Physics with B to open charm decays

Tuesday, 6 May 2014 14:45 (15 minutes)

B \rightarrow DX decays provide a tree-diagram only determination of the angle γ of the CKM unitarity triangle, which remains the least precisely measured parameter of the CKM mixing matrix. While several new results provide updated measurements of this angle, some decay channels with sensitivity to γ have only recently been observed. Other measurements in the rich B to open charm phenomenology are also presented.
