Outline

1. Motivation

- importance of particle correlations at high-p_T

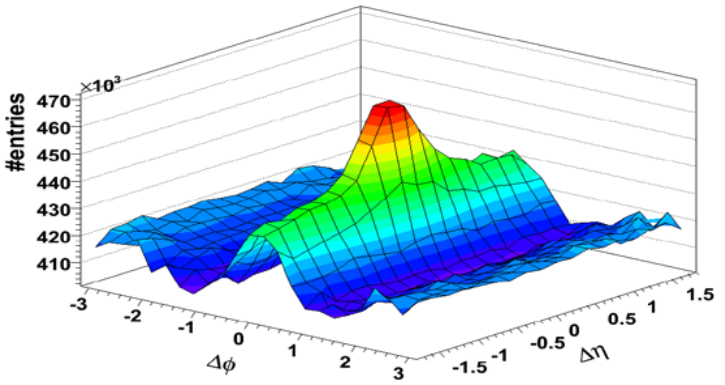
2. Monte Carlo studies of two-particle correlations in terms of quantum number conservations

- Focusing on identified associated particle spectra
- Identified particle yields from like-sign and unlike-sign correlations
- Comparison of triggered relative yields in p-p, Pb-Pb and p-Pb
  - Collision energy (p-p)
  - Event multiplicity (p-p)
  - Centrality (Pb-Pb)

3. Summary, Outlook

1. Importance of particle correlations at high p_T

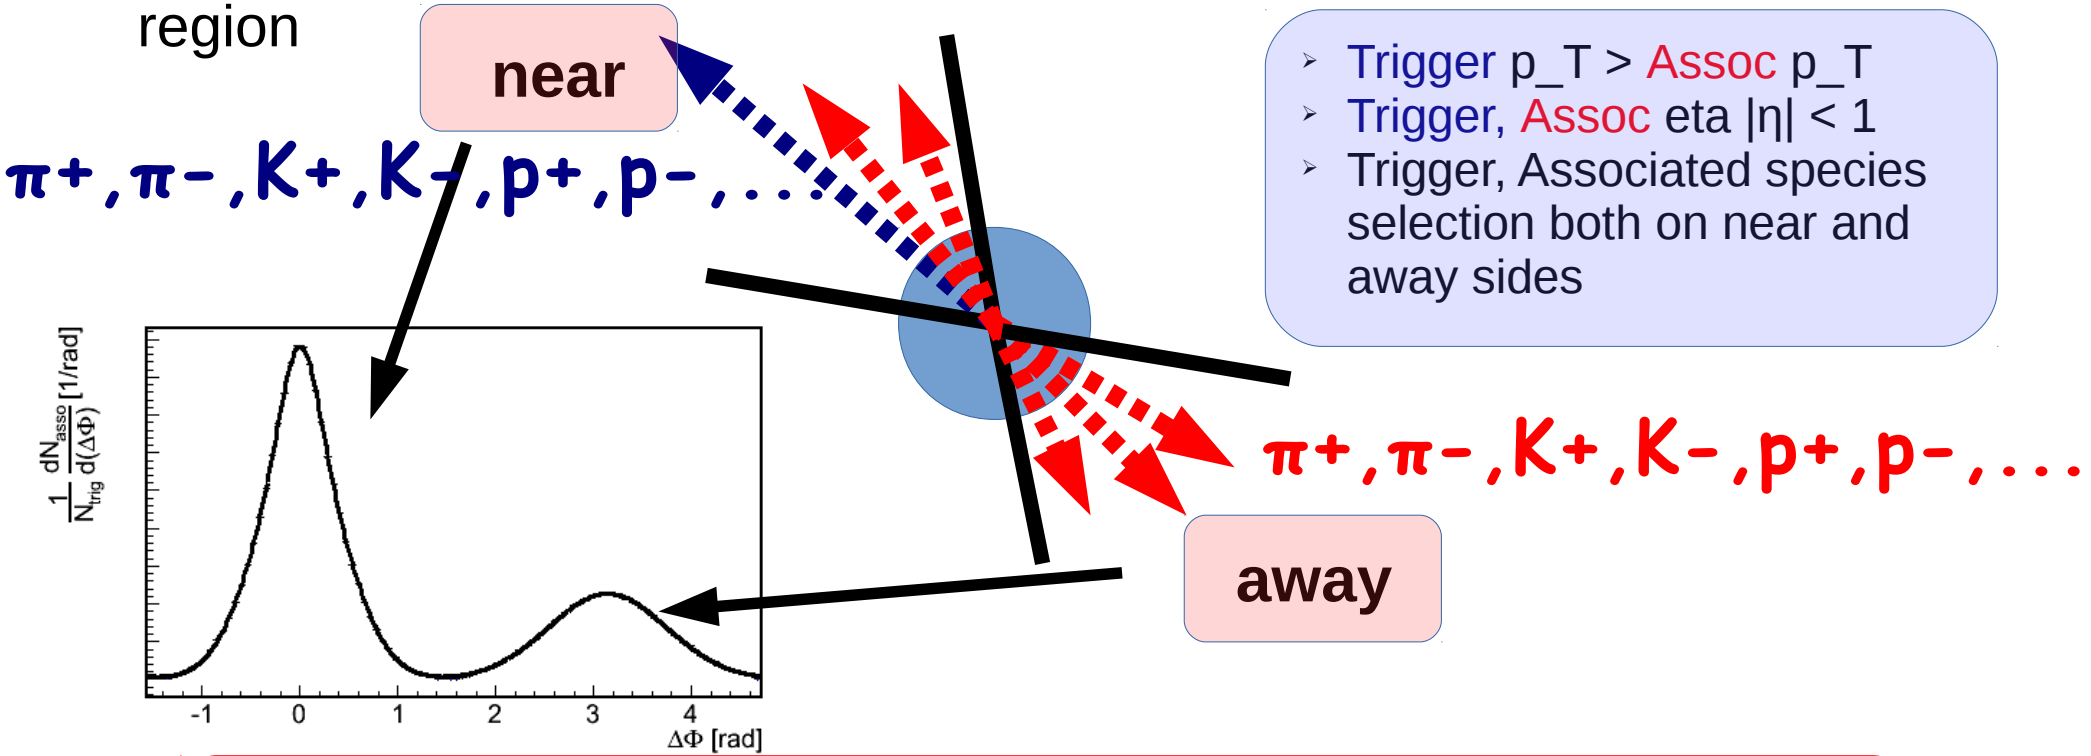
- Hadronization in QGP
  - High-p_T hadrons, particle ratios, collective effects
  - High-p_T factorization holds: PDF x pQCD x FF + jet quenching HI (PID?)
  - Intermediate p_T: recombination rises
- Fragmentation effects, including PID: recombination effects in intermediate p_T (R_{CP},$R_{AA,}$Barion/Meson,v_2)
- Jet-like correlations: ridge (AuAu,dAu,pPb)
  - PID could shed light on formation mechanism...



1. Importance of particle correlations at high p_T

Identified two-particle azimuthal correlations

- Identified **triggers**, identified **associateds** integrated in mid-rapidity region



- Trigger p_T > Assoc p_T
- Trigger, Assoc eta |η| < 1
- Trigger, Associated species selection both on near and away sides

Expectation: conservation of quantum numbers

π,K,p – momentum p, charge Q (+K strangeness, +p baryon number)

Fragmentation / hadronization for different particle flavours

2. Quantum number conservation in correlations

Monte Carlo datasets and analysis cuts

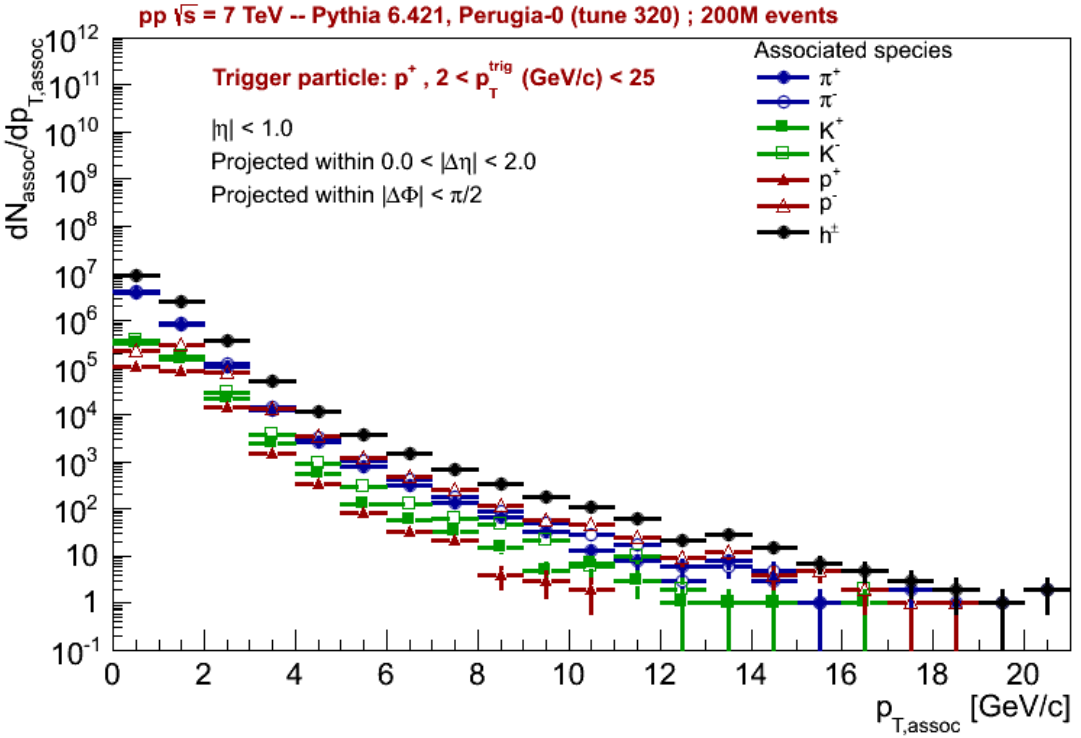
Collision system	$\sqrt{s}$ ($\sqrt{s_{NN}}$)	Statistics
p-p	14 TeV	500 M
p-p	7 TeV	100 M
p-p	2.76 TeV	100 M
p-p	200 GeV	500 M
Pb-Pb (0-10%)	2.76 TeV	4 M
Pb-Pb (30-40%)	2.76 TeV	2 M
Pb-Pb (80-90%)	2.76 TeV	10 M
p-Pb (min.bias)	5.02 TeV	10 M

- p-p events generated by PYTHIA8 (tune 4C)
- Pb-Pb and p-Pb events generated by HIJING
- only charged, final-state particles ($\pi^{\pm}$, $K^{\pm}$, p, $\bar{p}$, and the charged hadrons ($h^{\pm}$)
- $|\eta_{trig}| > 1$ and $|\eta_{assoc}| > 1$ were rejected
- transverse momenta of the trigger particles selected within 2 GeV/c $< p_{T,trig} <$ 25 GeV/c
- $p_{T,assoc} < p_{T,trig}$ to avoid double counting
- p_T spectra were projected within $|\Delta\eta| < 1$

2. Quantum number conservation in correlations

Identified associated particle spectra I.

- PID-PID associated p_T spectra up to high-p_T
- p-p @ 7TeV, Pythia (tune320)
- Same side
- Example:
  Trigger particle: proton
  in $2 < p_T$ [GeV/c] < 25 range
- Associated: π+,π-,K+,K-,p,pbar
- Acceptance: |η|<1.



