Motivation and roadmap

- \tilde{q}_L, \tilde{q}_R mixing large for 3rd generation squarks due to large top Yukawa coupling → **lighter masses** compared to 1st, 2nd gen. squarks
- Naturalness → **light top/bottom squarks, (higgsinos, gluino)**
- Study simplified “models”:
 - assume only sbottom / stop pair production
 - simplified decays; depend on Δm (stop, chargino / neutralino)
 - 100% branching fraction to the given decay

- Backgrounds:
 - $t\bar{t}$, Z+HF, W+HF
- Define CRs enhanced in a particular background:
 - $e\mu$ CRA: $t\bar{t}$
 - $ee/\mu\mu$ CRA: Z+HF
 - 1L CRA: $t\bar{t}$, W + HF

JHEP10(2013)189 : Direct Sbottom

Analysis also has sensitivity to $\tilde{t} \rightarrow b + \tilde{\chi}_1^\pm, \tilde{\chi}_1^\pm \rightarrow W^* + \tilde{\chi}_1^0$, very low $\Delta m(\tilde{\chi}_1^\pm, \tilde{\chi}_1^0)$.

Analyses targeting $\tilde{b} \rightarrow t + \tilde{\chi}_1^\pm$ and $\tilde{b} \rightarrow b + \tilde{\chi}_2^0$ in backup slides.

Build m_{T2} from the two leptons' p_T (and the missing E_T).

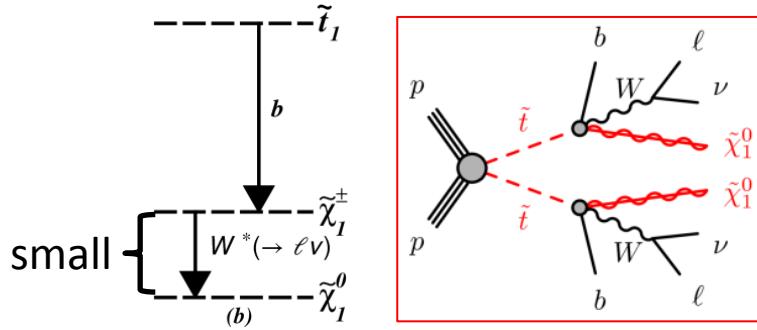

Dileptonic $t\bar{t}$, WW : m_{T2} kinematic endpoint at W mass.

