Questions / Answers

Definition of reliability

1st basic approach

$$\text{Reliability} = \frac{\text{Time the systems works} - \text{Time of breakdowns}}{\text{Time the system works}}$$

Definitions of reliability

The reliability is the ability of a system or component to perform its required functions under stated conditions for a specified period of time

The reliability ($R(t)$) is the probability to have no failure at the time t .

MTBF: *Mean Time Between Failures*

MTTR: Mean Time To Repair

The availability of the system is the ratio of the time when the system is operational by the time it was supposed to be operational

$$\text{Availability} = \text{MTBF} / (\text{MTBF} + \text{MTTR})$$

What is the product (service) delivered ?
What is the quality defined ?
Who is defining the reliability ?

Reliability and Particle Accelerators

- **Power- Energy & Motion**

Electricity, cooling, regular motion systems

- **Critical and/or sensitive Technologies**

Radio-Frequency, vacuum, electronics, cryogenics, software, ...

- **Risks**

radiation-protection, costs, ...

- **Complexity**

Development – the V cycle

contract

Contracting with

With the provider of the accelerator

- performances and acceptance tests (conservative / innovation)
- contents and limits of interface (beam, building , control, ...)
- training - documents
- budgets (bonus / penalties)
- maintenance

With the provider of building and ancillaries

Contracting with

With the provider of the accelerator

- performances and acceptance tests (conservative / innovation)
- contents and limits of interface (beam, building , control, ...)
- training - documents
- budgets (bonus / penalties)
- maintenance

With the provider of building and ancillaries

With the users (« real » needs, constraints, freedoms, evolutions...)

With the payers (budget and resources)

- for investment
- for ramp-up and contingencies
- for operations, maintenance, ...

Science of Organisations

Henry Mintzberg: different kinds of coordination

- **Mutual adjustment**
- **Direct supervision**
- **Standardization of work processes**
- **Standardization of outputs**
- **Standardization of skills**
- **Standardization of norms**

Life-cycle of an accelerator

RAMI approach (Reliability, Availability, Maintainability, Inspectability) for project IFMIF

Enric Bargalló – IFMIF RAMI Team

Concepts and reliability

Principles to increase reliability:

- Redundancy
- accessibility
- over-engineering
- maintainability
- ...

Parameters increasing risks on reliability

- Technological innovations
- Lonely experience
- Number of specific interfaces
- pressure on quality, budget, delay
- ...

MYRRHA

- ADS (Accelerator Driven System) pour la transmutation des déchets radioactifs
- Multi-Purpose hybrid Research Reactor for High-tech Applications (SCK), horizon ~2023
- Challenge #1 : faisceau CW multi-MW : 2.5 mA (4 mA to compensate burn-up), 600 MeV
- Challenge #2 : fiabilité extrême : moins de 10 trips > 3 s pendant 3 mois !!

• Injecteur redondant

- "fault-tolerance" non applicable
- nb éléments minimisé
- injecteur "spare" avec aiguillage rapide

• Linac supra modulaire

- concept valable demo → transmuter
- éléments contrôlés indépendamment
- fault-tolerance : élt défaillant remplacé par ses voisins

Life-cycle of an accelerator

The (wellknown) recipes for a good reliability

A system (hardware & software) well designed

- specifications, model of developpement, tests
- principles of reliability, a lot of diagnosis

A well-maintained system

- Preventive, real, adaptative, reactivity for corrective
- Spare parts (a lot, ready for use)
- time dedicated for operations

Human resources and good organization

- people trained, skilled, enough, here when required
- efficient and clean organization, data-base, Knowledge Management

Briefly: resources (men, budget), consistency, willingness...

Example on life-cycle the AGOR cyclotron

A large, complex superconducting cyclotron machine, the AGOR, is shown in a laboratory setting. The machine features a large blue cylindrical central region, surrounded by various metal structures, pipes, and electrical components. A white metal platform with railings is positioned above the central area. The background shows a concrete wall and some orange-colored structural elements.