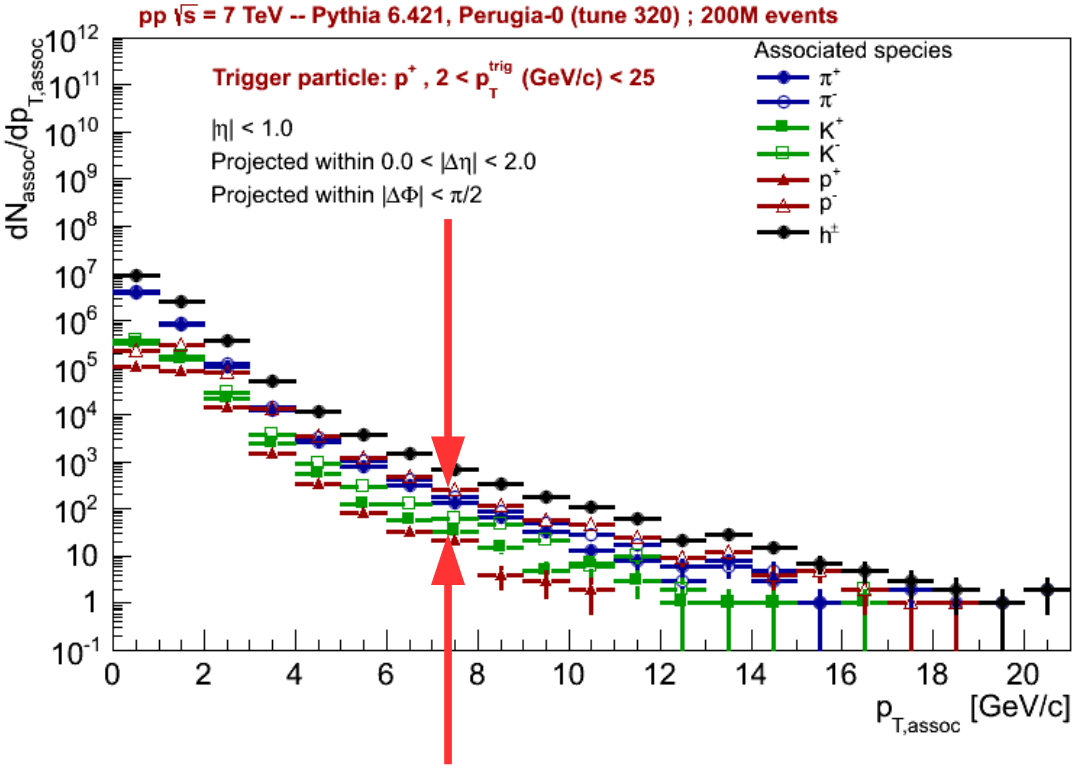
2. Quantum number conservation in correlations

Identified associated particle spectra I.

- PID-PID associated p_T spectra up to high-p_T
- p-p @ 7TeV, Pythia (tune320)
- Same side
- Example:
  Trigger particle: proton
  in $2 < p_T$ [GeV/c] < 25 range
- Associated: π+,π-,K+,K-,p,pbar
- Acceptance: |η|<1.

Observation:
differences between proton/anti-proton triggered associated yields

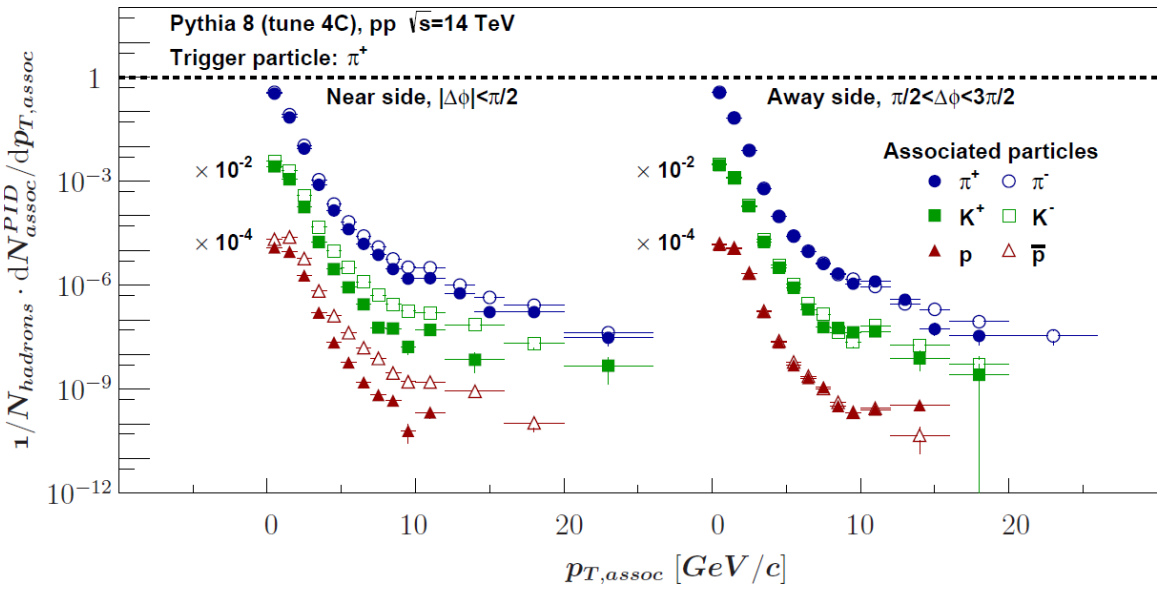
Strong effect on the near side



2. Quantum number conservation in correlations

Identified associated particle spectra II.

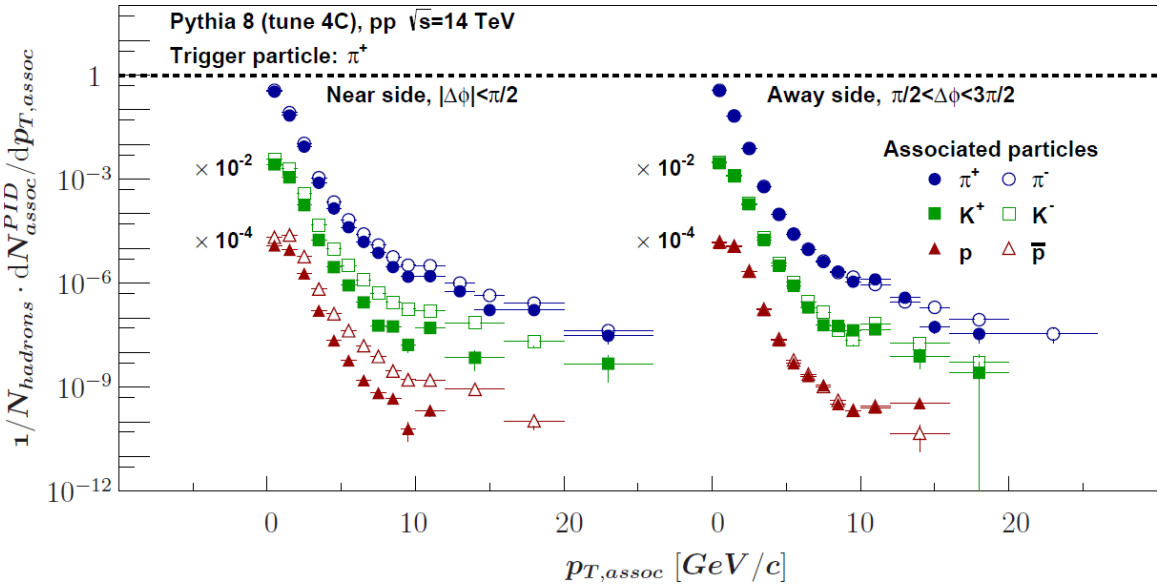
- Quantum number conservation can be tested by plotting the identified associated spectra for identified trigger hadrons
- Effect is on the near side
- The yields of the PID-associated spectra significantly decrease with the selection of charged pion, kaon and proton triggers, respectively
- The basic conservation laws of the quantum numbers – such as **charge (Q), baryon number (B), and strangeness (S)** – are fulfilled and could be reflected in the PID-associated spectra after the hadronization process



2. Quantum number conservation in correlations

Identified associated particle spectra II.

- Quantum number conservation can be tested by plotting the identified associated spectra for identified trigger hadrons
- Effect is on the near side
- The yields of the PID-associated spectra significantly decrease with the selection of charged pion, kaon and proton triggers, respectively
- The basic conservation laws of the quantum numbers – such as **charge (Q), baryon number (B), and strangeness (S)** – are fulfilled and could be reflected in the PID-associated spectra after the hadronization process.
- **Strength of the effects**



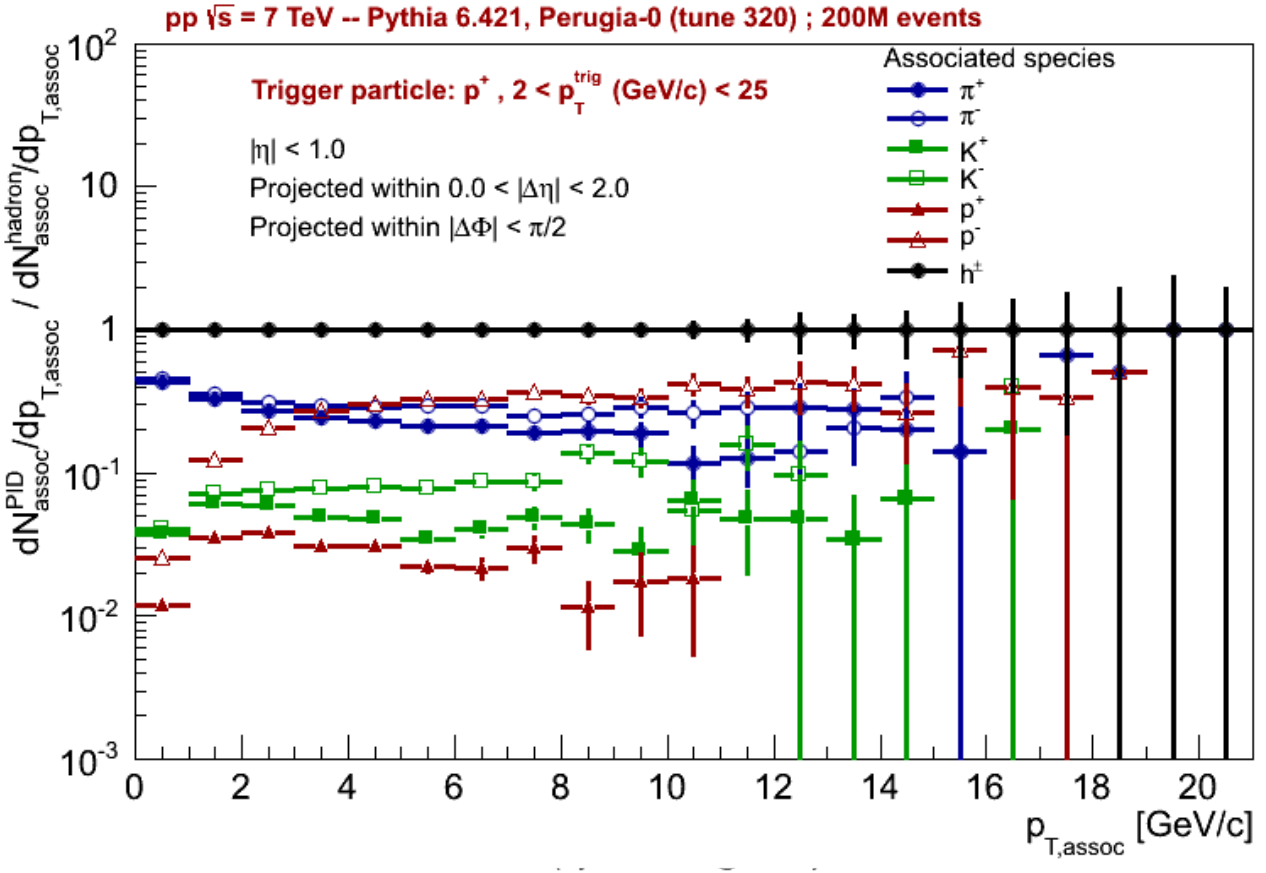
Trigger / Assoc	Strength of effect	
	Near side	Away side
π^+ / (π^+, π^-)	~ 2	~ 1
K^+ / (K^+, K^-)	~ 5	~ 1
p / $(p, \bar{p})$	~ 10	~ 1

2. Quantum number conservation in correlations

Identified associated particle ratios – a closer look

$$\frac{\frac{1}{N^{i}_{trig}} \times \frac{dN_{assoc}}{dp_{T,assoc}}}{\frac{1}{N^{j}_{trig}} \times \frac{dN_{assoc}}{dp_{T,assoc}}}, \qquad i \in \{\pi^{\pm}, K^{\pm}, p^{\pm}, h^{\pm}\}, \qquad j \in \{h^{\pm}\}$$

- **pp @ 7TeV, PYTHIA 6 (tune 320)**
- |Δφ| < pi/2, |Δη| < 2.
- Trigger particle: proton
  - in 2<p_T (GeV/c)<25
- Associateds:π+,π-,K+,K-,p,pbar
- Acceptance: |η|<1
- In an unmodified fragmentation process the baryon number and charge is conserved and leads to highly correlated distributions in the same phase space