5 May 2014

ATLAS-CONF-2013-037: 1L + 4(1 b -)jets + missing E_T

$t\tilde{t}$ dominant background

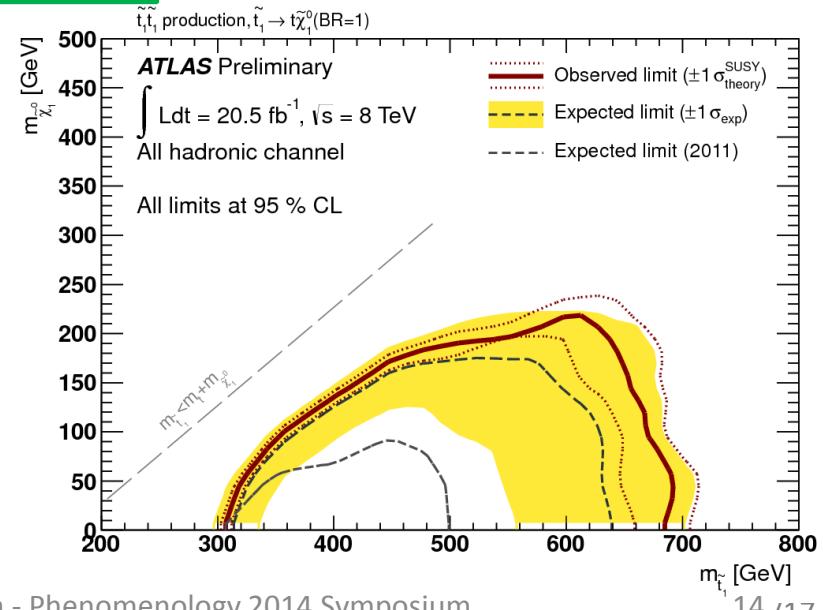

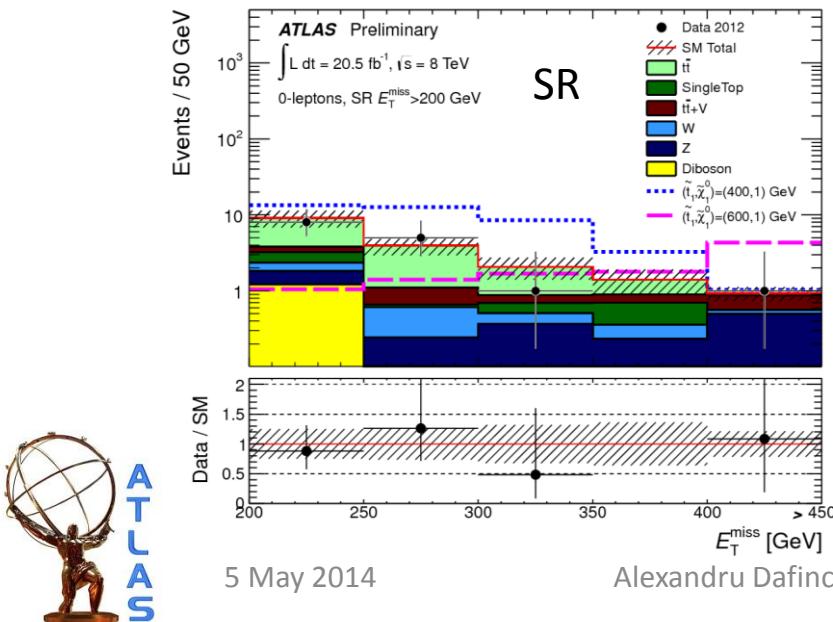

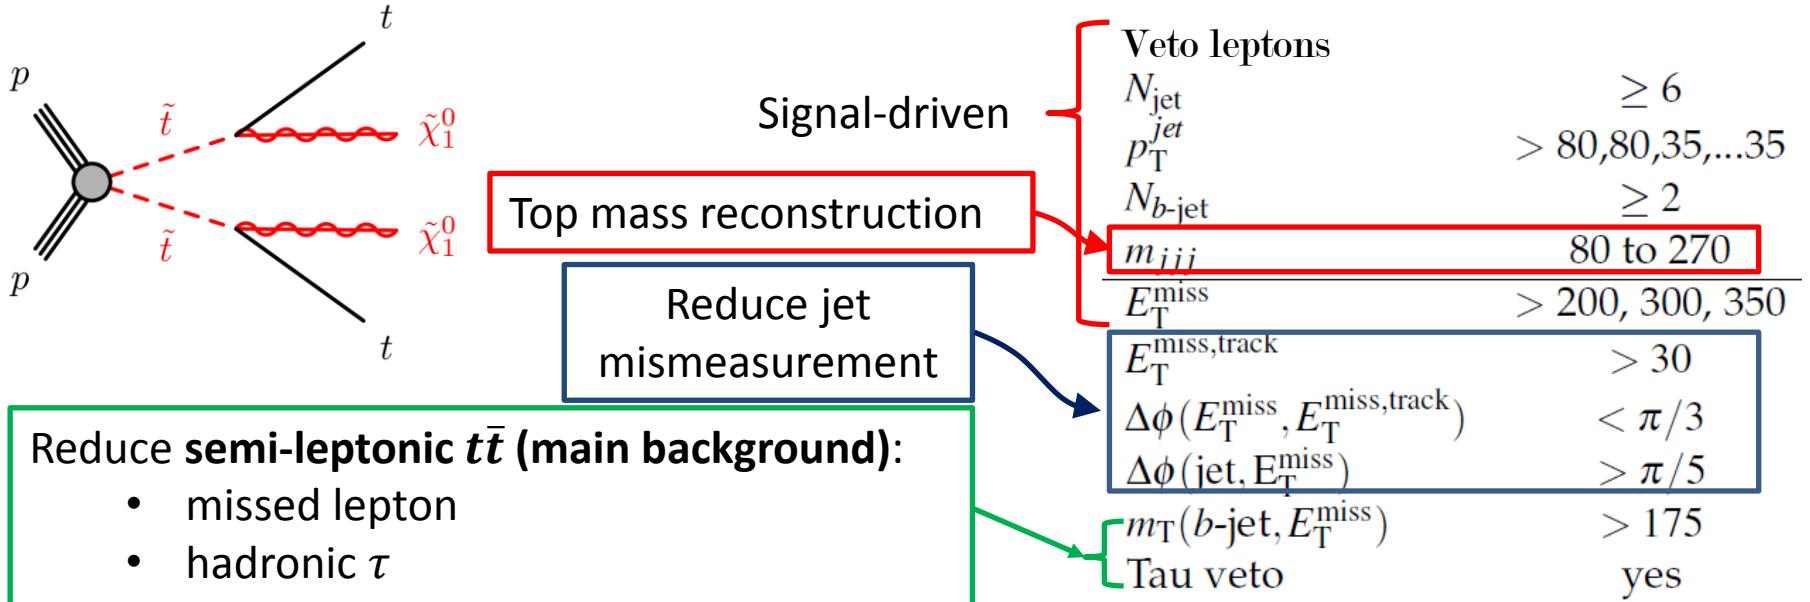

- SRs based on:
 - Missing E_T
 - (b -)jet multiplicity
 - m_T , m_{T2} – variables
 - m_{eff}
 - reconstructed top mass
- Acceptance sensitive to stop polarisation (mostly RH assumed in plots)

SRs/interpretation also exist for