AGOR

Super-conducting cyclotron 200 MeV

Based on Design of Institut Physique Nucléaire-Orsay
Built and tested at Orsay
Installed at KVI (Groningen –Netherlands)

1st beam @ KVI: 1996

Basic design: All ions
 200 MeV pol p and d
 100 MeV/n $Z/A=0.5$

10 MeV/n $Z/A=0.1$

AGOR Few numbers

| | |
|---|--------------------------|
| Weight | 320 T |
| Height | 4 m |
| Diameter | 4.4 m |
| Magnetic field | 4.05 - 1.75 T |
| RF | Amplitude 50 KV to 90 KV |
| 33 Kms of supraconducting wires | |
| 250 l of liquid He (-269°C) | |
| 50 Millions Joules stored energy in SC oils | |
| 1 MW Installed power | |
| 400 T Attracting force on the poles (2/10 mm) at 4T | |

Protons beam at 200 MeV

$$V = \frac{1}{4} C$$

1.2 km

Some features of the project

1. Expected results in terms of range of particles
2. Cyclotron built at Orsay and re-installed at KVI
3. Small leak in the cryostat
4. New concept: coils + vacuum systems (Heat pipes)

AGOR

AVAILABLE BEAMS FOR PHYSICS

END 1997

Quality

Delay
1991->1994

Cost
Limit /year

Some features of the project

1. Expected results in terms of range of particles

OK for results – 3 years of delay

2. Cyclotron built at Orsay and re-installed at KVI

OK : mix team IPNO-KVI from the beginning

3. Small leak in the cryostat

NOK : a persistent trouble during first years

4. New concept: coils + vacuum systems (Heat pipes)

OK : good management of R&D on innovation

3. some paradoxes about reliability (for accelerators)

Some paradoxes about reliability

**In order to obtain the maximal reliability,
this thematic must be considered by all.**

**A permanent and rational approach will
permit to reach the expected results.**

Some paradoxes about reliability

In order to obtain the ~~maximal~~ reliability,
this thematic must be considered by all.

The maximal reliability
is an utopia

To be defined, means
necessaries, associated
costs...

nal approach will
expected results.