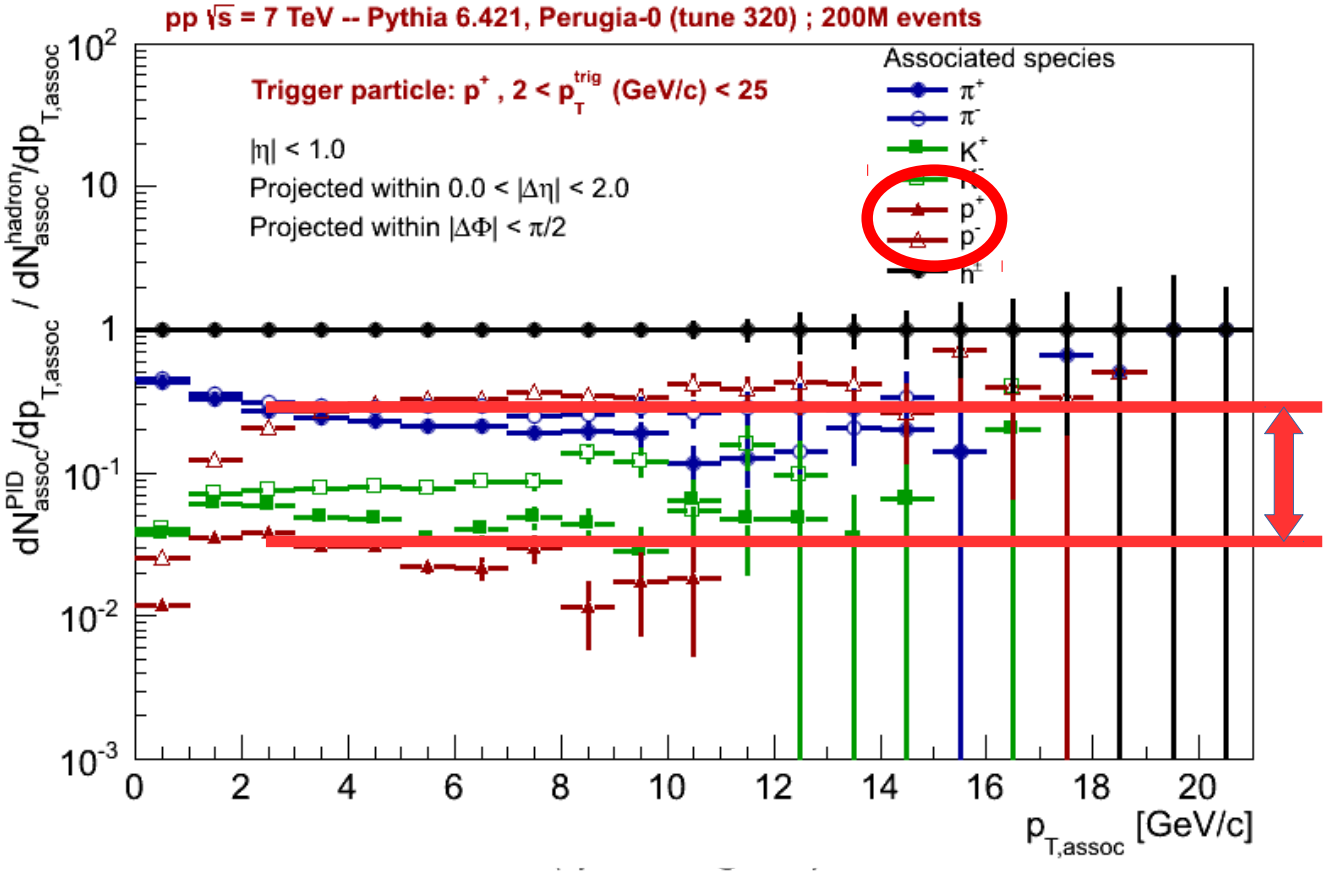


2. Quantum number conservation in correlations

Identified associated particle ratios – a closer look

$$\frac{\frac{1}{N^{i}_{trig}} \times \frac{dN_{assoc}}{dp_{T,assoc}}}{\frac{1}{N^{j}_{trig}} \times \frac{dN_{assoc}}{dp_{T,assoc}}}, \qquad i \in \{\pi^{\pm}, K^{\pm}, p^{\pm}, h^{\pm}\}, \qquad j \in \{h^{\pm}\}$$

- **pp @ 7TeV, PYTHIA 6 (tune 320)**
- |Δφ| < pi/2, |Δη| < 2.
- Trigger particle: proton
  - in 2<p_T (GeV/c)<25
- Associateds:π+,π-,K+,K-,p,pbar
- Acceptance: |η|<1
- In an unmodified fragmentation process the baryon number and charge is conserved and leads to highly correlated distributions in the same phase space



2. Quantum number conservation in correlations

Identified particle yields from like-sign and unlike-sign correlations in pp and PbPb collisions

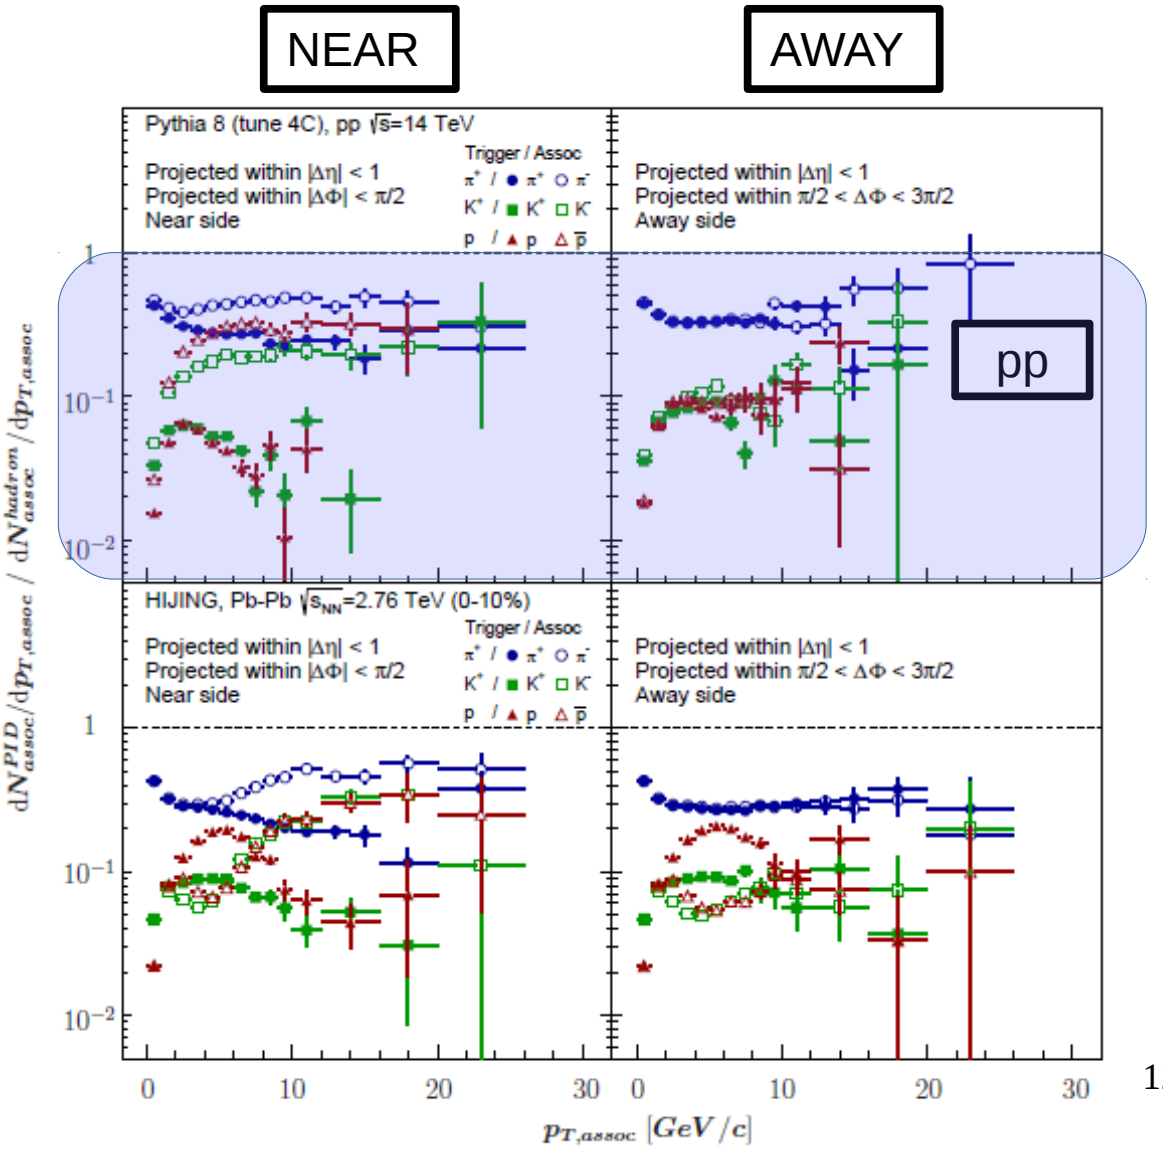
- To extract and enhance the expected quantum number conservation effects, the **ratio** of the PID-triggered-to-charged **hadron-triggered associated spectra** have been plotted

$$\frac{\mathrm{d}N^{PID}_{assoc}}{\mathrm{d}p_{T,assoc}} \Big/ \frac{\mathrm{d}N^{hadron}_{assoc}}{\mathrm{d}p_{T,assoc}}$$

- The splitting effect can be observed for any of the trigger species both in p-p and Pb-Pb collisions. The **splitting is larger on the near-side** than on the away-side.

- Qualitatively the strength of the quantum numbers:
  charge (Q) < strangeness (S) < baryon number (B)

- The **largest splitting** effect can be seen for unlike-sign correlations of **protons and antiprotons**.



2. Quantum number conservation in correlations

Identified particle yields from like-sign and unlike-sign correlations in pp and PbPb collisions

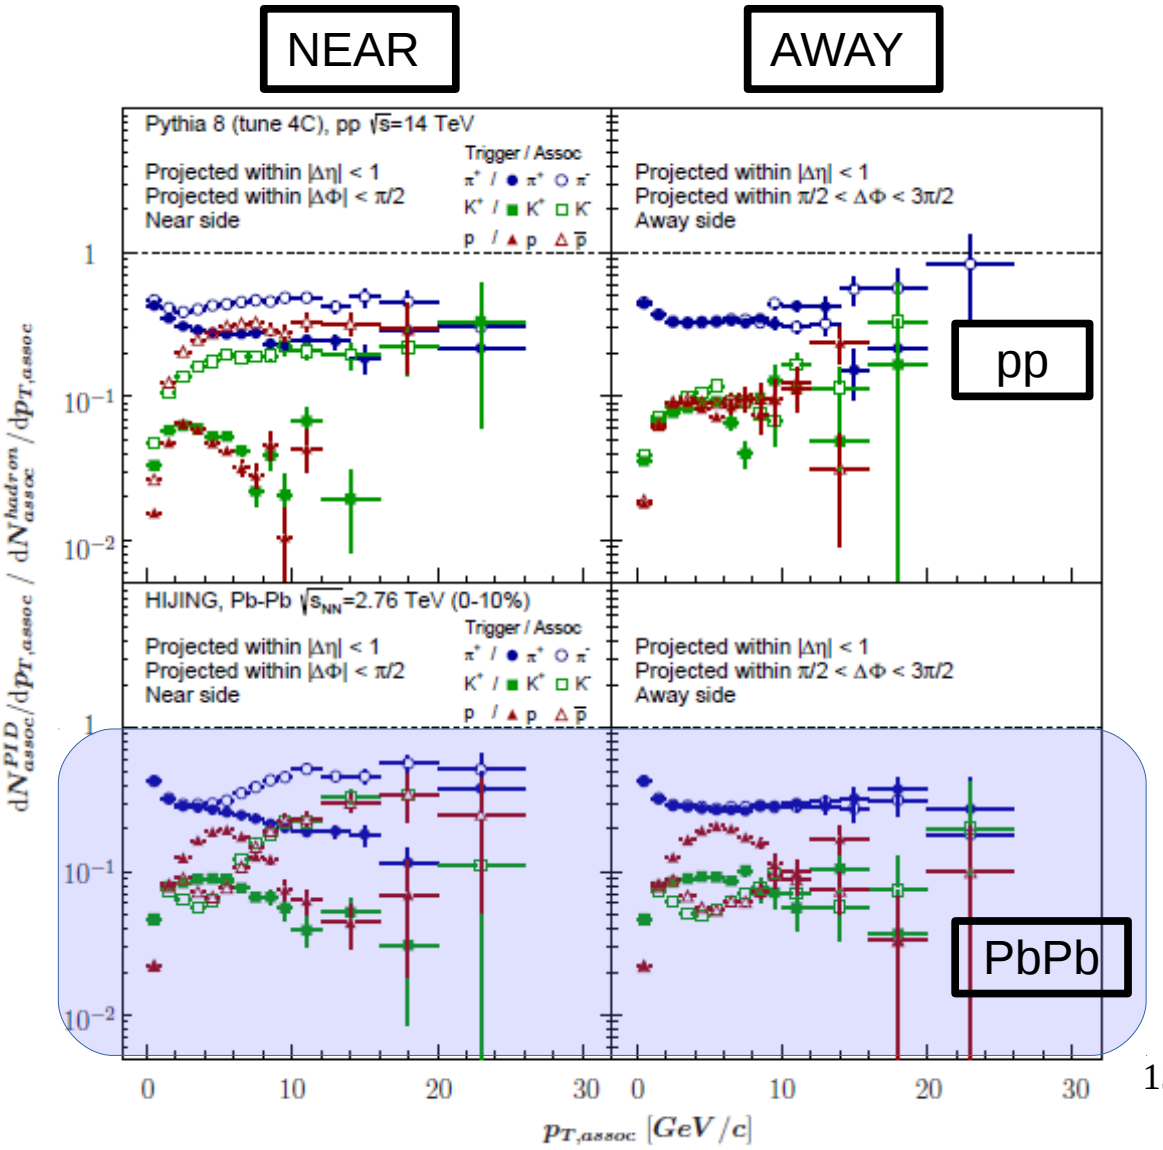
- To extract and enhance the expected quantum number conservation effects, the **ratio** of the PID-triggered-to-charged **hadron-triggered associated spectra** have been plotted

$$\frac{\mathrm{d}N^{PID}_{assoc}}{\mathrm{d}p_{T,assoc}} \Big/ \frac{\mathrm{d}N^{hadron}_{assoc}}{\mathrm{d}p_{T,assoc}}$$

- The splitting effect can be observed for any of the trigger species both in p-p and Pb-Pb collisions. The **splitting is larger on the near-side** than on the away-side.

