Review of the commissioning of Sector 45

Thursday, 28 February 2008 - Thursday, 28 February 2008

CERN

Book of Abstracts

Contents

0

Identification of main issues appearing during the commissioning Sector 45

Author: Roberto Saban[1]

[1] *CERN*

- Event driven by view from operation - invitation to an open discussion
- Scenarios: commissioning to 450 GeV, 2 TeV and 4 .. 6 TeV
- Key dates in preparation for the next sector and outlook to planning
- Discussions on improvements: what can be done in the next 3-4 weeks?
- 2 shifts during 5 days versus 3 shifts during 7 days, , MPP analysis, what can be done in a nightshift –WE? Bottlenecks in manpower
- Organisation: HC coordinator on a weekly basis? For coordination between sectors etc.
- (written) guidelines for operators (coordination tools, conditions for powering)
- Commissioning meetings efficient? How continue activities during meetings?
- Follow-up by mini teams on: Automatic commissioning and controls issues, Tools required to optimize commissioning, Organisation, System upgrades and improvements

1

Powering Test Overview

Author: Boris Bellesia[1]

[1] *Politecnico di Torino*

- What happens before powering tests after cooldown
- Main issues that slowed us down
- ELQA: Continue as for sector 45? Further optimisation of the strategy?
- What has been done during the powering tests? During what time? By whom? Efficiency?
- How to ensure minimization of re-commissioning 45 and to secure what has been achieved?
- How to avoid that changes during the “shutdown”require re-commissioning?

2

Safety and access I

Author: Anne Funken[1]

[1] *CERN*

- Electrical safety during interventions, “consignation”
- Electrical safety subsectors

3

Safety and access II

Author: Magali Gruwe[1]

[1] *CERN*

- Hardware commissioning using the access system
- Set the rules for access, different modes

4

Safety and access III

Authors: Hugues Thiesen[None]; Karl Hubert Mess[1]

[1] *CERN AT-MEL*

Corresponding Author: hugues.thiesen@cern.ch

- Tunnel access during powering –what can access during powering as a function of current in the different circuits? Clear and transparent rules.

5

Cryo Performance & Operation

Author: Serge CLAUDET[1]

[1] *CERN AT ACR*

- Availability for cryogenic system
- Recovery time after quenches: what can we expect?
- Operation overnight and over the weekend: is it possible?
- Operation with several sectors in parallel, what will change?
- Presence in the CCC
- Level measurements
- How to ensure a correct Helium level for operation?

6

Cryogenic conditions for powering tests

Author: Andrzej SIEMKO[1]

[1] *CERN AT-MTM*

- What can be done at what temperature? (e.g. below 2.8 K low current tests), and when can we start the tests?
- Relaxed operation at reduced current (e.g. can we operate without cold compressors a magnet currents corresponding to 2 TeV)?
- Table for all steps and all circuits?
- Orbit correctors 60 / 120 A –what conditions? What needs to be watched by operators?
- Procedure: masking of interlocks to provide CryoStart and CryoMaintain

7

Power Converters

Authors: David Nisbet[1]; Yves Thurel[1]

[1] *CERN*

- 600 A spikes during 0 V crossing and QPS system
- Spikes and how to avoid them (IERROR and IEARTH)
- RB power converter performance, is there an issue?

8

Quench Protection and Energy Extraction System

Authors: Knud Dahlerup-Petersen[1]; Reiner Denz[2]

[1] *CERN*

[2] *CERN AT-MEL-PM*

- Partial heater firing if switches do not open –yes/no?
- Access to the tunnel for 600 A extraction switches, can be optimised?
- Firing heaters without current in the magnet circuit –Why? EMC due to other tests?
- Closing switches for many circuits

9

Time for commissioning versus objectives

Author: Antonio Vergara Fernandez[1]

[1] *Cent.de Investigac.Energeticas Medioambientales y Tecnol. (CIEMA*

- 450 GeV, 2 TeV and 5 .. 6 TeV: what circuits at what current? What can be left for later? (remember: it is always possible to bring in other circuits on the fly)
- How much time is required to commission for injection, for ˜2 TeV, 4-6 TeV and 7 TeV? What could be gained? What circuits could be left out?
- When is tunnel access required? By whom? How to optimise it? What can be done without access to the tunnel?

10

Procedures

Authors: Nuria Catalan Lasheras[1]; Walter Venturini Delsolaro[1]

[1] *CERN*

- Procedures and their realisation in sequences: can they be lighter?
- EDMS approval of procedures and their changes
- Analysis and approval of test steps in CCC –can it be improved?

11

What quenches did we observe? What is expected?

Authors: Arjan Verweij[1]; Robert Henry Flora[2]

[1] *CERN*

[2] *Fermi National Accelerator Lab. (Fermilab)*

- What circuits?
- What quenches?
- Why did it quench?

12

Tools provided by CO

Author: Markus Zerlauth[1]

[1] *CERN*

- Status of PM system? Data gets sometimes stuck?
- PM event builder
- Can we become more efficient with more automatic analysis?
- Coherence MTF –LSA etc.
- Long tests: can one reduce the time of the test online, for example due to a long plateau? PASS TO THE NEXT STEP button.
- Managing powering: better SOC names to avoid confusion? SOCs per day?
- Tools for powering groups of circuits ((based on SOCs?)

13

Tools for coordination

Author: Alvaro Marqueta Barbero[1]

[1] *Cent. Invest. Energ. Medioamb. Tec. (CIEMAT) - Consejo Sup. de I*

- How to improve the Powering Test Visualisation tool, etc.
- How to improve the planning tool (EXCEL?) Can both be merged?

14

Feed Back

Authors: Alick Macpherson[None]; LHC HWC Operators [None]

Corresponding Authors: lhc-hwc-operators@cern.ch, alick.macpherson@cern.ch

15

Summary and Discussions

Author: Rüdiger Schmidt[1]

[1] *CERN*