$\tilde{t}_1\tilde{t}_1$ production, $\tilde{t}_1 \rightarrow b + \tilde{\chi}_1^\pm, \tilde{\chi}_1^\pm \rightarrow W^{(*)} + \tilde{\chi}_1^0$, $m_{\tilde{\chi}^\pm} = 150$ GeV

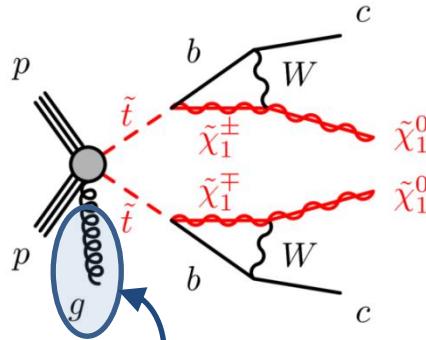

ATLAS-CONF-2013-024: 0L + 6 (2 b-)jets + missing E_T

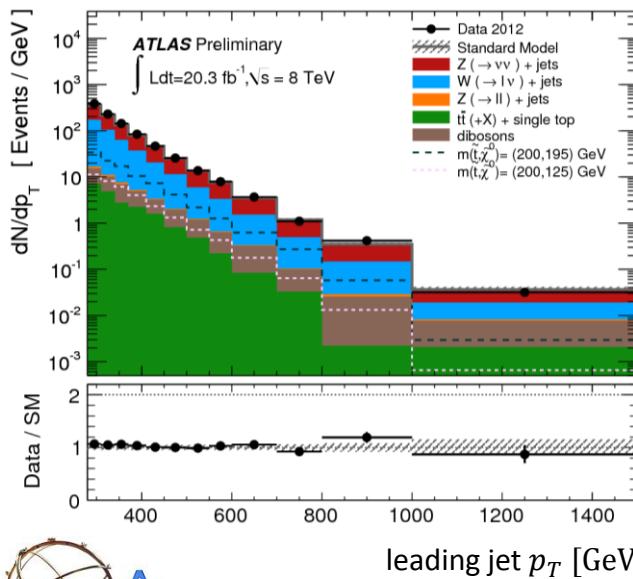

ATLAS-CONF-2013-068: 0L + mono-jet/c-jets + missing E_T

- If $m(\tilde{t}) < m(\tilde{\chi}_1^0) + m(b) + m(W)$, $\tilde{t} \rightarrow c + \tilde{\chi}_1^0$ can be dominant decay mode.
- First LHC search for this challenging scenario.