- Qualitatively the strength of the quantum numbers:
  charge (Q) < strangeness (S) < baryon number (B)

- The **largest splitting** effect can be seen for unlike-sign correlations of **protons and antiprotons**.

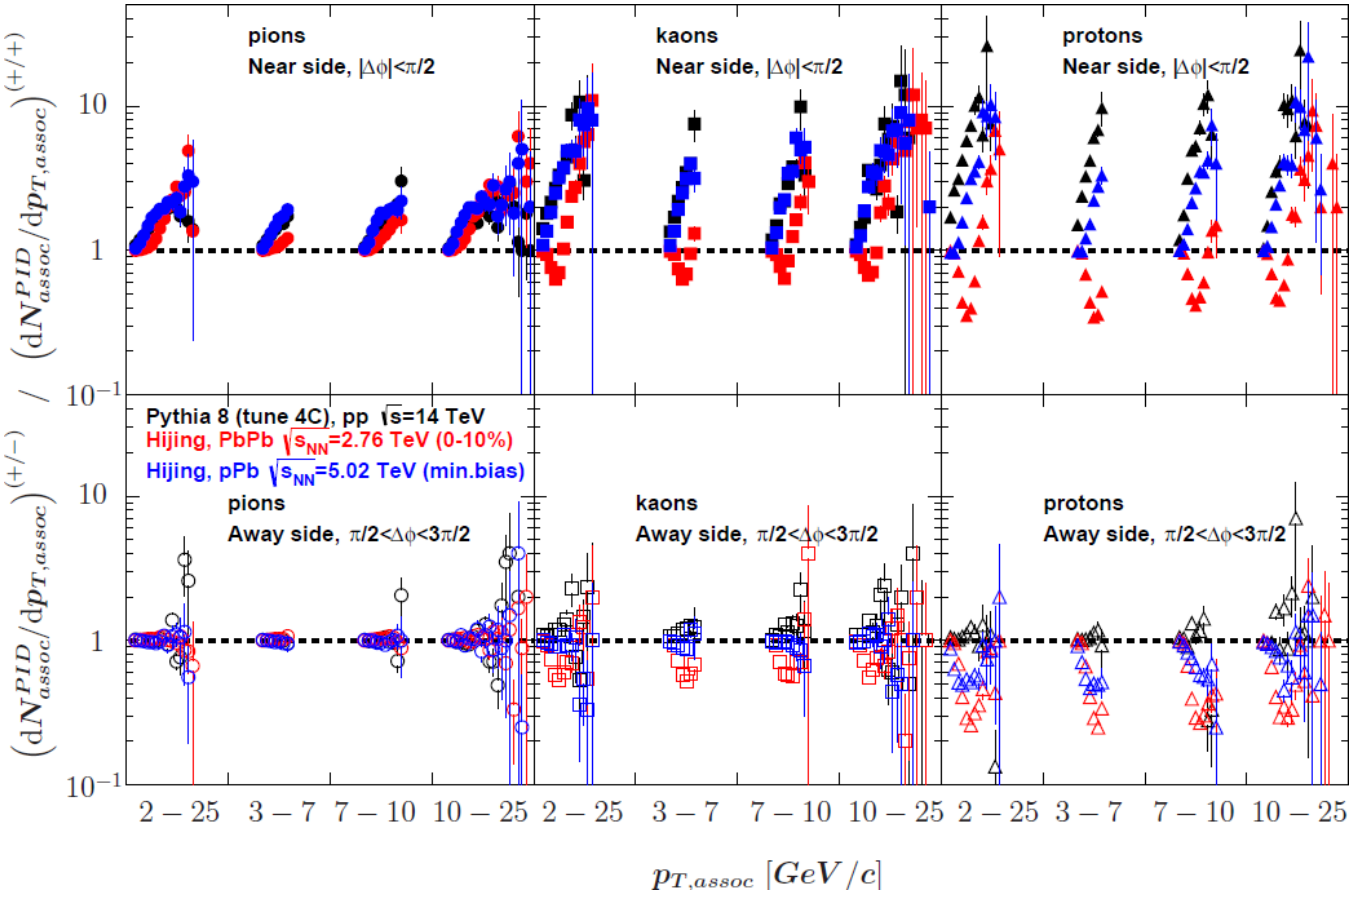


2. Quantum number conservation in correlations

Identified particle yields from like-sign and unlike-sign correlations in pp, pPb, and PbPb collisions

By plotting the differences between the **(+/-) unlike-sign and (+/+) like-sign** trigger/associated particles pairs for the PID-triggered-to/charged hadron triggered yields

$$\left(\frac{\mathrm{d}N^{PID}_{assoc}}{\mathrm{d}p_{T,assoc}} \Big/ \frac{\mathrm{d}N^{hadron}_{assoc}}{\mathrm{d}p_{T,assoc}}\right)^{(+/-)} \Big/ \left(\frac{\mathrm{d}N^{PID}_{assoc}}{\mathrm{d}p_{T,assoc}} \Big/ \frac{\mathrm{d}N^{hadron}_{assoc}}{\mathrm{d}p_{T,assoc}}\right)^{(+/+)} = \left(\frac{\mathrm{d}N^{PID}_{assoc}}{\mathrm{d}p_{T,assoc}}\right)^{(+/-)} \Big/ \left(\frac{\mathrm{d}N^{PID}_{assoc}}{\mathrm{d}p_{T,assoc}}\right)^{(+/+)}$$



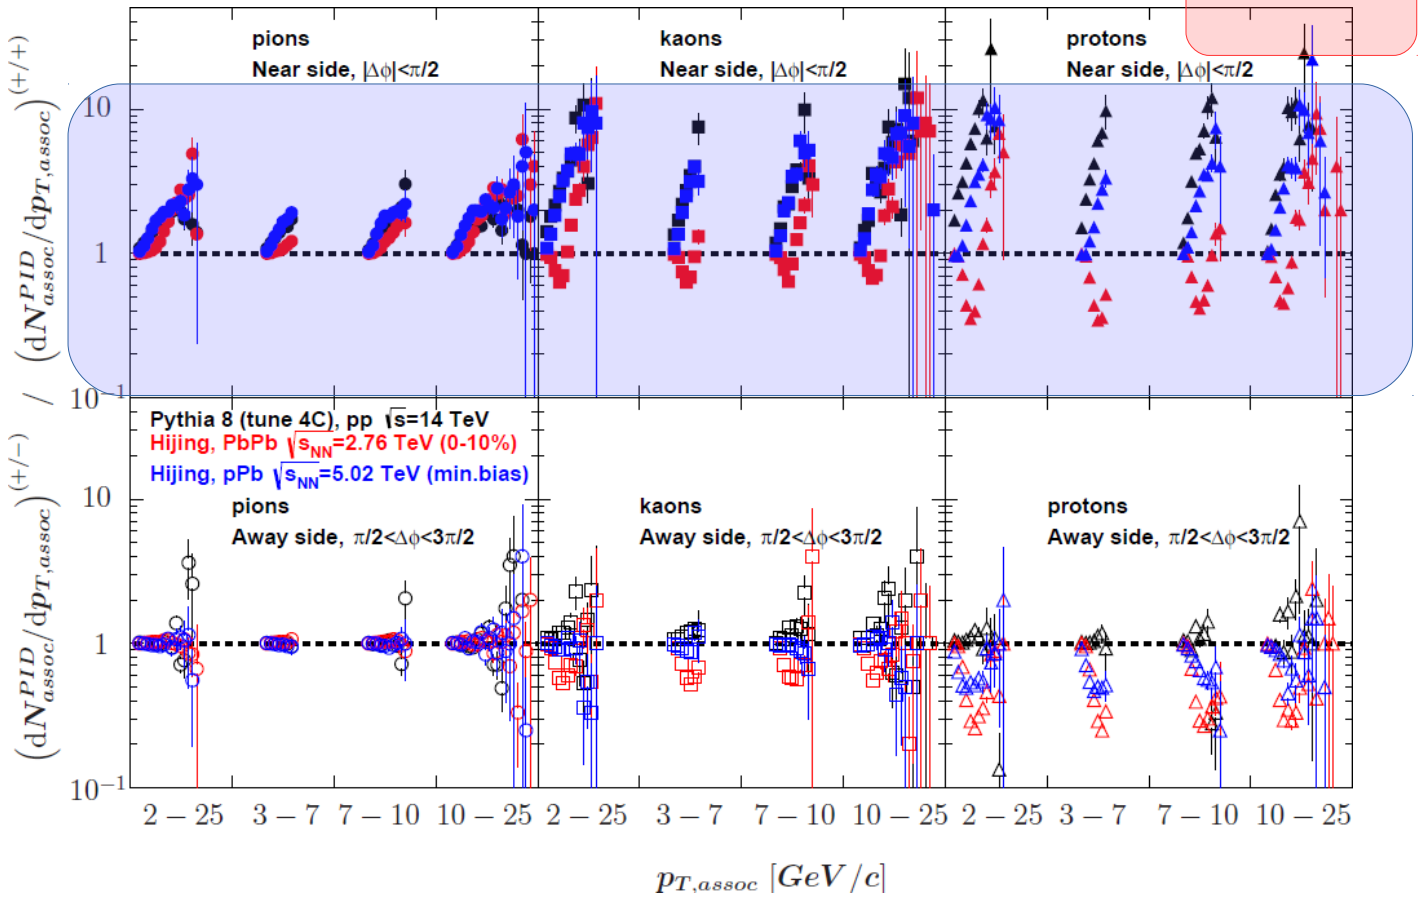
2. Quantum number conservation in correlations

Identified particle yields from like-sign and unlike-sign correlations in pp, pPb, and PbPb collisions

By plotting the differences between the **(+/-) unlike-sign and (+/+) like-sign** trigger/associated particles pairs for the PID-triggered-to/charged hadron triggered yields

$$\left(\frac{\mathrm{d}N^{PID}_{assoc}}{\mathrm{d}p_{T,assoc}} \Big/ \frac{\mathrm{d}N^{hadron}_{assoc}}{\mathrm{d}p_{T,assoc}}\right)^{(+/-)} \Big/ \left(\frac{\mathrm{d}N^{PID}_{assoc}}{\mathrm{d}p_{T,assoc}} \Big/ \frac{\mathrm{d}N^{hadron}_{assoc}}{\mathrm{d}p_{T,assoc}}\right)^{(+/+)} = \left(\frac{\mathrm{d}N^{PID}_{assoc}}{\mathrm{d}p_{T,assoc}}\right)^{(+/-)} \Big/ \left(\frac{\mathrm{d}N^{PID}_{assoc}}{\mathrm{d}p_{T,assoc}}\right)^{(+/+)}$$

