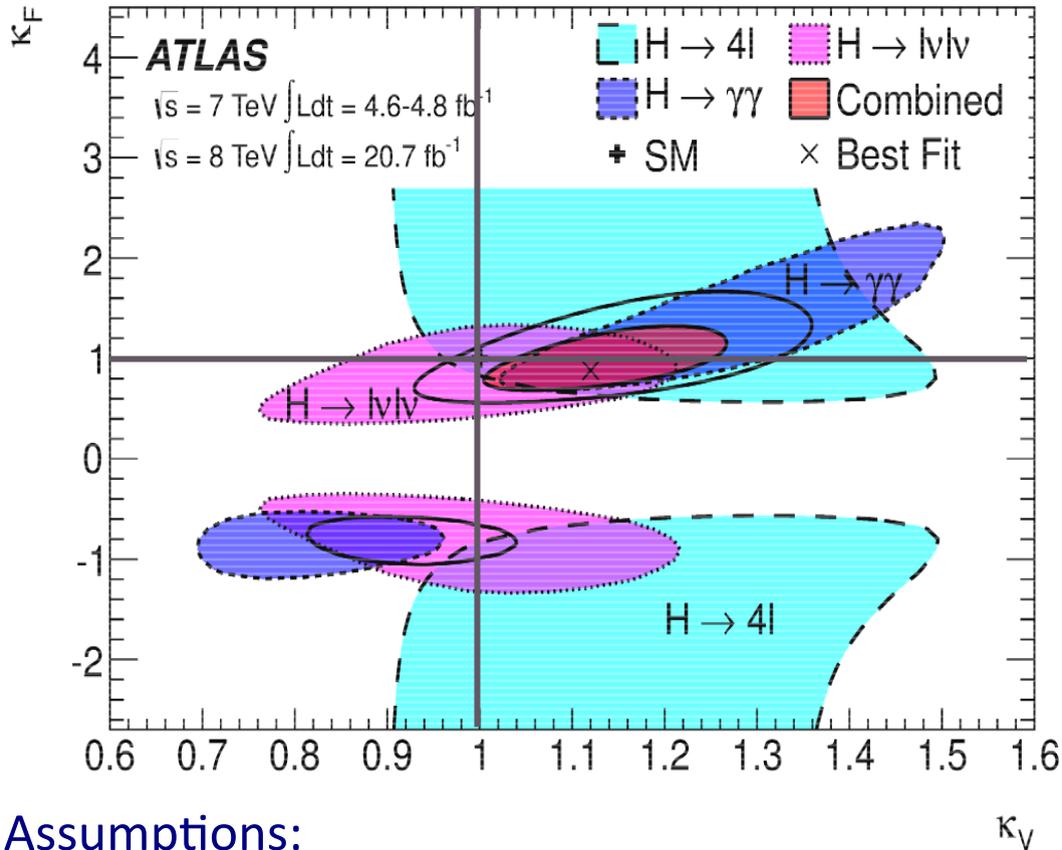

Final results require final Run1 calibration

**Constrains both SUSY and composite-Higgs models!** (See an example later...)

# Coupling constant scale factors

$$\kappa_i \equiv g_i / g_i^{\text{SM}}$$

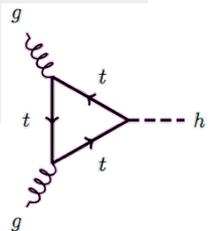

## $\kappa_V$ VS. $\kappa_F$

### Assumptions:

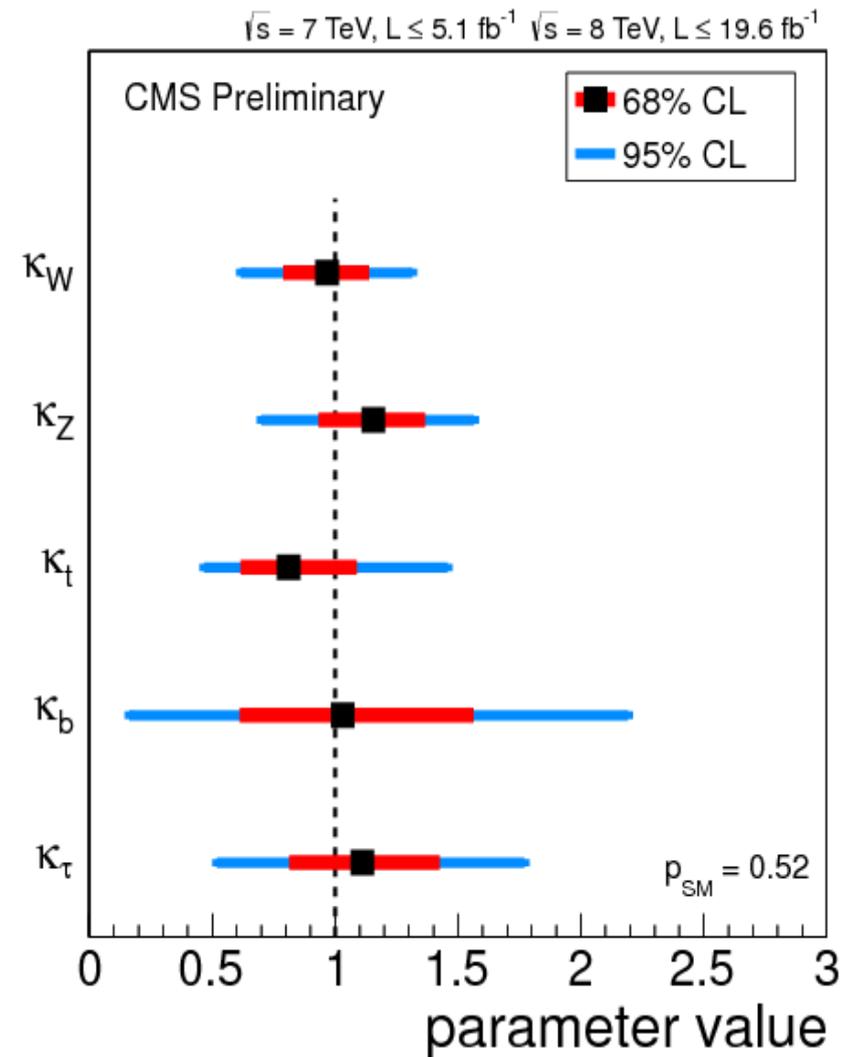

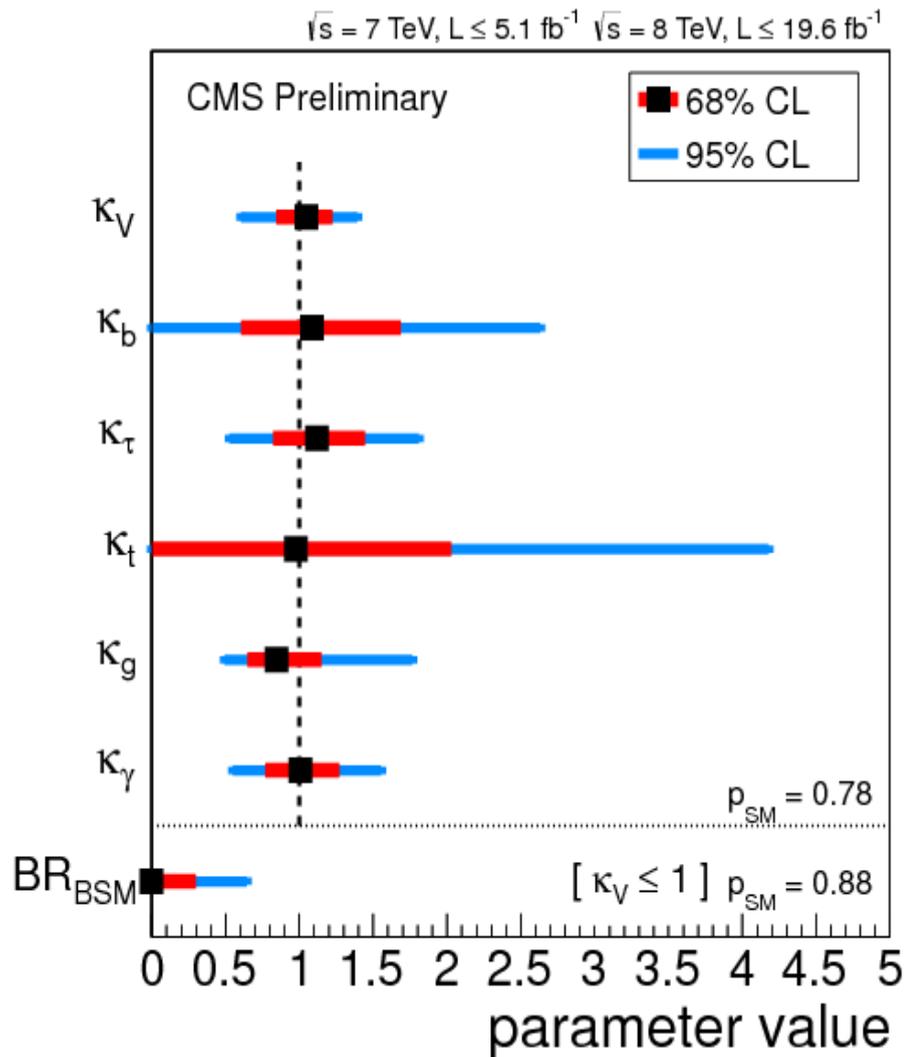

- All fermion (t,b,  $\tau$ , ..) couplings scale with  $\kappa_F$
- All heavy vector boson (W, Z) couplings scale with  $\kappa_V$
- No other new physics contributes to the total width:  
 $\kappa_g(\kappa_F \kappa_V), \kappa_\gamma(\kappa_F \kappa_V)$
- Total width  $\Gamma_H$  scales with  $\kappa_H^2 \approx 0.7 \kappa_F^2 + 0.3 \kappa_V^2$