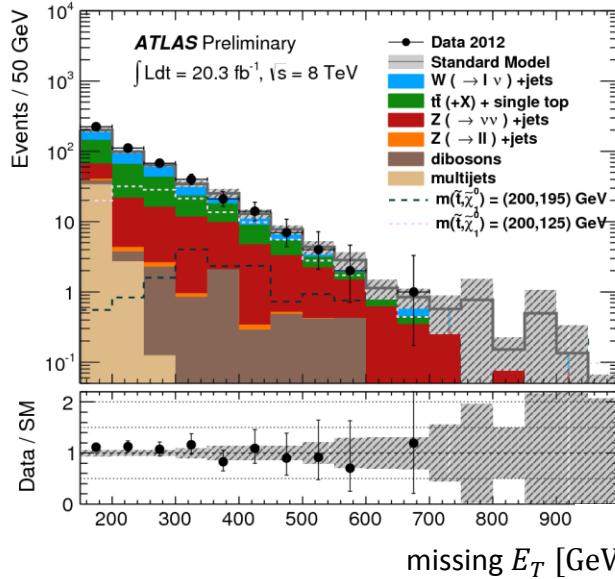

Lepton vetoes: no isolated electrons (muons) with $p_T > 20$ GeV ($p_T > 10$ GeV)	
Monojet-like selection M1	Charm-tagged selection C1
At most three jets with $p_T > 30$ GeV and $ \eta < 2.8$	At least three jets with $p_T > 30$ GeV and $ \eta < 2.5$ (in addition to the leading jet) b -veto for second and third jet medium c -tag for fourth jet
$\Delta\phi(\text{jet}, p_T^{\text{miss}}) > 0.4$	$\Delta\phi(\text{jet}, p_T^{\text{miss}}) > 0.4$
minimum leading jet p_T (GeV)	270
minimum E_T^{miss} (GeV)	410

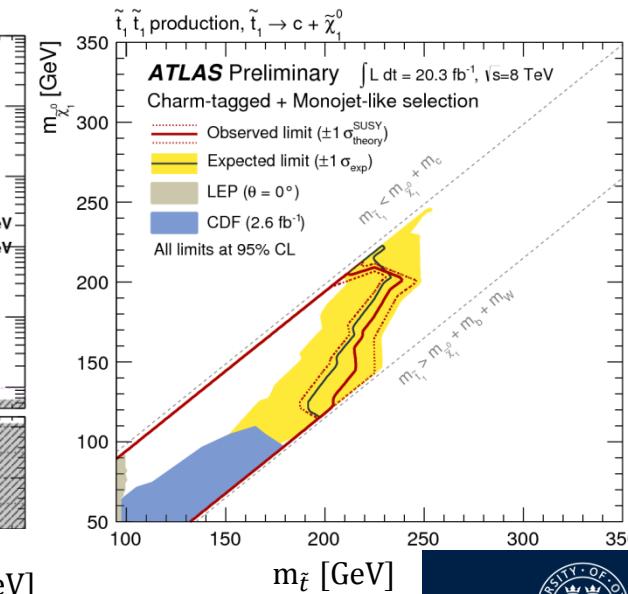

SRs rely on ISR jet to boost the \tilde{t} decay products.