NEAR



2. Quantum number conservation in correlations

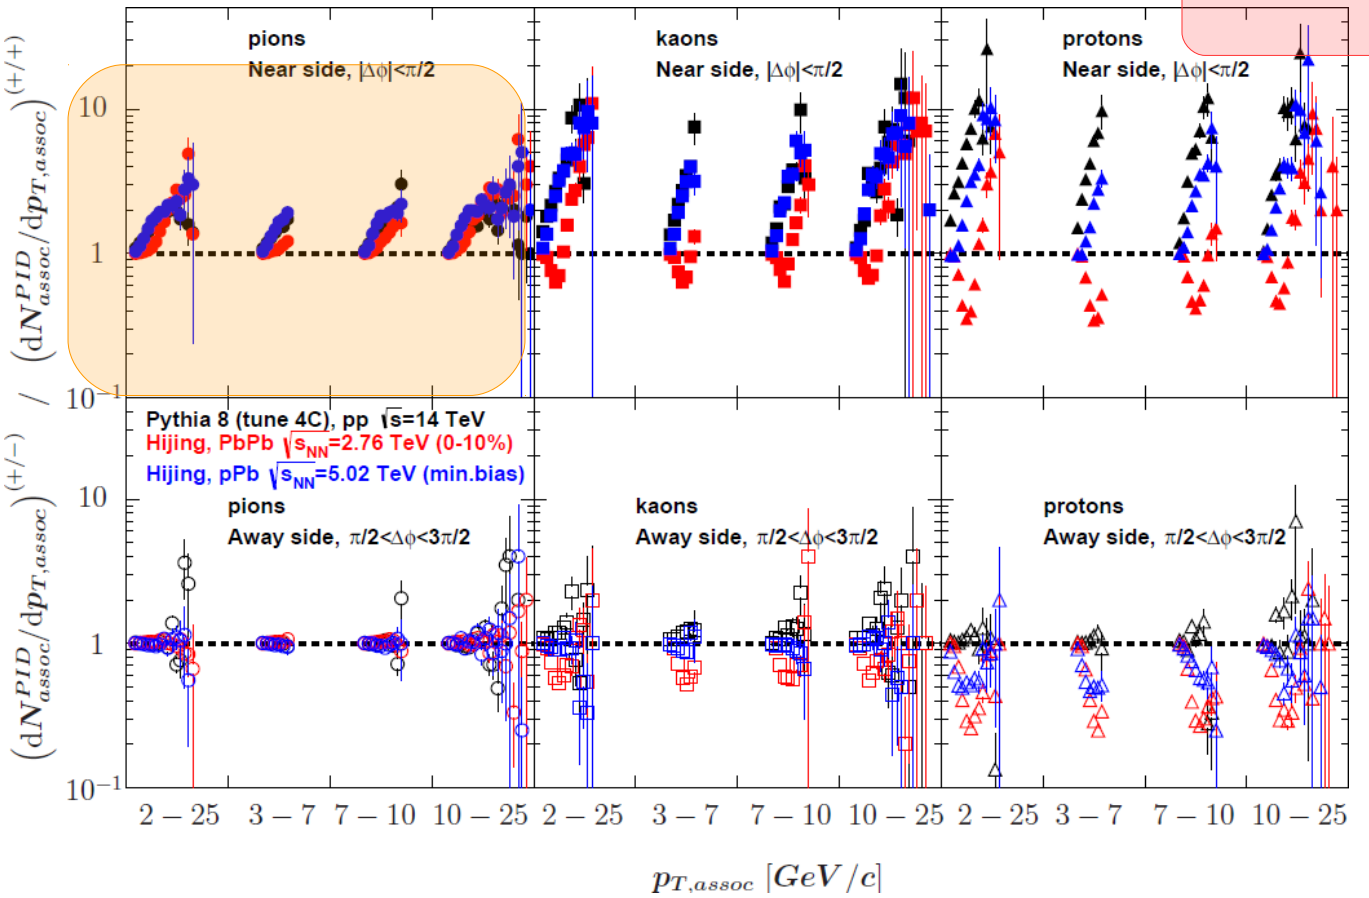
Identified particle yields from like-sign and unlike-sign correlations in **pp**, pPb, and PbPb collisions

By plotting the differences between the **(+/-) unlike-sign and (+/+) like-sign** trigger/associated particles pairs for the PID-triggered-to/charged hadron triggered yields

$$\left(\frac{dN^{PID}_{assoc}}{dp_{T,assoc}} \Big/ \frac{dN^{hadron}_{assoc}}{dp_{T,assoc}}\right)^{(+/-)} \Big/ \left(\frac{dN^{PID}_{assoc}}{dp_{T,assoc}} \Big/ \frac{dN^{hadron}_{assoc}}{dp_{T,assoc}}\right)^{(+/+)} = \left(\frac{dN^{PID}_{assoc}}{dp_{T,assoc}}\right)^{(+/-)} \Big/ \left(\frac{dN^{PID}_{assoc}}{dp_{T,assoc}}\right)^{(+/+)}$$

NEAR

PION: The PID-triggered associated spectra for the like-sign and unlike-sign trigger/associated particle pairs is **similar for pions** in p-p, p-Pb and Pb-Pb collisions



2. Quantum number conservation in correlations

Identified particle yields from like-sign and unlike-sign correlations in pp, pPb, and PbPb collisions

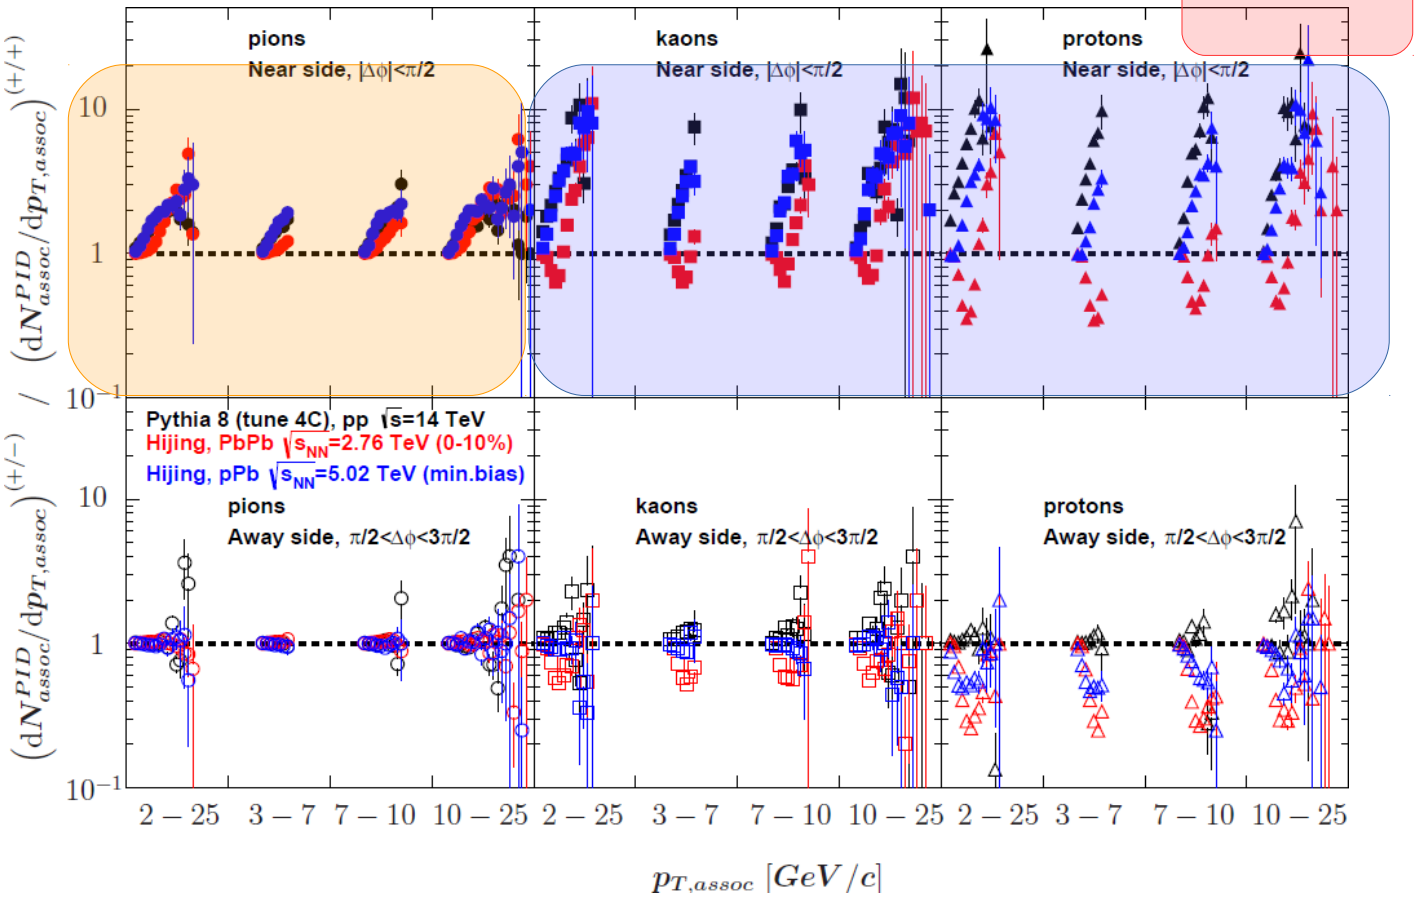
By plotting the differences between the **(+/-) unlike-sign and (+/+) like-sign** trigger/associated particles pairs for the PID-triggered-to/charged hadron triggered yields

$$\left(\frac{dN^{PID}_{assoc}}{dp_{T,assoc}} \Big/ \frac{dN^{hadron}_{assoc}}{dp_{T,assoc}}\right)^{(+/-)} \Big/ \left(\frac{dN^{PID}_{assoc}}{dp_{T,assoc}} \Big/ \frac{dN^{hadron}_{assoc}}{dp_{T,assoc}}\right)^{(+/+)} = \left(\frac{dN^{PID}_{assoc}}{dp_{T,assoc}}\right)^{(+/-)} \Big/ \left(\frac{dN^{PID}_{assoc}}{dp_{T,assoc}}\right)^{(+/+)}$$

NEAR

The PID-triggered associated spectra for the like-sign and unlike-sign trigger/associated particle pairs is **similar for pions** in p-p, p-Pb and Pb-Pb collisions

KAON / PROTON
In contrast, there is **clear difference between the p-p, p-Pb and Pb-Pb systems for kaons and protons** at the near side.



2. Quantum number conservation in correlations

Identified particle yields from like-sign and unlike-sign correlations in pp, pPb, and PbPb collisions