- **Agreement with SM within 10-20% precision**
- **$\kappa_F=0$  excluded with  $>5\sigma$  (from indirect ggH loop)**

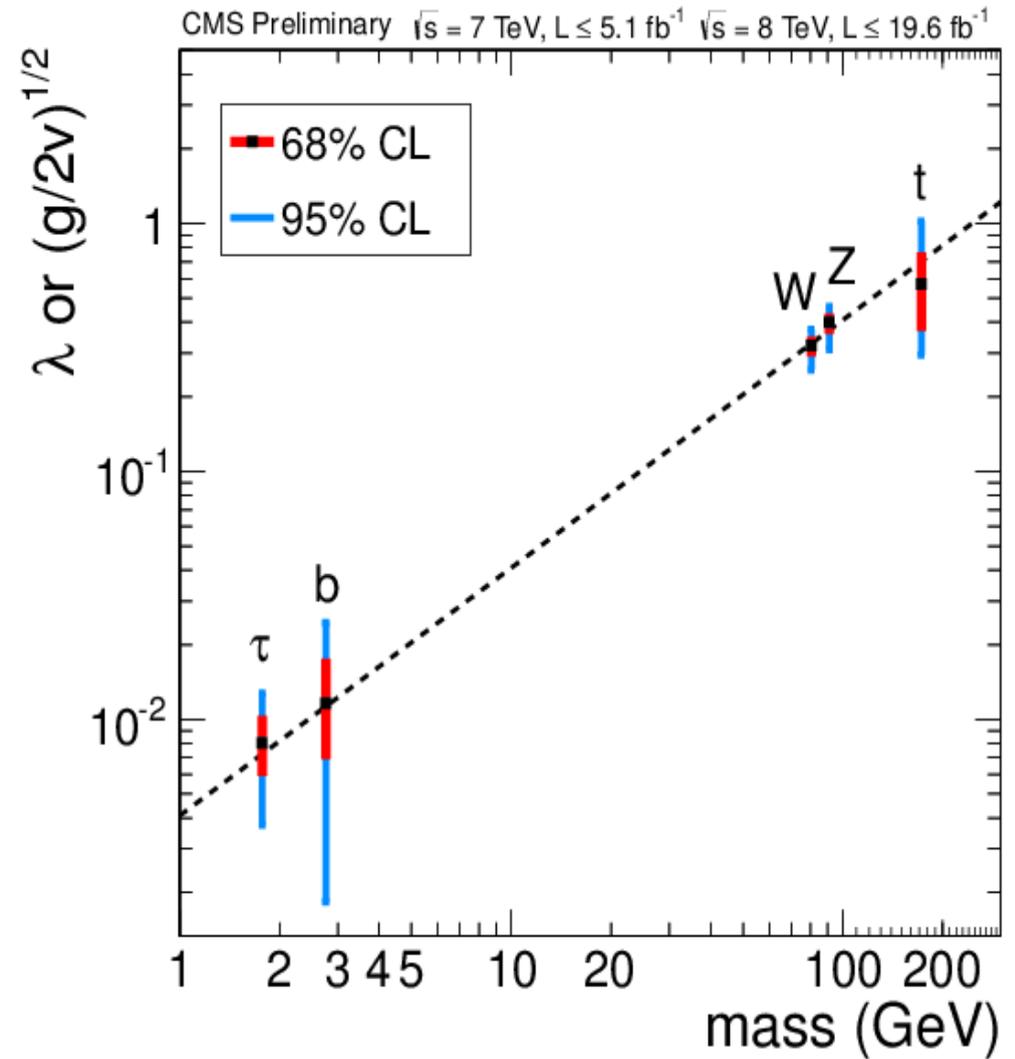

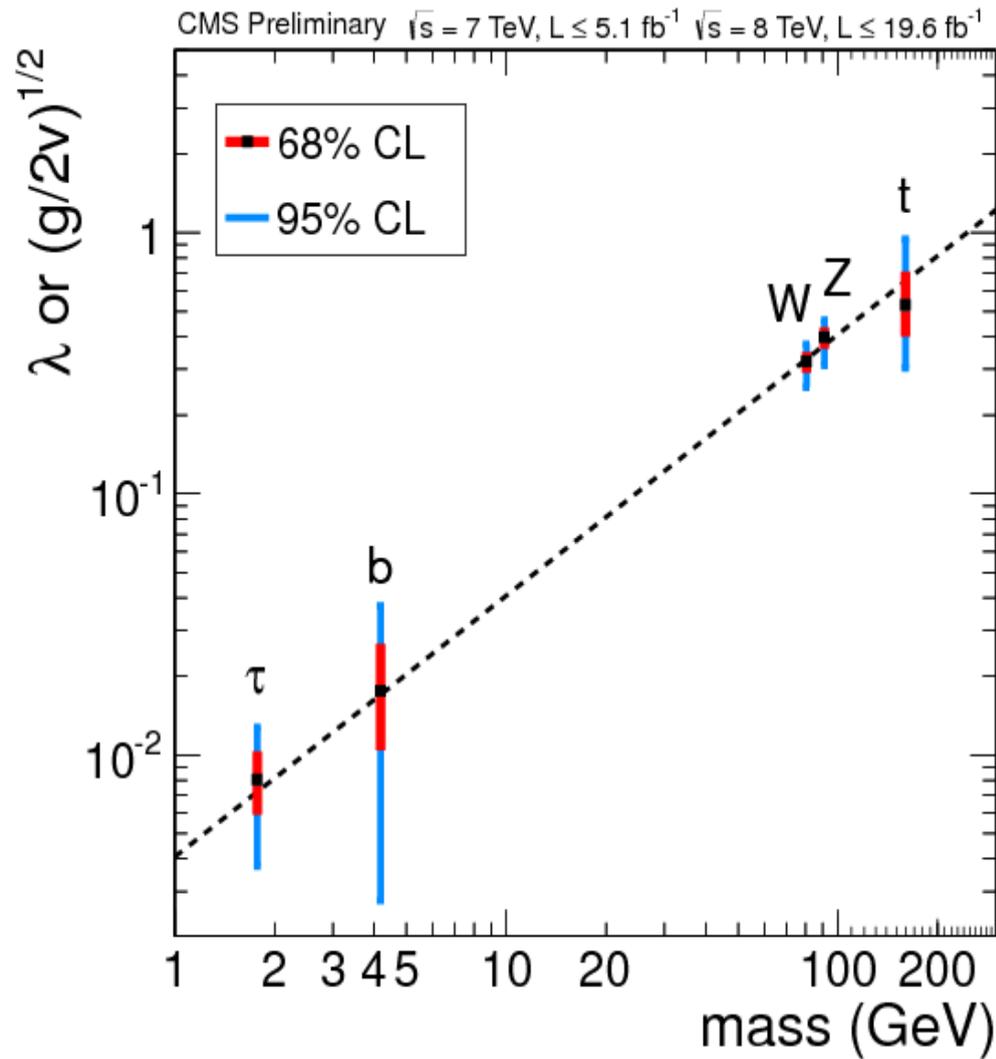

# Coupling constant scale factors

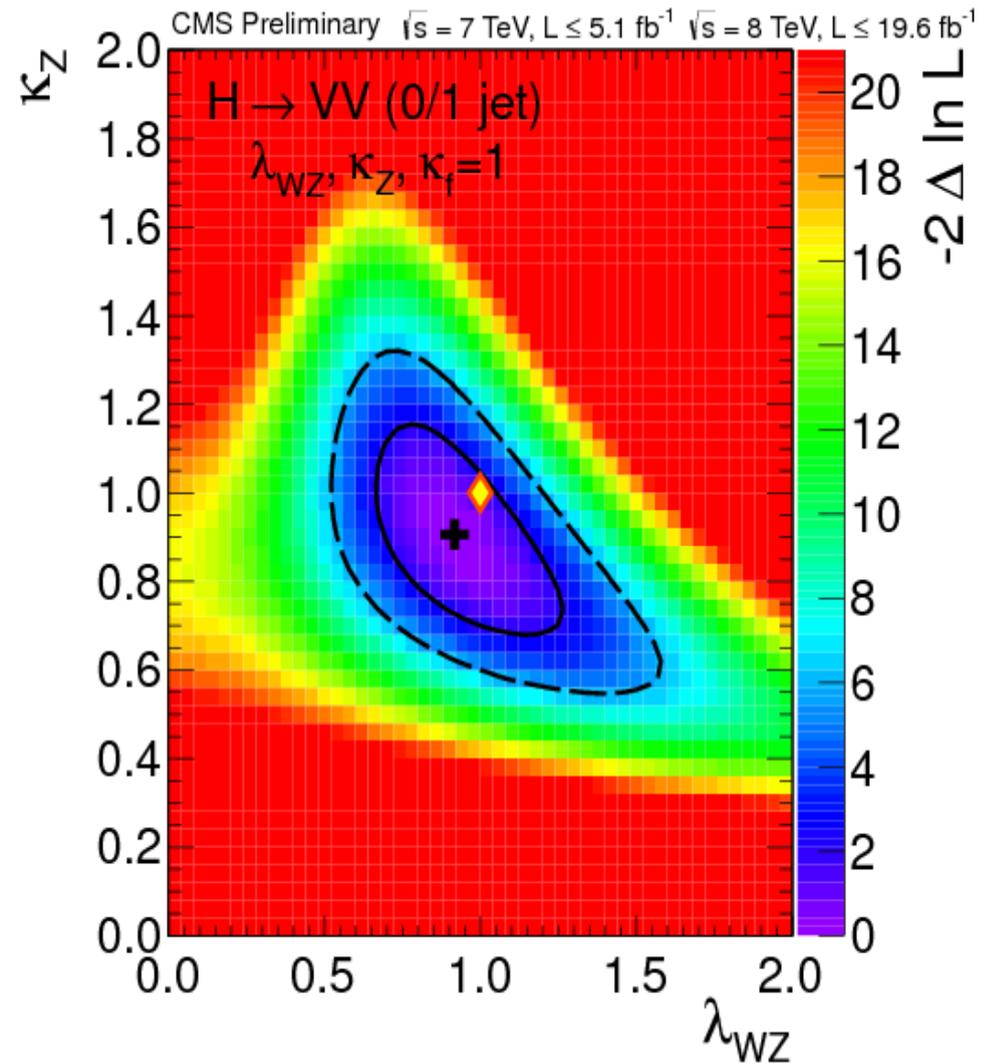

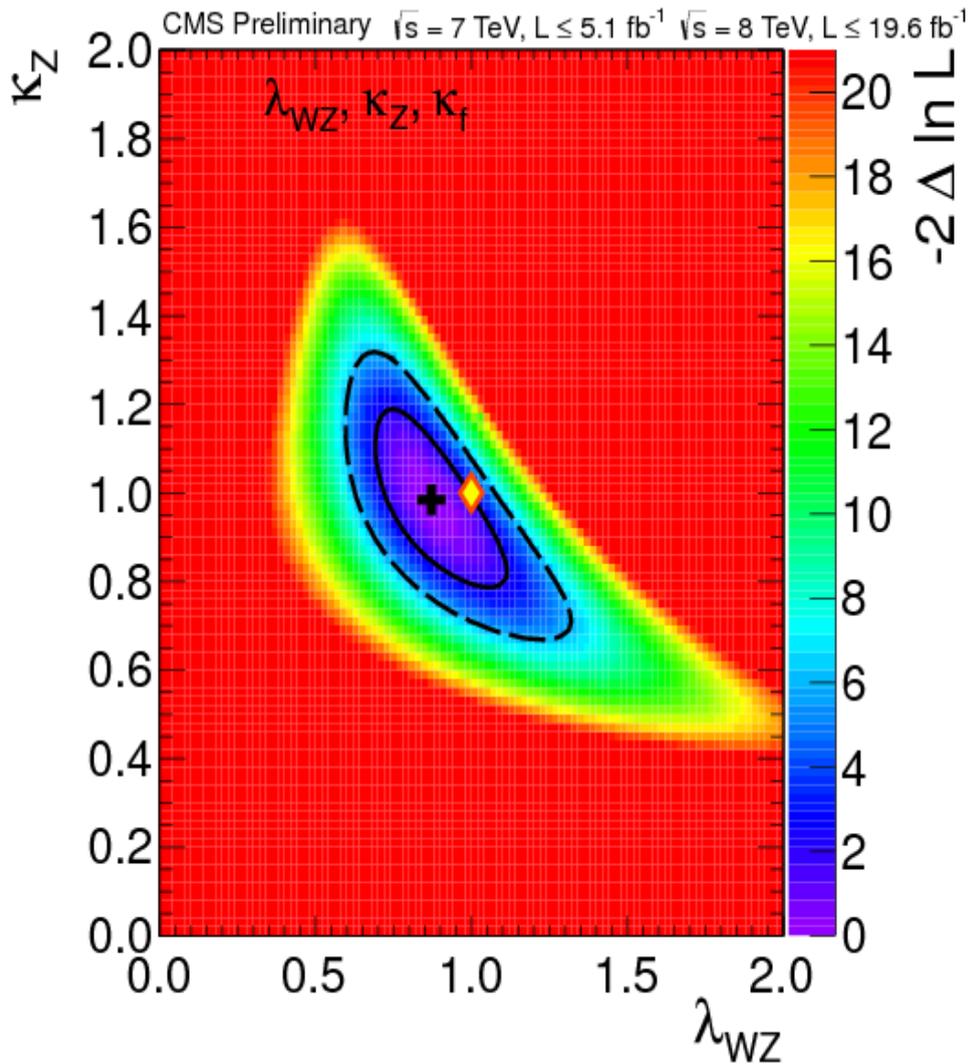

$$\kappa_i \equiv g_i / g_i^{\text{SM}}$$

# Higgs coupling vs. mass

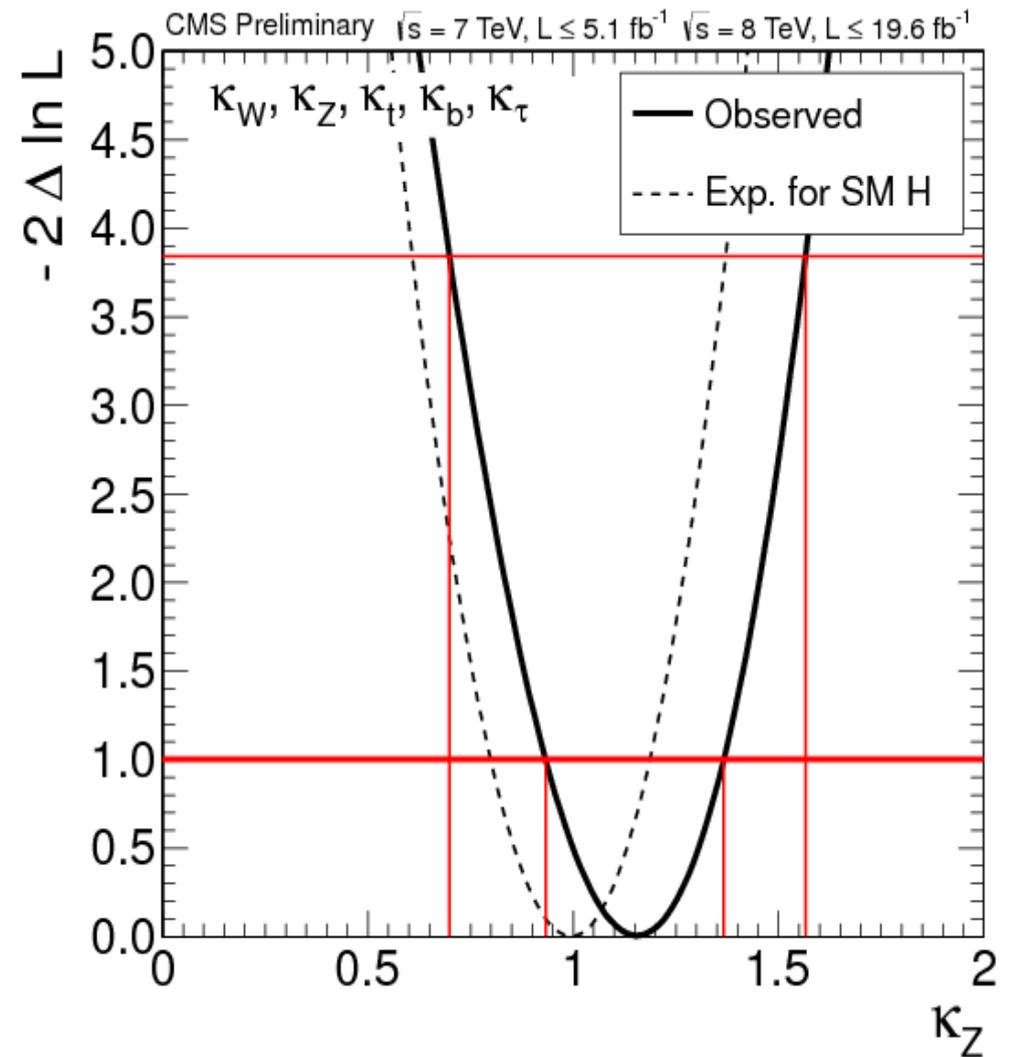

