Charms and prompt photons production with the event generator EPOS

Tuesday 9 September 2014 14:35 (30 minutes)

EPOS is an event generator using a unified formalism for the description of p-p, p-A and A-A collisions. Recently, prompt photons and charms have been implemented. One of our aims is to use this work for the study of the Quark-Gluon Plasma. After a short presentation of EPOS formalism, our results for pp collisions will be presented.