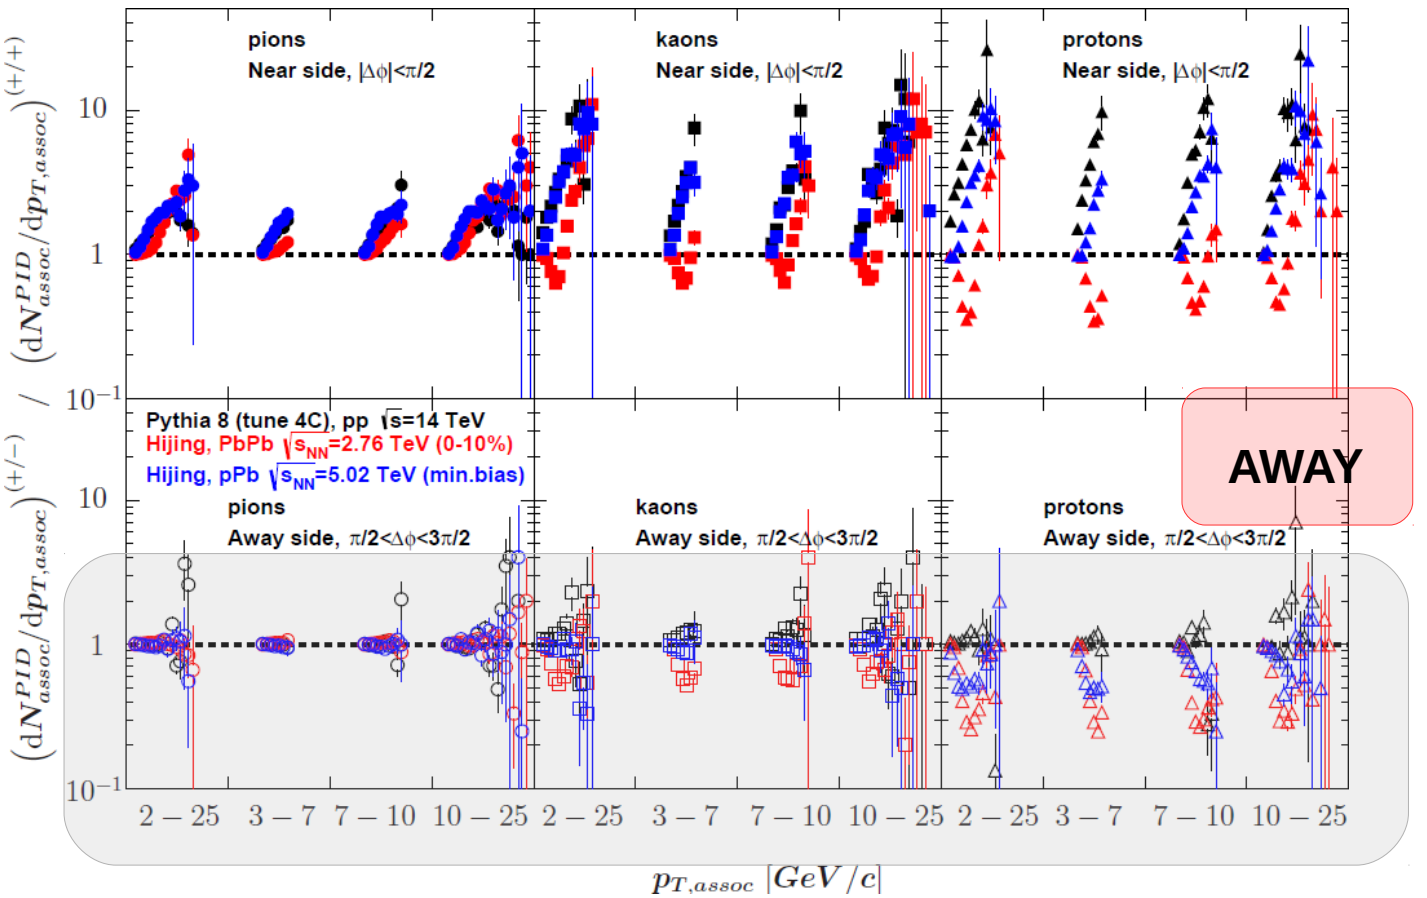
By plotting the differences between the **(+/-) unlike-sign and (+/+) like-sign** trigger/associated particles pairs for the PID-triggered-to/charged hadron triggered yields

$$\left(\frac{\mathrm{d}N^{PID}_{assoc}}{\mathrm{d}p_{T,assoc}} \Big/ \frac{\mathrm{d}N^{hadron}_{assoc}}{\mathrm{d}p_{T,assoc}}\right)^{(+/-)} \Big/ \left(\frac{\mathrm{d}N^{PID}_{assoc}}{\mathrm{d}p_{T,assoc}} \Big/ \frac{\mathrm{d}N^{hadron}_{assoc}}{\mathrm{d}p_{T,assoc}}\right)^{(+/+)} = \left(\frac{\mathrm{d}N^{PID}_{assoc}}{\mathrm{d}p_{T,assoc}}\right)^{(+/-)} \Big/ \left(\frac{\mathrm{d}N^{PID}_{assoc}}{\mathrm{d}p_{T,assoc}}\right)^{(+/+)}$$

The PID-triggered associated spectra for the like-sign and unlike-sign trigger/associated particle pairs is **similar for pions** in p-p, p-Pb and Pb-Pb collisions.

In contrast, there is clear **difference** between the p-p, p-Pb and Pb-Pb systems for **kaons and protons** at the near side.

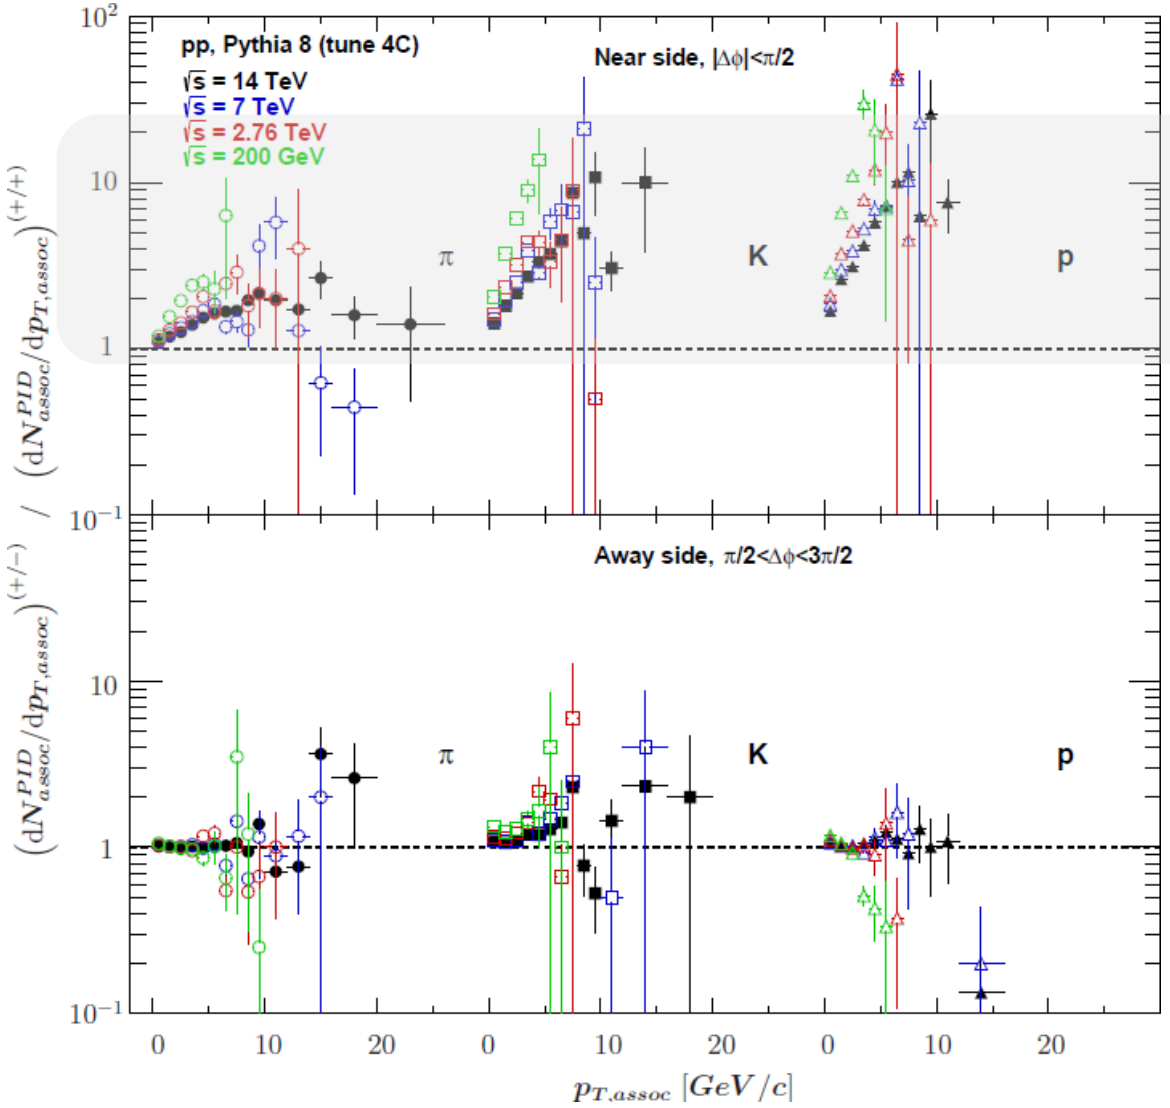
Less deviance on the away side.