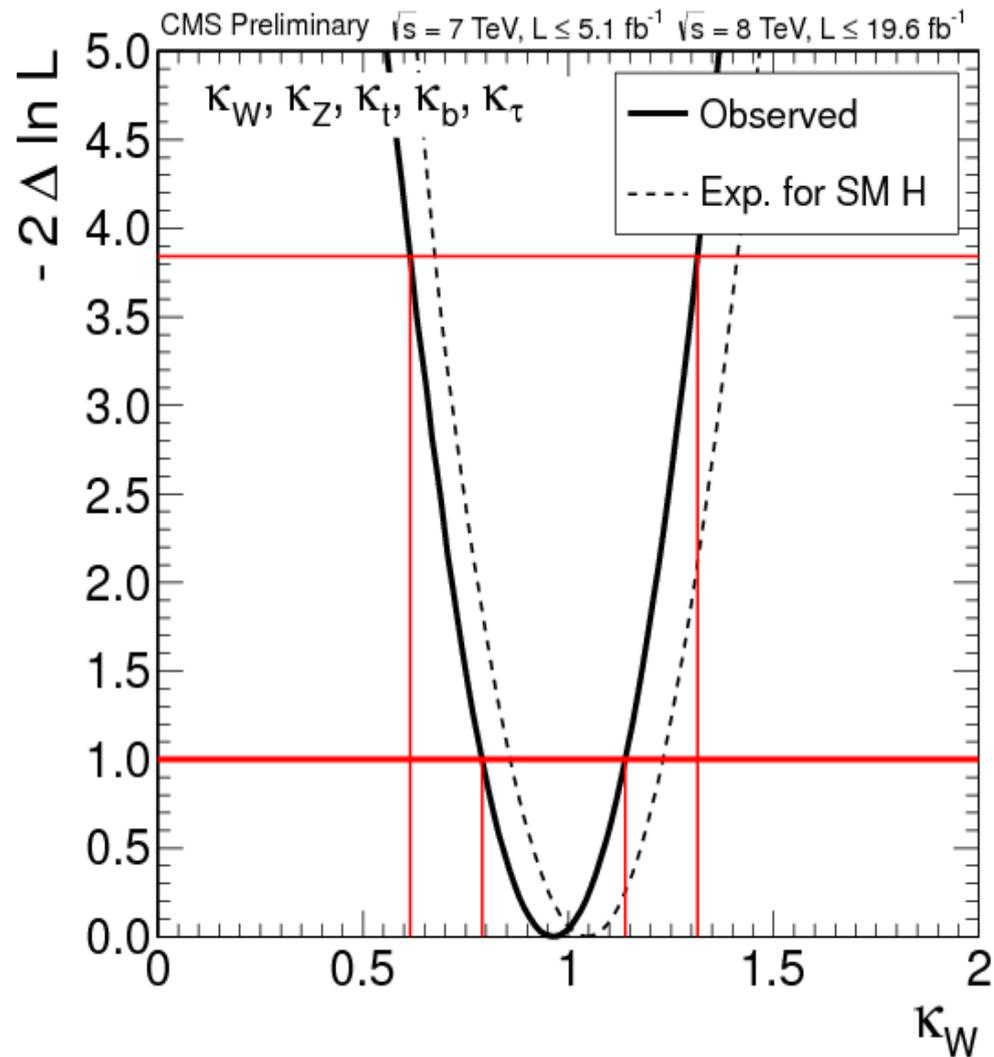

# Test of custodial symmetry

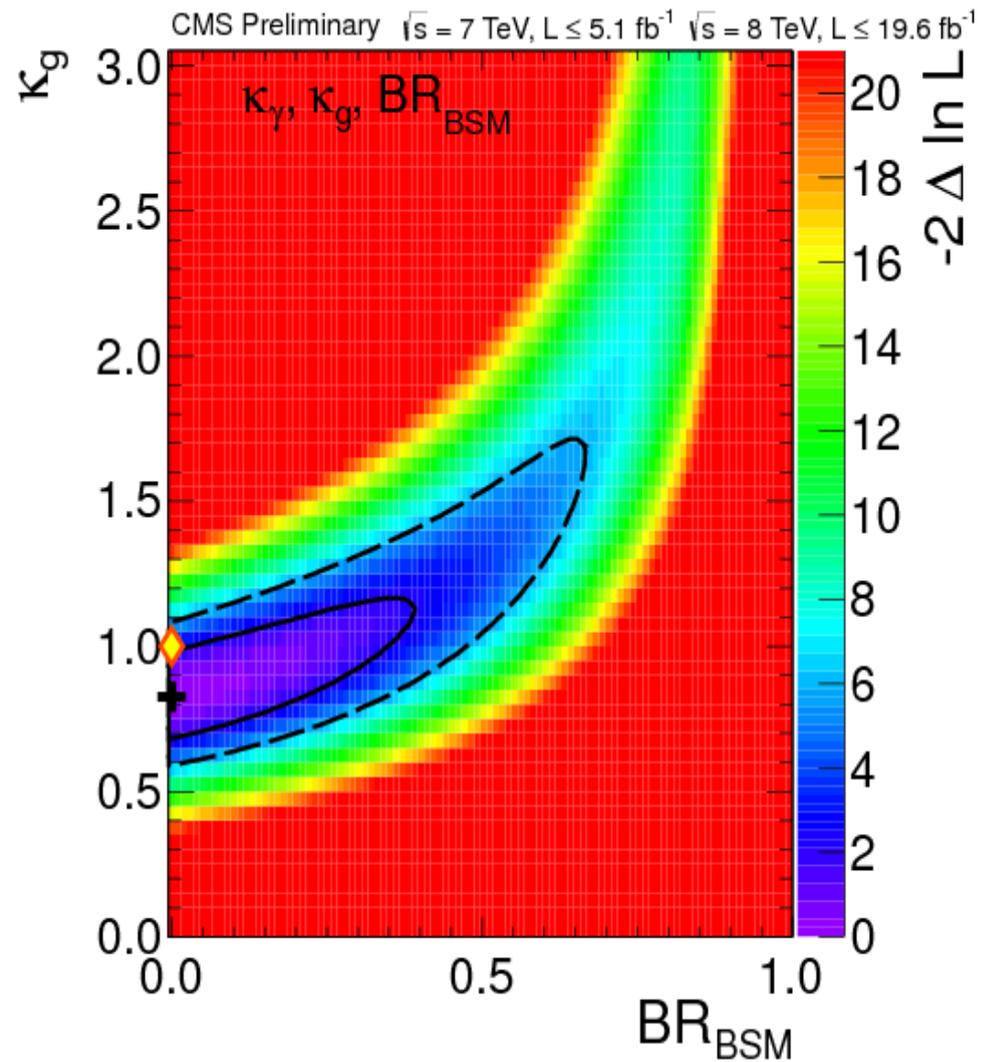

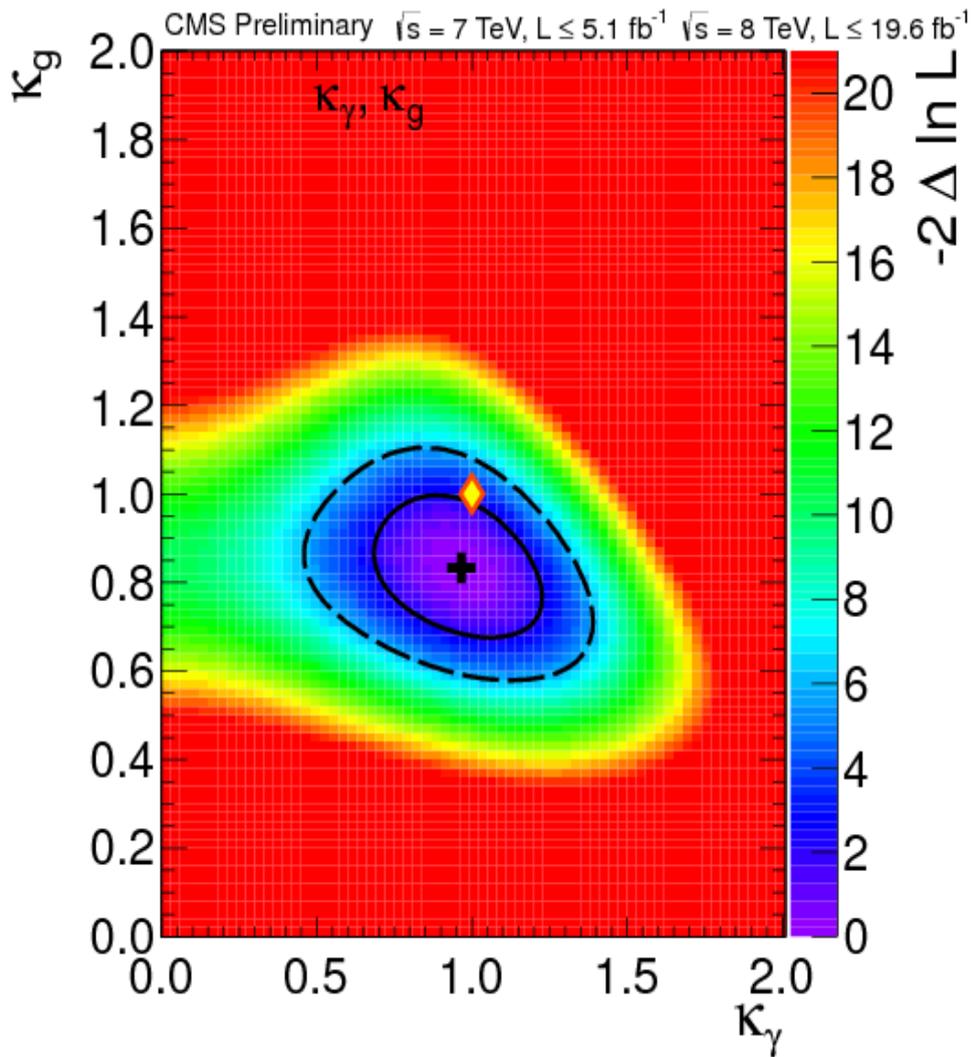

# Generic search for deviation from SM

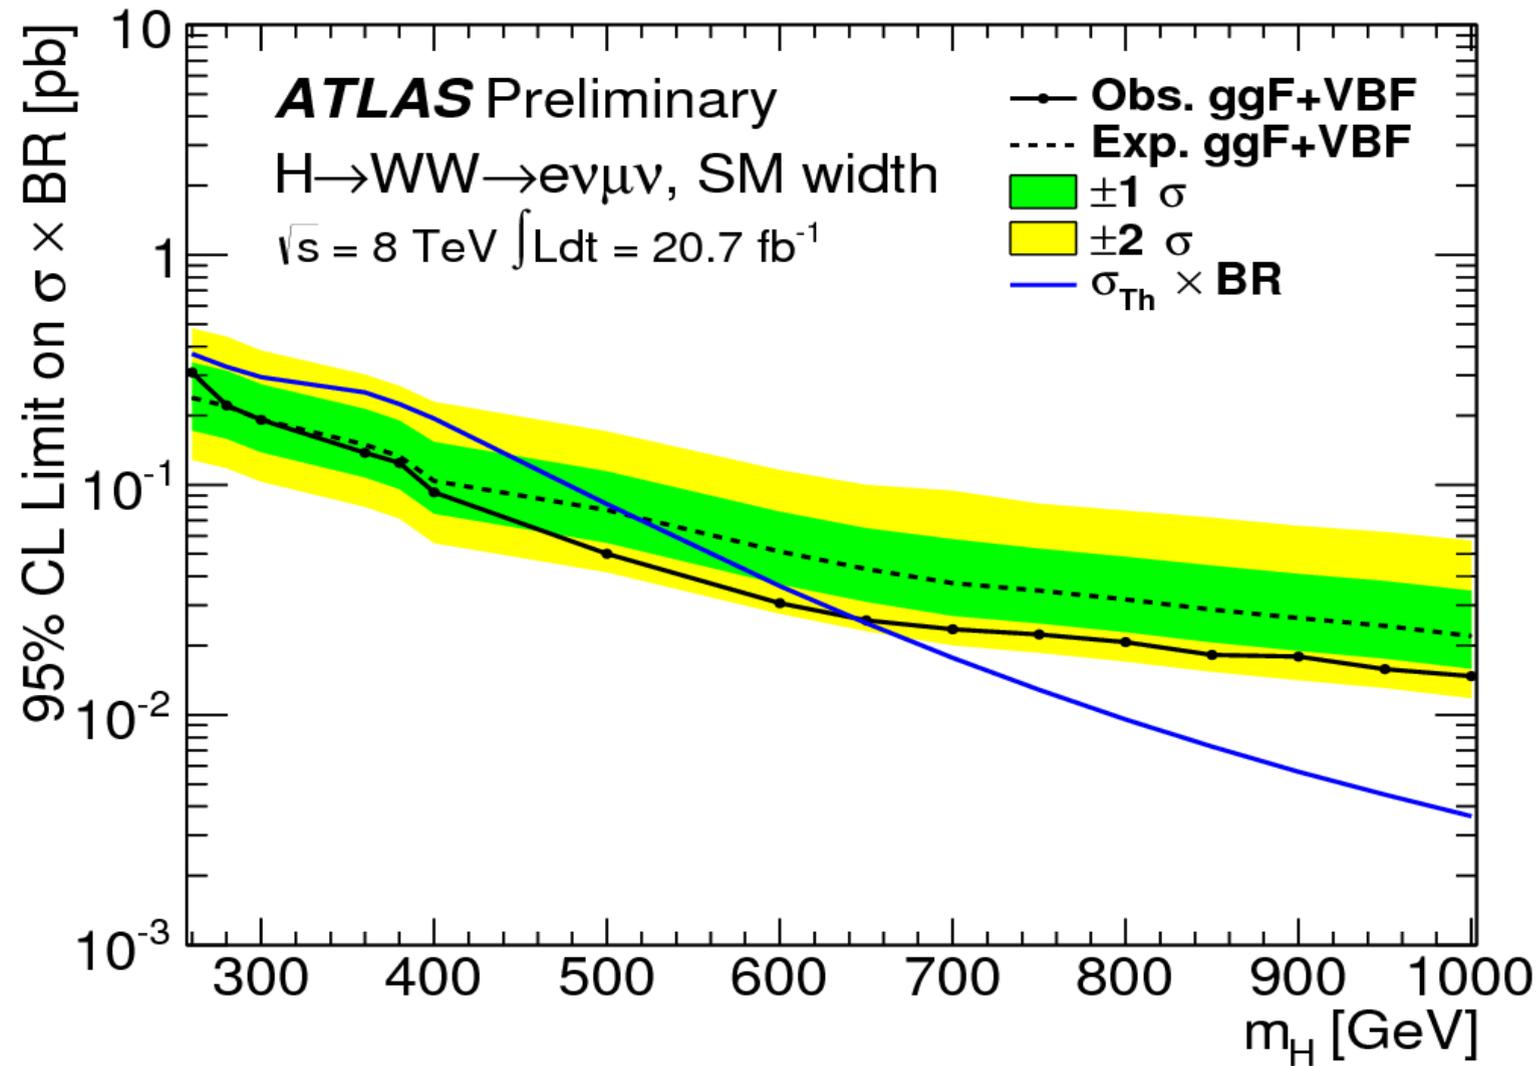

by profiling the other coupling modifiers

# Search for new physics in loops

# High-mass searches: an example

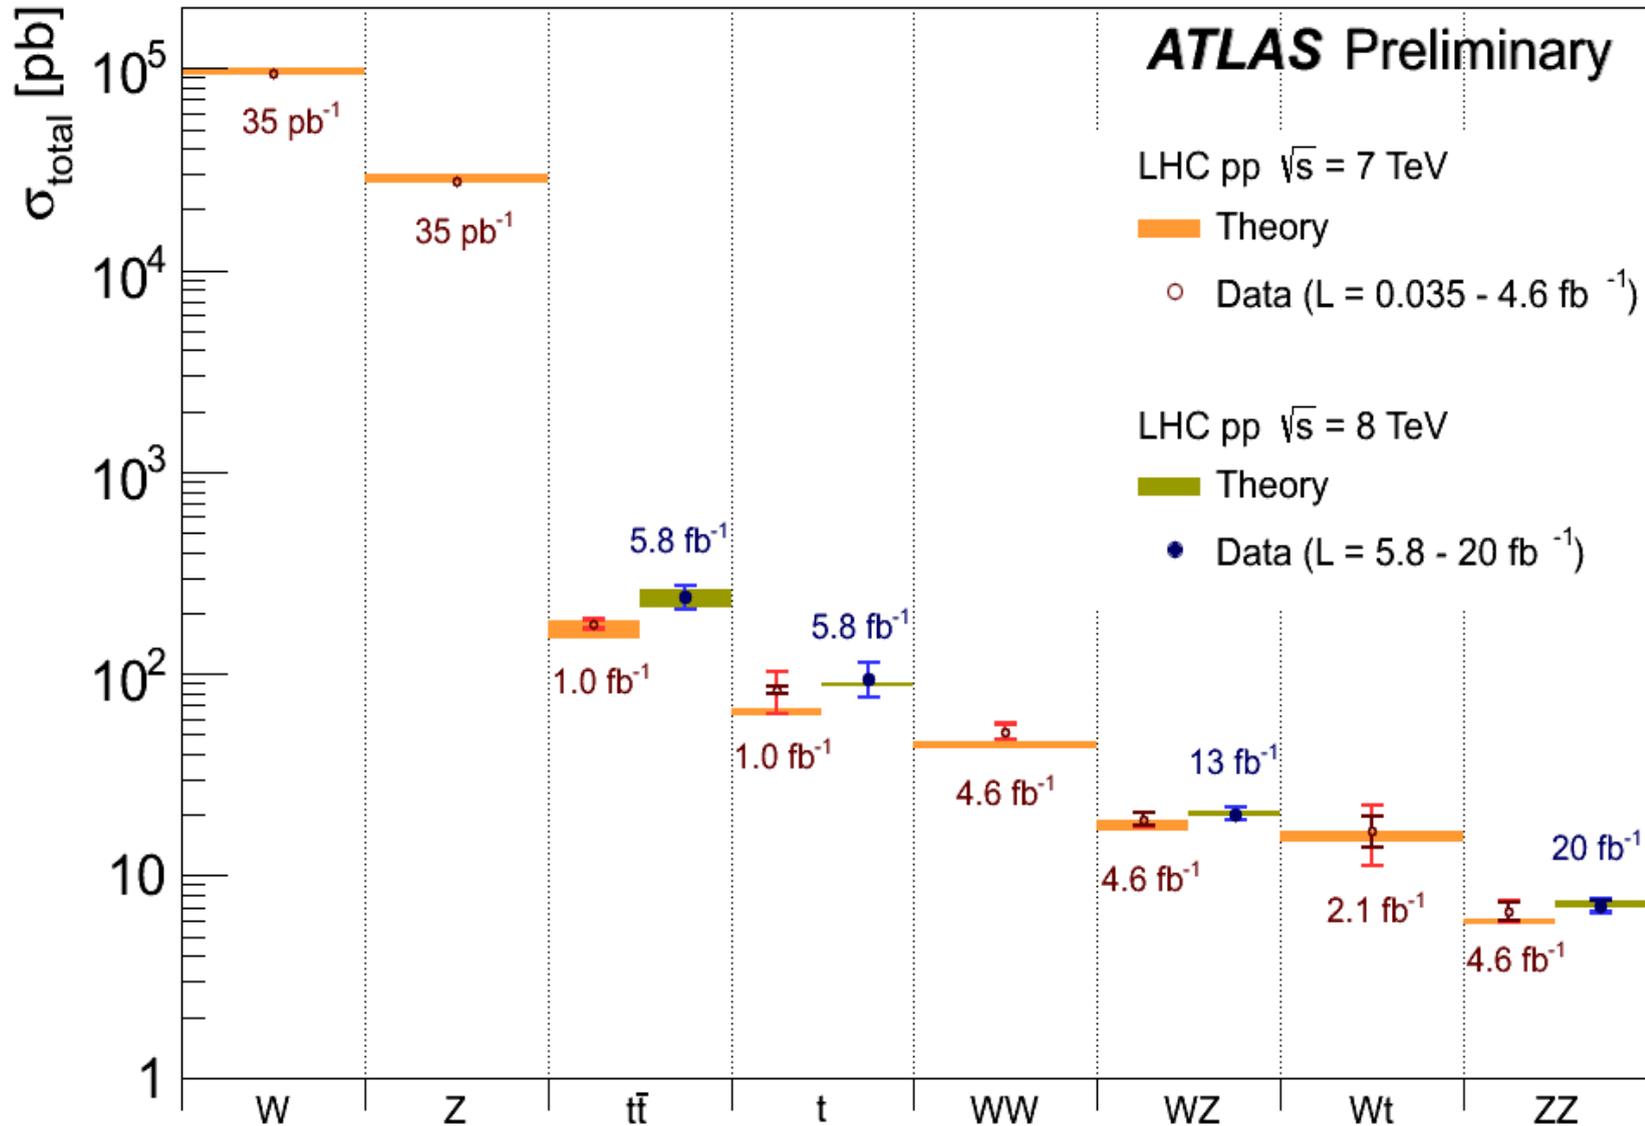

# The $\mu$ -problem of SUSY

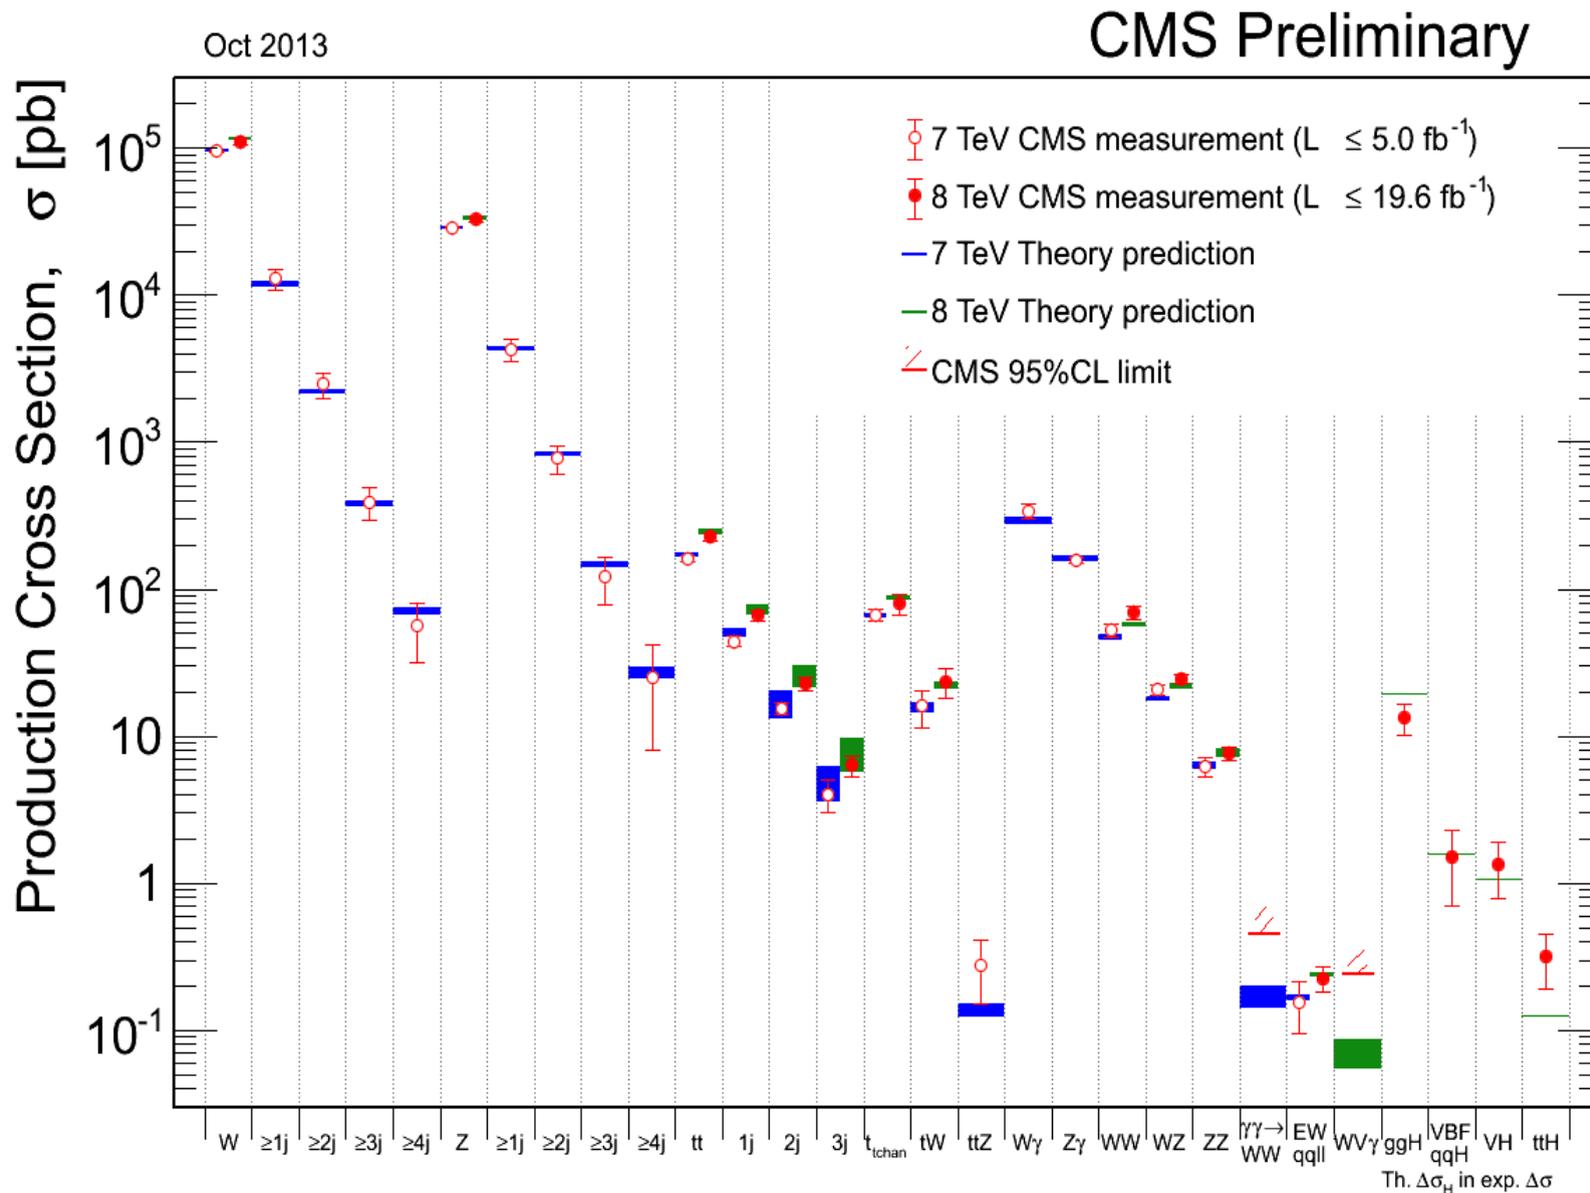

