## ***automatic geoinfo monitoring and analysis***

- Illegal crop eradication monitoring (poppy, coca)
- Conflict modelling, border permeability modelling
- Kimberley process support (diamond certification schema)
- Post-conflict situation awareness, damage assessment
- Vulnerable population monitoring (refugees/IDP camps)
- Urban poor (slum) analysis and monitoring
- Disaster management information support (risk, mitigation, damage assessment, reconstruction)
- Regional Planning
- Global Human Settlement Layer (GHSL) initiative
- **Remote Sensing Image Information Mining**

# Image Information Mining Challenges

- Unstructured heterogeneous data, large volume
- Uncontrolled data collection parameters
- Large data gaps, atmosphere influence
- Data degradation (compression, fusion)
- Undocumented sensor tolerances, spatial inconsistencies
- Heavy image processing tasks
  - Radiometric, textural, morphological criteria
  - Background/foreground ambiguity
  - Multi-scale, contextual and geometrical analysis
- Complex interpretation schemas
  - Multi-level abstraction semantics
  - Multi-scale and dynamic phenomena

# REMOTELY SENSED IMAGERIES AND INFORMATION GATHERING

**moving objects**

Figure 3 – estimated velocity of targets overlaid on the PAN image. Red, green and blue targets were classified as “moving”, “unknown”, and “non-moving”, respectively, by visual inspection.

people

N'Djamena, Chad: 4<sup>th</sup> February 2008 at 10h30 UTC. Recognition of people escaping from the conflict area (up in the image) and trying to reach the territory of Cameroon on the other side of the river (bottom in the image). The data used was collected by the sensor onboard of the "Worldview1" satellite with a panchromatic optical channel having 50 centimeters of spatial resolution. The information about presence of people on the ground (represented in pink in the image) was extracted and fused using automatic image information mining methodologies designed and developed by JRC.

Proof of concept 1<sup>st</sup> operational test 2012

Big Data Analytics, Remote Sensing

Total 11438 panchromatic and multispectral satellite data sets from several different sensors. (*SPOT 2 and SPOT 5, RapidEye, CBERS-2B, QuickBird-2, GeoEye-1, WorldView 1 and WorldView 2. Airborne data sets covering large areas were available as RGB imagery*).

Tested resolutions: **from 0.5 to 10 meter**

Tested Radiometry: the entire visible and near infrared part of the spectrum.

Tested Data Heterogeneity: more than 50 combinations of bands, bit depth and compression formats.

Test size: total mapped surface of more than **24 millions of km<sup>2</sup>**. (16% of the global landmass)

Input data volume: in the order of **4.00+12 picture elements** (pixels), stored in approximately **30Tbyte**

**What is lost with LR input data**

# EU HR GHSL

Input: CORE003 data 2012 from the GMES/COPERNICUS program,  
Spot PSH 2.5 m R-G-IR, no calibration, no metadata  
Output: 2.5 m resolution GHSL

Input Volume: circa 20 TB

New GHSL features:

1. Better output resolution = inner built-up patterns
2. Open spaces analysis, vegetation

Status: production completed June 2013 (alpha) and Oct 2012 (beta) in support to DG REGIO cohesion policy report 2014, publication results planned 2014

## Global Human Settlement Layer

The Global Human Settlement Layer (GHSL) is developed and maintained by the JRC

The GHSL proposes a new way to map, analyze, and monitor human settlements and the urbanization in the 21st century. GHSL integrates several available sources reporting about the global human settlement phenomena, with new information extracted from available remotely sensed (RS) imageries. In fact, the GHSL is the largest and most complete known experiment on automatic image information retrieval using high and very high remotely sensed image data. The GHSL outcome is a human-made extrinsic or work on integration of multi-platform, multi-sensor (pan, multispectral), and multi-temporal image data.

<http://ghslsys.jrc.ec.europa.eu>

The GHSL is an evolutionary system, with the aim of stepwise improving completeness and accuracy of the global human settlement description by offering free services of image information retrieval in the frame of collaborative and derived-contents sharing agreements.