2. Quantum number conservation in correlations

Yield dependence on collision energy in p-p

Near side:
the splitting decreases with increasing $\sqrt{s}$

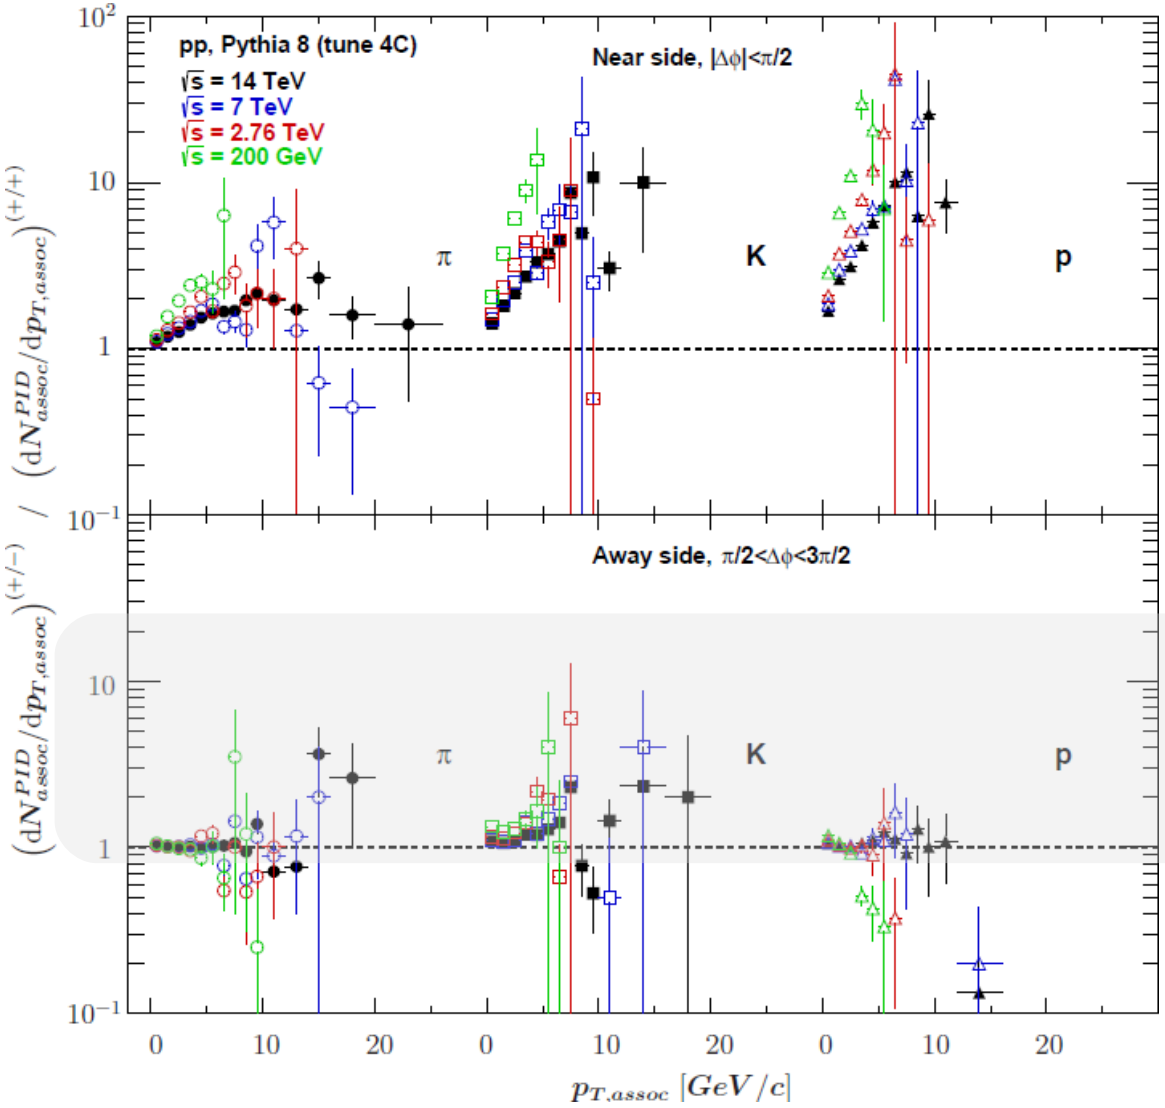


2. Quantum number conservation in correlations

Yield dependence on collision energy in p-p

Near side:
the splitting decreases with increasing $\sqrt{s}$

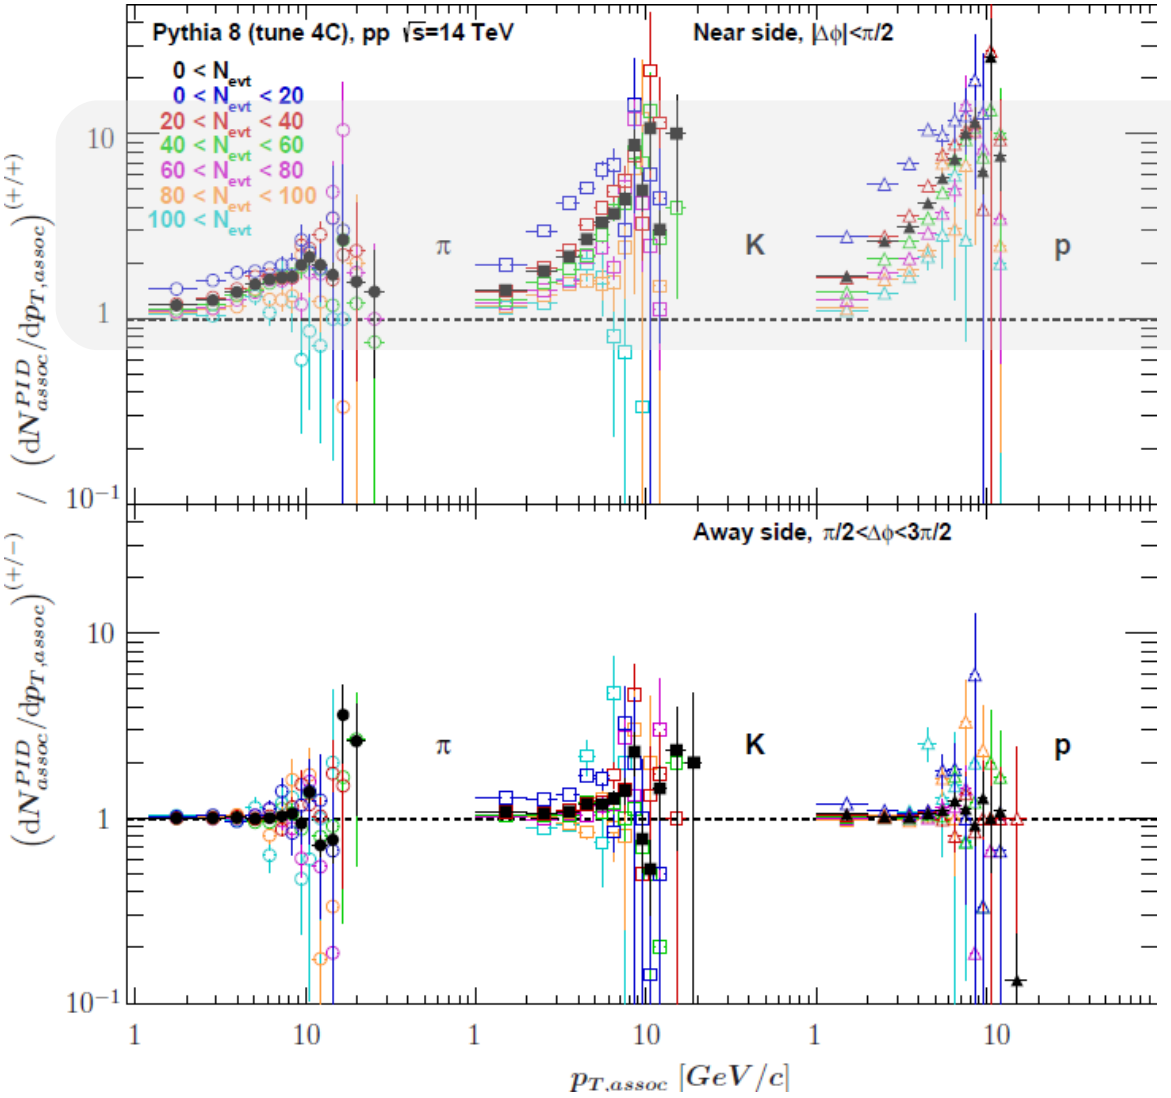
Away side:
no obvious energy dependence, kaons show small asymmetry for all $\sqrt{s}$



2. Quantum number conservation in correlations

Yield dependence on event multiplicity in p-p

Near side:
the higher the event multiplicity the smaller the size of the splitting due to increasing underlying event contribution at higher multiplicities

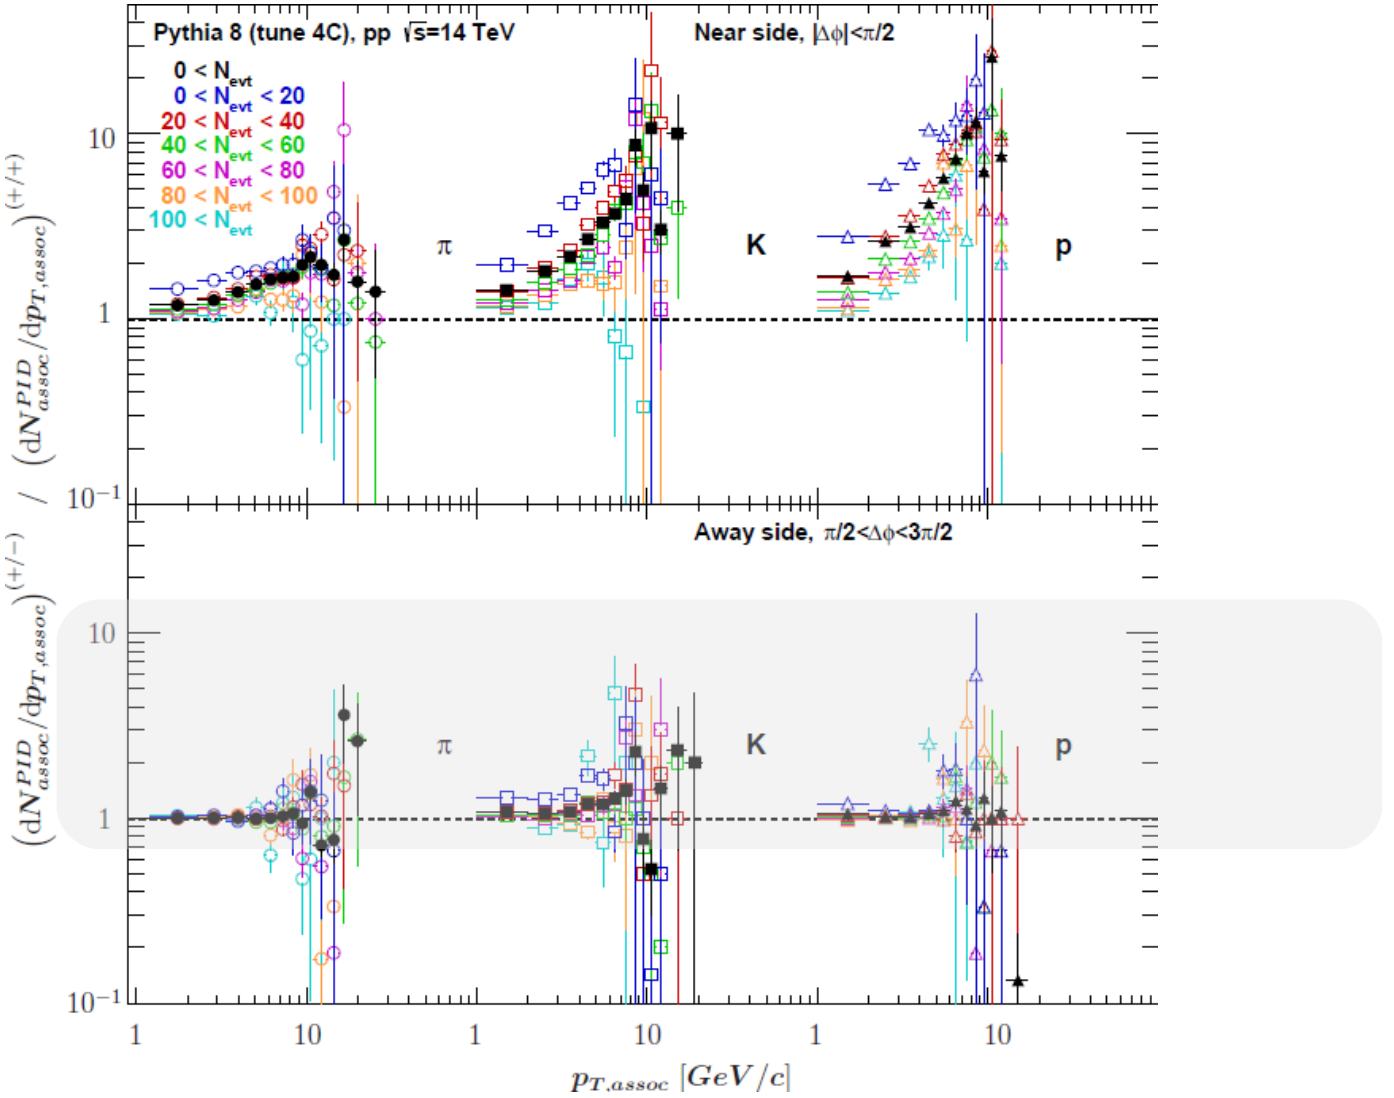


2. Quantum number conservation in correlations

Yield dependence on event multiplicity in p-p

Near side:
the higher the event multiplicity the smaller the size of the splitting due to increasing underlying event contribution at higher multiplicities

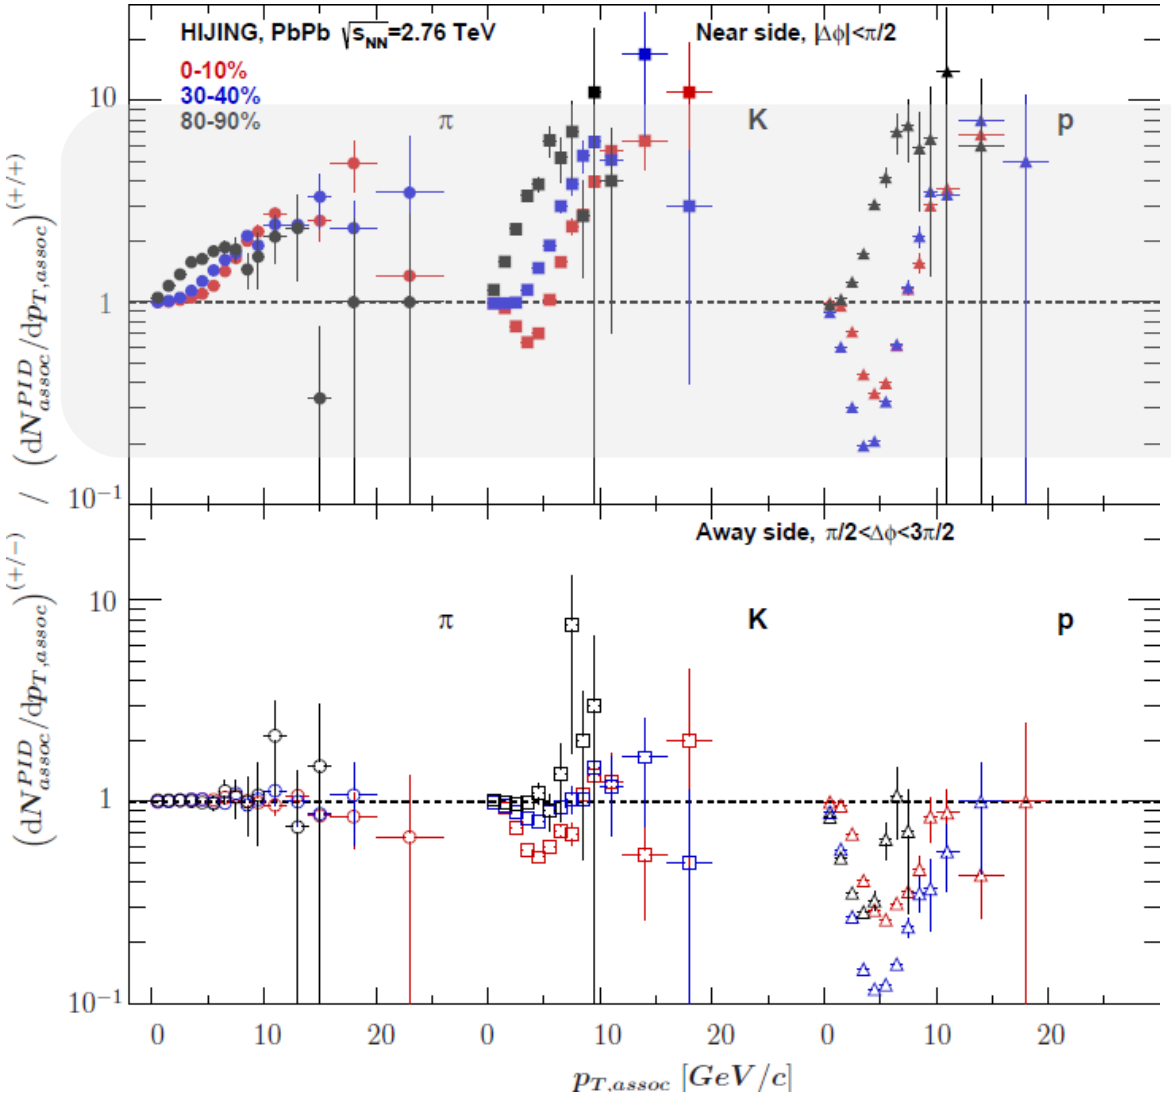
Away side:
no obvious dependence with event multiplicity