**Cyclotron PSI (590 MeV)- CH
designed for 100 μ A (1974)
an now at 2,2 mA (2012)**

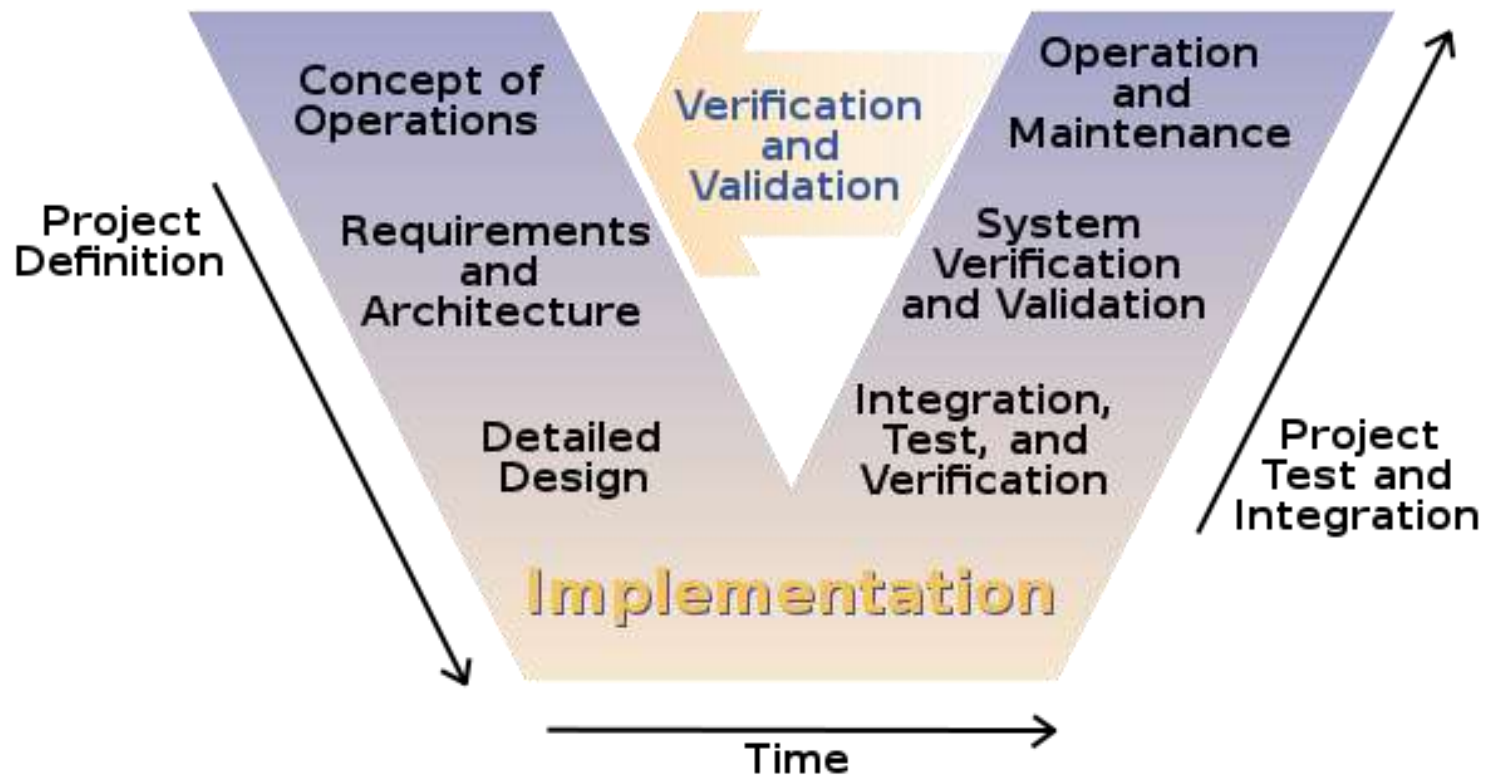

Summary

Reliability and accelerators

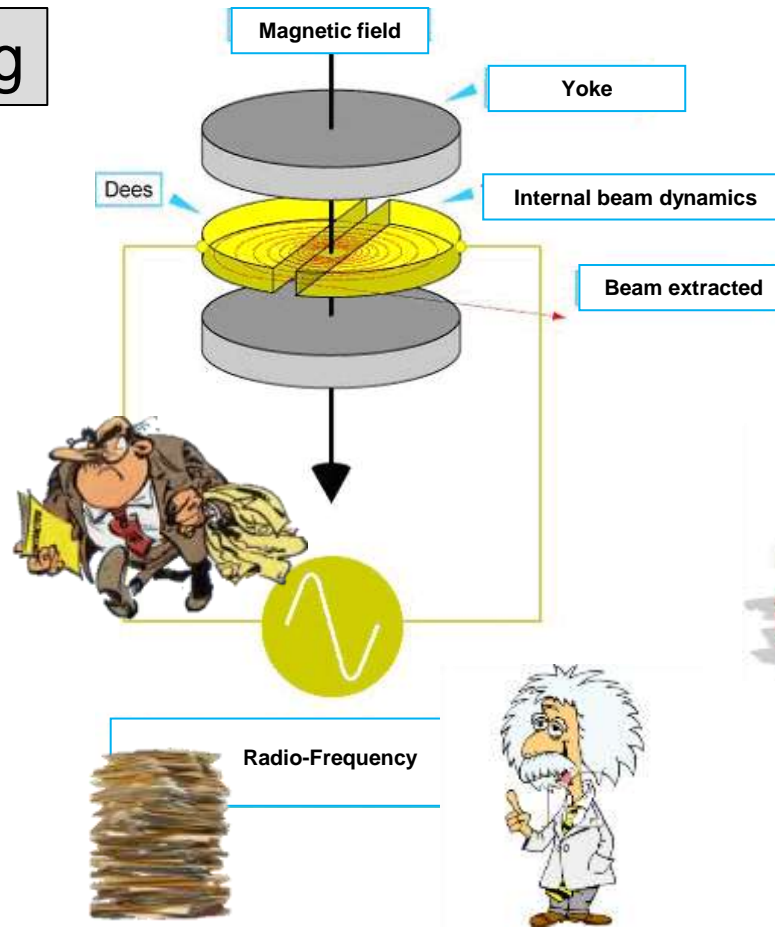

- **Concepts:** principles to increase reliability, risks to consider
- **Definition :** Importance to agree on (what, how, mode, constraints/freedoms, ...)
- **Maintenance:** % determinist (mechanical, cooling, ...) % based on monitoring (systems + organisations)
- **Responsabilities:** to establish and clarifiy (systems, organization, Quality assurance, test, ...)
- **Information:** how to get as soon as possible (other experiences, test, ...), how to keep during the life of accelerator.