$$W_{\text{MSSM}} = \hat{Q}\hat{H}_u\mathbf{h}_u\hat{U}^C + \hat{H}_d\hat{Q}\mathbf{h}_d\hat{D}^C + \hat{H}_d\hat{L}\mathbf{h}_e\hat{E}^C + \mu\hat{H}_u\hat{H}_d$$

- $\mu$  is in the superpotential, so it is present before supersymmetry breaking (via soft terms).  $\mu$  should know nothing about the electroweak scale.
- If  $\mu = 0$  then there is no mixing between the two Higgs doublets. Any breaking of electroweak symmetry generated in the up-quark sector (by  $M_H^2 < 0$ ) could not be communicated to the down-quark sector. The down-type quarks and leptons would remain massless.
- If  $\mu = M_{\text{Planck}}$  then the Higgs bosons and their higgsino partners would gain Planck scale masses, in contradiction with upper bounds from triviality and precision electroweak data.
- For phenomenologically acceptable supersymmetry, the  $\mu$ -parameter must be of the order of the electroweak scale.
- One way to link the  $\mu$ -parameter with the electroweak scale is to make it a vacuum expectation value. Introduce a new iso-singlet neutral colorless chiral superfield  $\hat{S}$  coupling together the usual two Higgs doublet superfields. The scalar part of this is  $\lambda S H_u H_d$ . If  $S$  gains a vacuum expectation value we generate an effective  $\mu$ -term.  $\rightarrow$  NMSSM