2. Quantum number conservation in correlations

Yield dependence on centrality in Pb-Pb

Near side:
reverse evolution pattern is observed for kaons and protons as a function of centrality

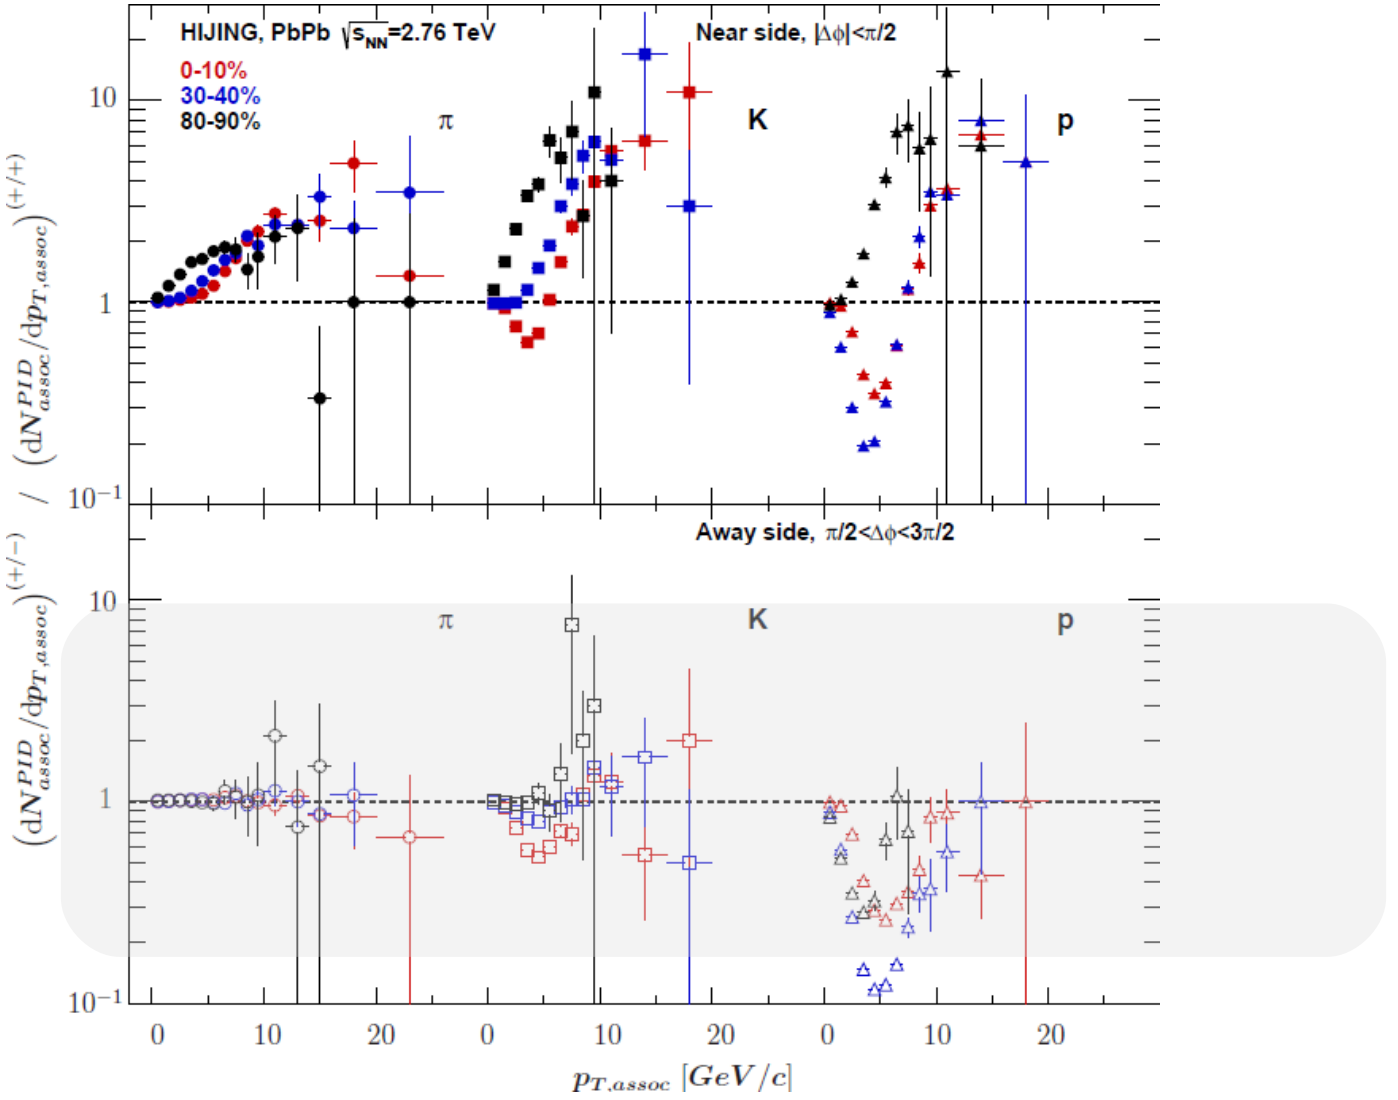


2. Quantum number conservation in correlations

Yield dependence on centrality in Pb-Pb

Near side:
reverse evolution pattern is observed for kaons and protons as a function of centrality

Away side:
kaons and protons show similar reversal trend as on the near side



2. Quantum number conservation in correlations

Δφ projections

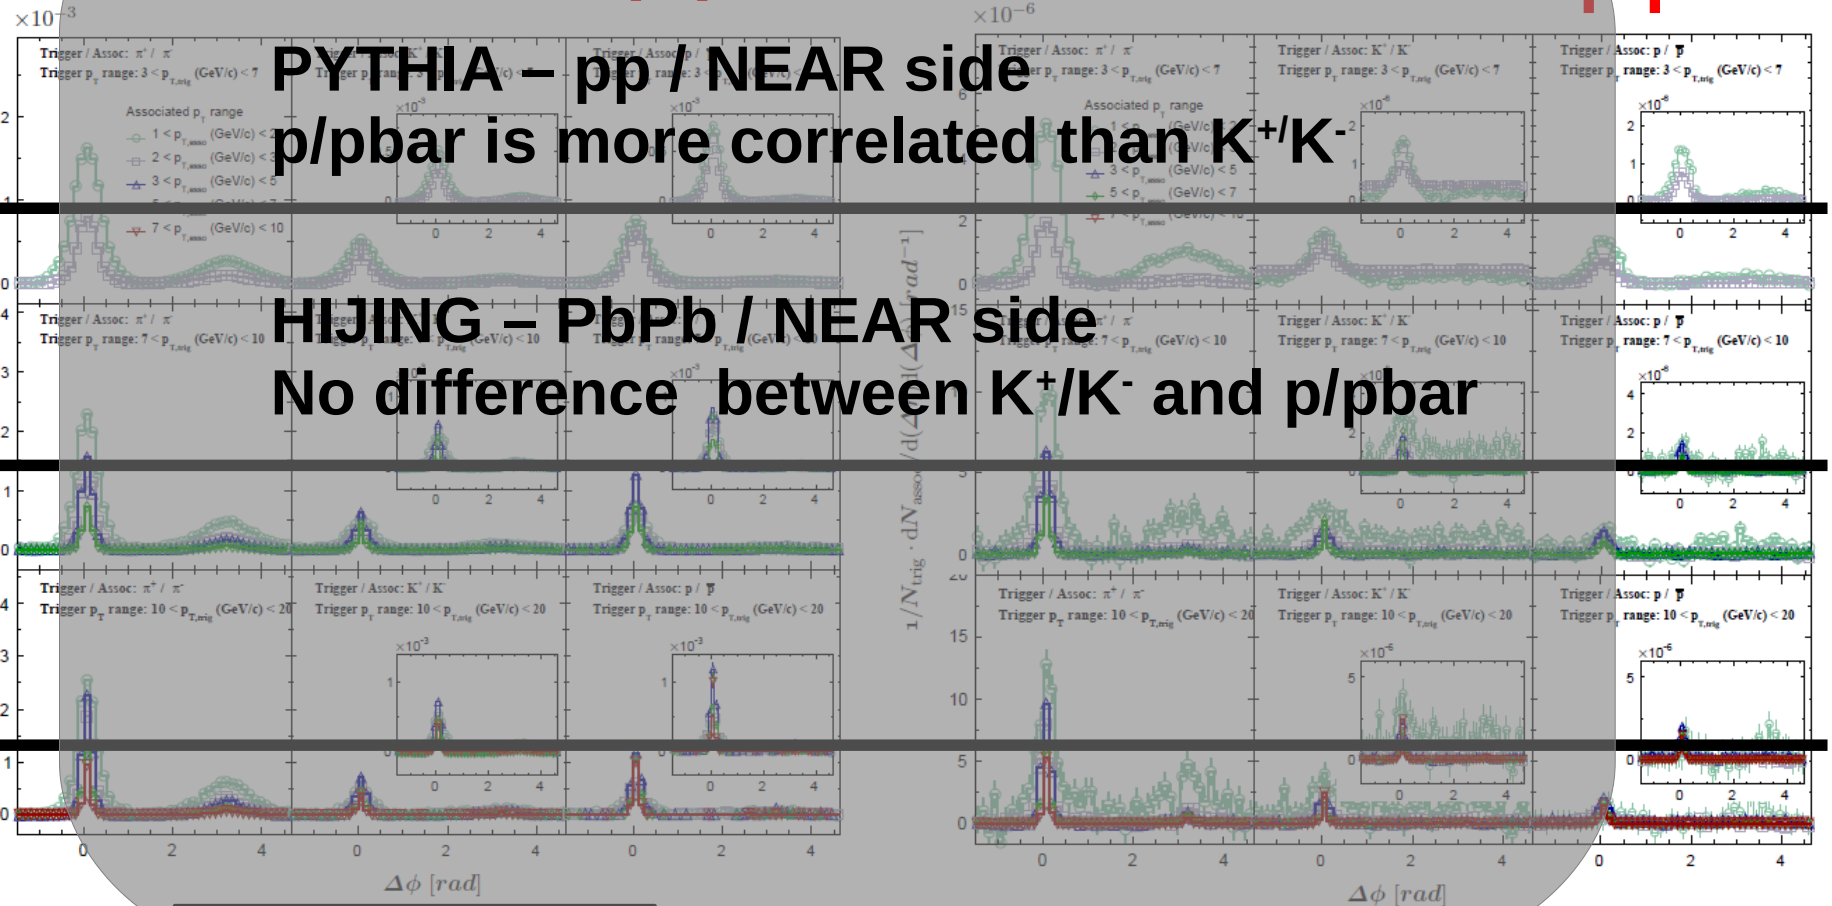
π^+/π^- K^+/K^- p/pbar π^+/π^- K^+/K^- p/pbar



PYTHIA – pp / NEAR side
p/pbar is more correlated than K^+/K^-

HIJING – PbPb / NEAR side
No difference between K^+/K^- and p/pbar

p-p 7TeV, PYTHIA 6 (Perugia0)

Pb-Pb 2.76TeV, HIJING

3. Summary and Outlook

MC simulations and analysis have been performed to study PID-PID azimuthal correlations at mid-rapidity

The observed splitting effect of the PID-triggered-to-charged hadron-triggered associated spectra shows

- **a peculiar pattern which**
- The the most prominent for p-p unlike-sign associated particle pairs (compared to K+/K-, +- pairs) on the near- and away side;
- has a reverse behaviour in Pb-Pb and in p-Pb on the away-side and remains unchanged on the near-side in Pb-Pb;
- has similar behaviour in the p-p, peripheral Pb-Pb and minimum bias p-Pb on the near-side in terms of the conservation of baryon numbers;
- decreases towards higher event multiplicities in p-p;
- decreases with increasing collision energies from RHIC to LHC in p-p.

- **No experimental measurements to contrast with the observed MC analysis**
  - Further Monte Carlo checks needed to have a better understanding...
- Analysis has been started to perform the same analysis exploiting the PID capabilities of ALICE at the LHC
- The observed interesting patterns can be measured at higher momentum in ALICE
  - In principle this can be done by the TPC, statistical method: relativistic dE/dx
  - Purity PID cuts