Monojet selection

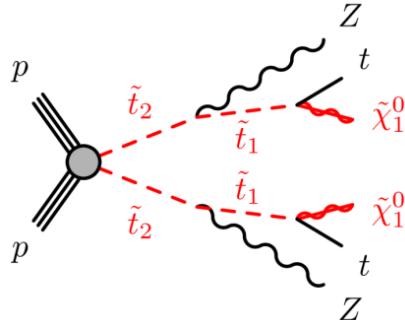

Charm-tagged selection

1403.5222: $Z + b\text{-jet} + \text{jets} + \text{missing } E_T$

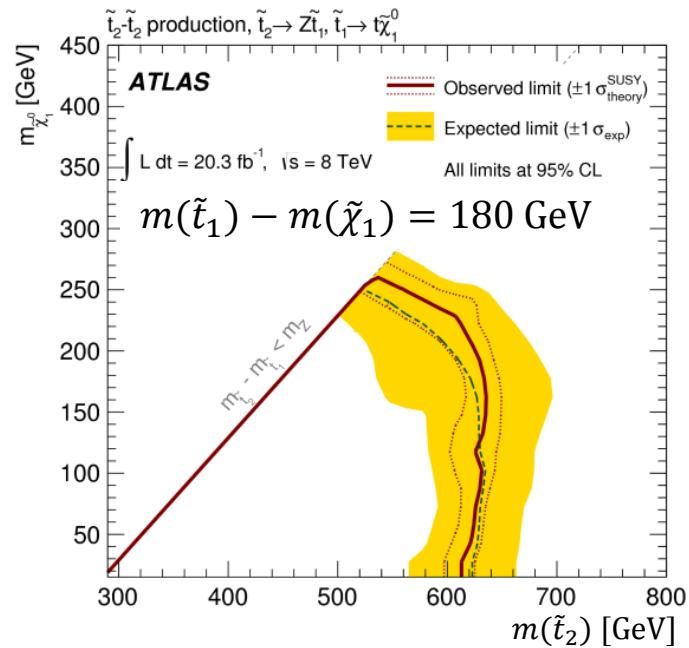

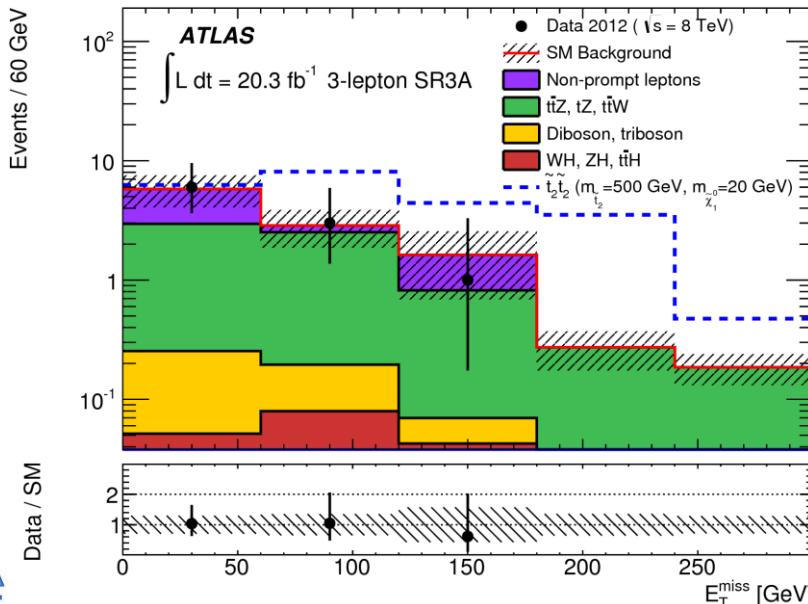

- If $m(\tilde{t}_1) \sim m(t) + m(\tilde{\chi}_1)$, difficult to distinguish $\tilde{t}\tilde{t}^*$ from $t\bar{t}$.
- Look instead for $\tilde{t}_2 \rightarrow \tilde{t}_1 + Z$.

Final state targeted:

