Recent quarkonia results from the PHENIX experiment at RHIC

Tuesday 9 September 2014 10:15 (40 minutes)

The measurement of quarkonia production in relativistic heavy ion collisions provides a powerful tool for studying the properties of the hot and dense matter created in these collisions.

To be really useful, however, such measurements must cover a wide range of quarkonia states, collision energies and colliding species.

In this talk I will present recent results from the PHENIX collaboration on quarkonia production in different nucleus-nucleus collisions at various energies in a wide rapidity range, their interpretation, and comparison to p+p collisions.