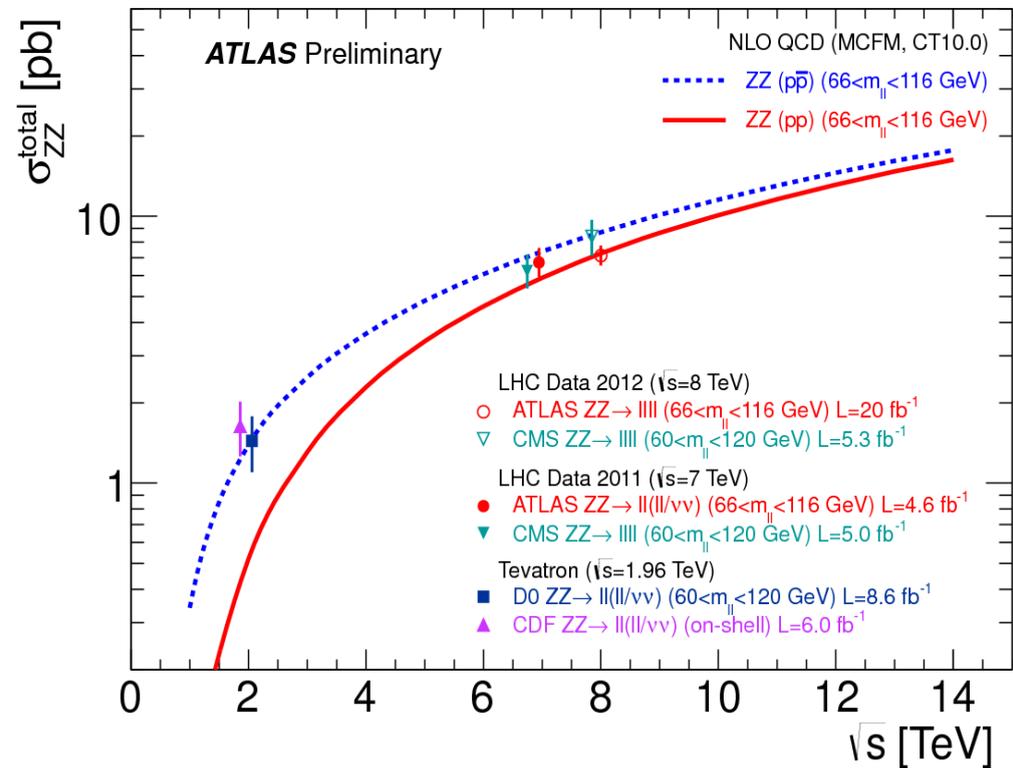

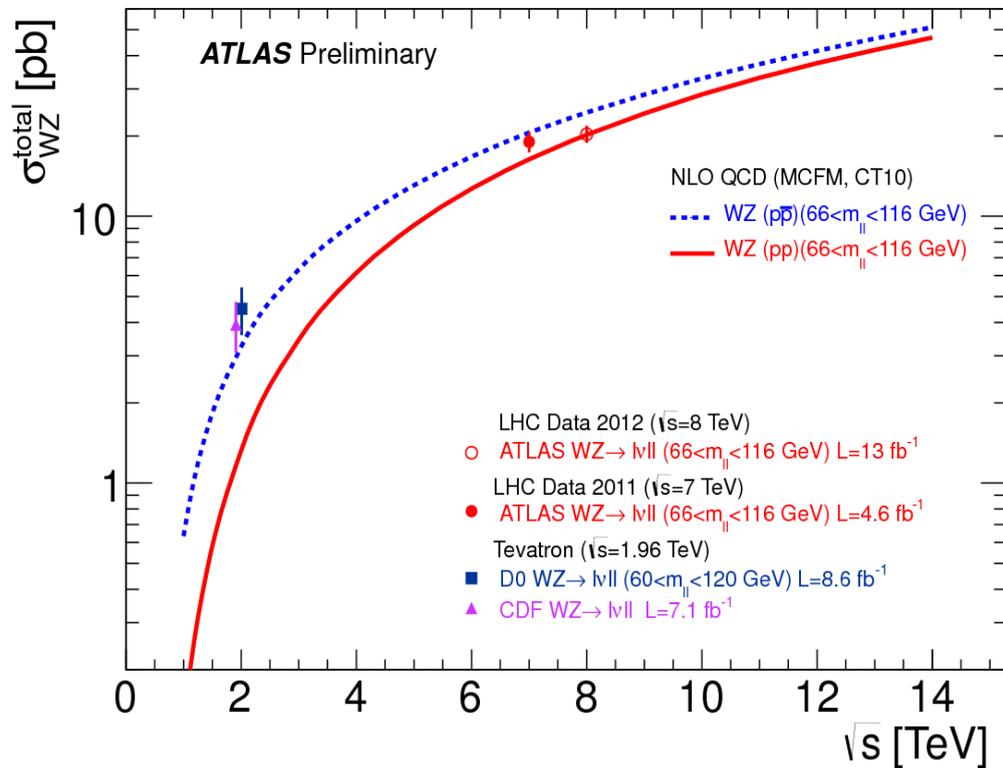

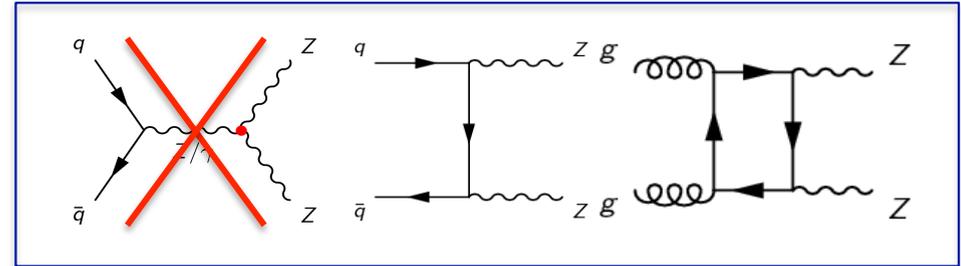