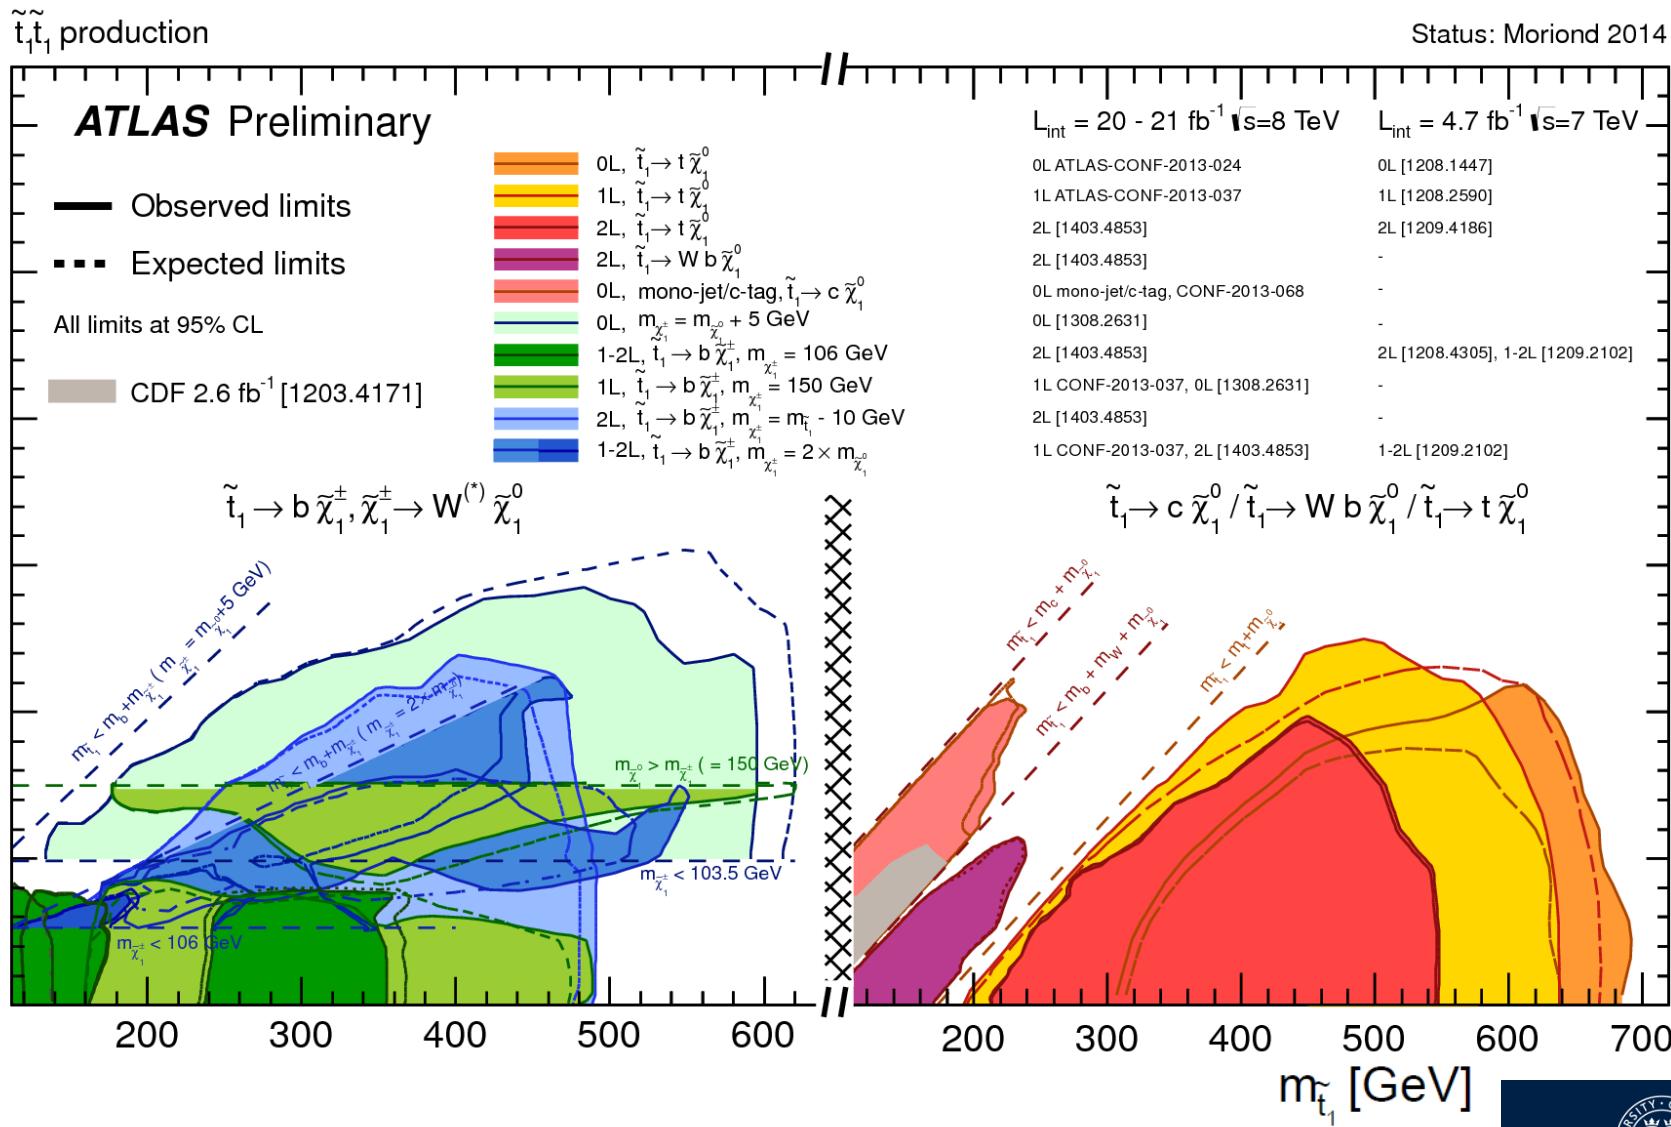

- High $p_T Z$ boson (at least 2L SFOS)
- (3rd lepton requirement reduces $t\bar{t}$ bckg)
- $\geq 1 b$ -jet; large number of jets
- Missing E_T

Also interpretation in a GMSB scenario exists.