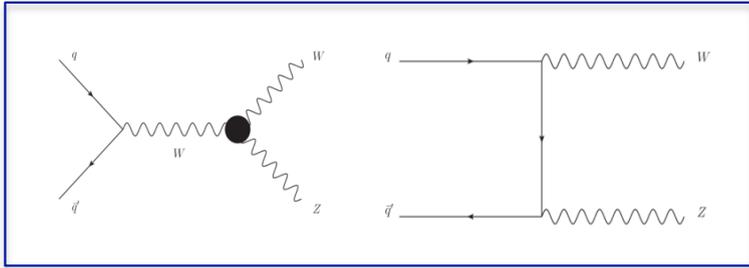

# The SM strairway

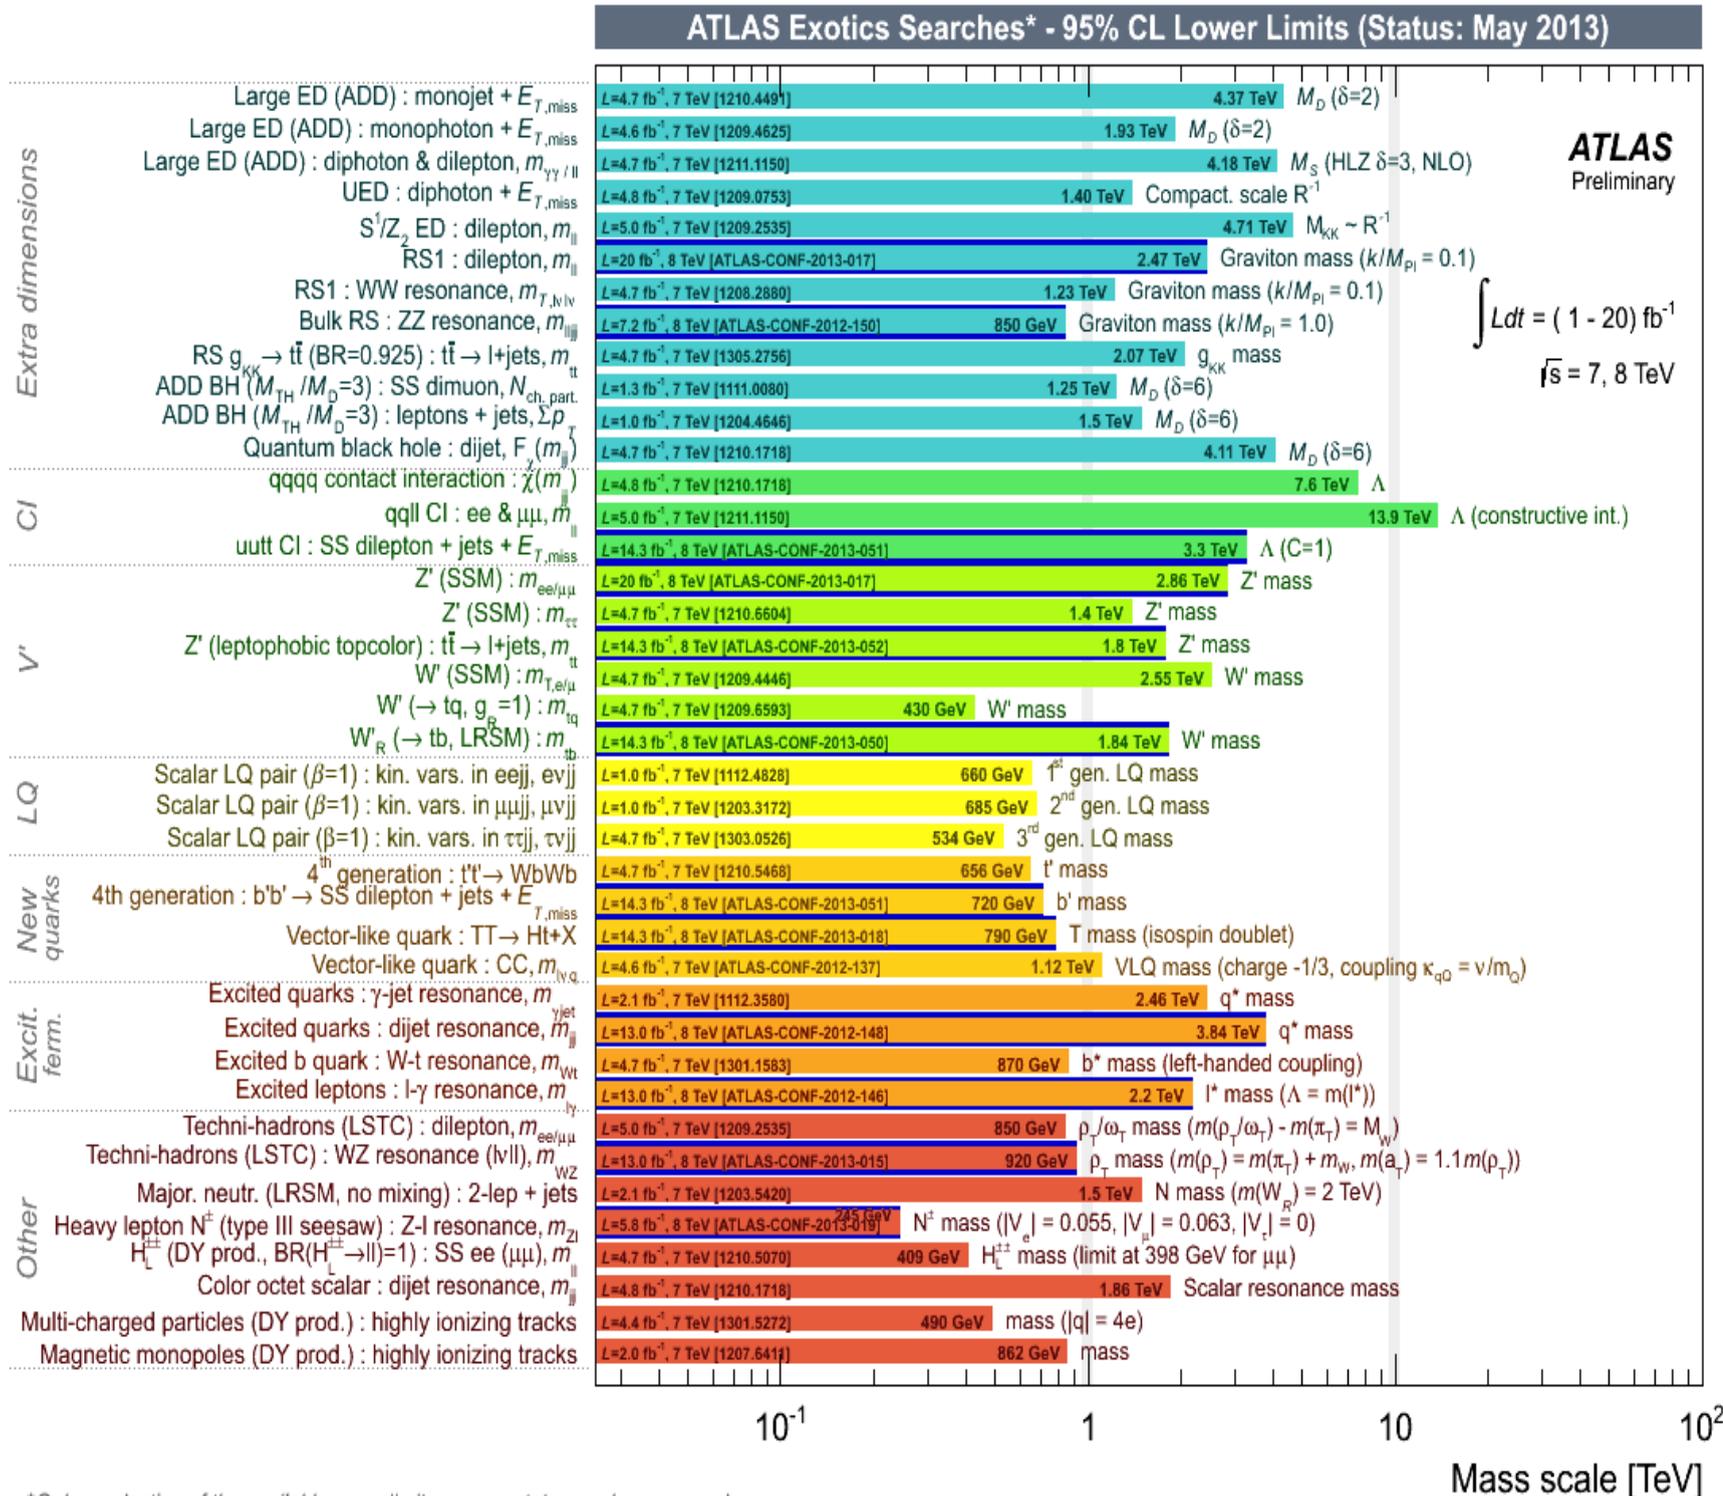

# The SM strairway
