

Top quark properties (including mass) at CMS

Phenomenology 2014 Symposium

06 May 2013

Yanjun Tu (UCSD)
on behalf of the
CMS collaboration

Heaviest elementary particle known

- ▶ Produced at the LHC predominantly through strong interactions - high production rate
- ▶ Decays predominantly through $t \rightarrow bW$
- ▶ Decays before hadronization - access spin information via its decay products

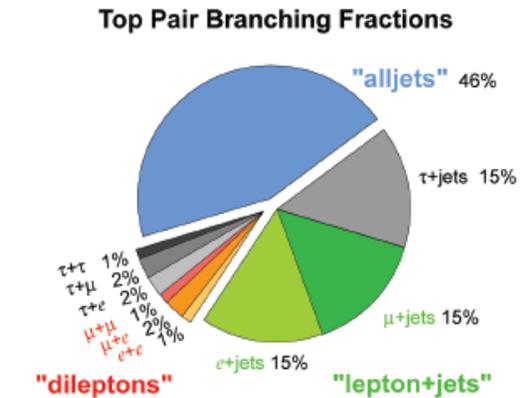

▶ Test Standard Model predictions

- ▶ Mass, couplings, and other properties have been measured precisely at the LHC

▶ Probe to new physics

- ▶ Large couplings to the Higgs boson
- ▶ Special role in the EW symmetry breaking in many new physics scenarios

x-sec (pb)	ttbar
Tevatron	7.08 (+0.00-0.24) (+0.36-0.27) approx. NNLO
LHC @ 7TeV	163 (+7-5)(±9) approx. NNLO
LHC @ 8TeV	234 (+10-7)(±12) approx. NNLO

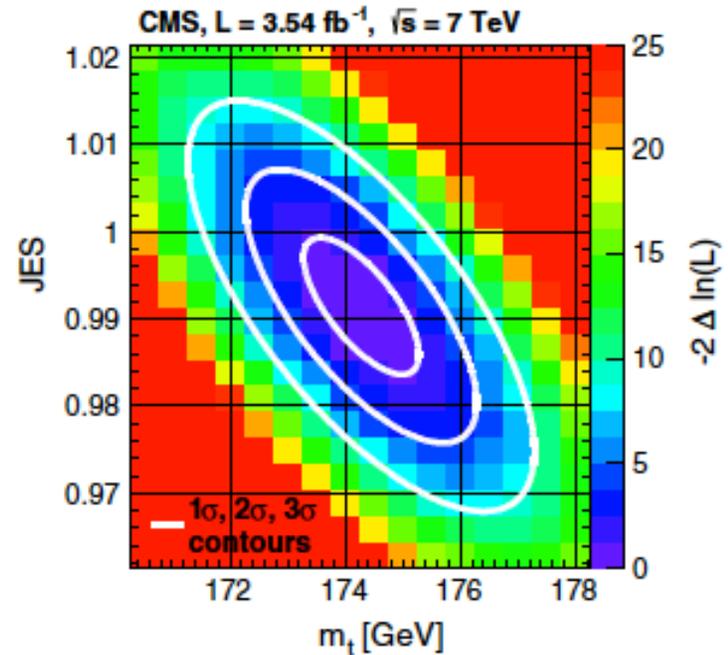

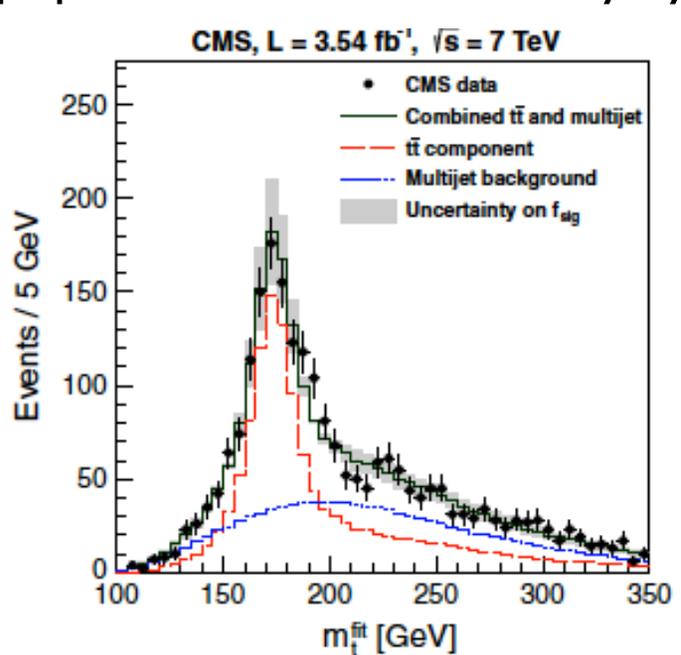

Outline:

- ▶ Top mass
- ▶ TTbar spin correlation and top polarization
- ▶ Top pair charge asymmetry
- ▶ W helicity in top decays
- ▶ Search for anomalous couplings
- ▶ TTbar association production with photon

- ▶ **2011 dataset at $\sqrt{s} = 7$ TeV: 3.54/fb**
- ▶ At least 6 jets, at least two of them are b-tagged
- ▶ Kinematic fit with the constraints that the reconstructed masses of two tops are equal and the mass of both W bosons is 80.4 GeV
- ▶ Cuts on the goodness of fit probability and separation of the two b jets are applied
- ▶ Ideogram method uses a likelihood function that allows the determination of the JES and the top quark mass simultaneously by a joint fit to all events in data

CMS-TOP-11-017
 EPJC 74 (2014) 2758

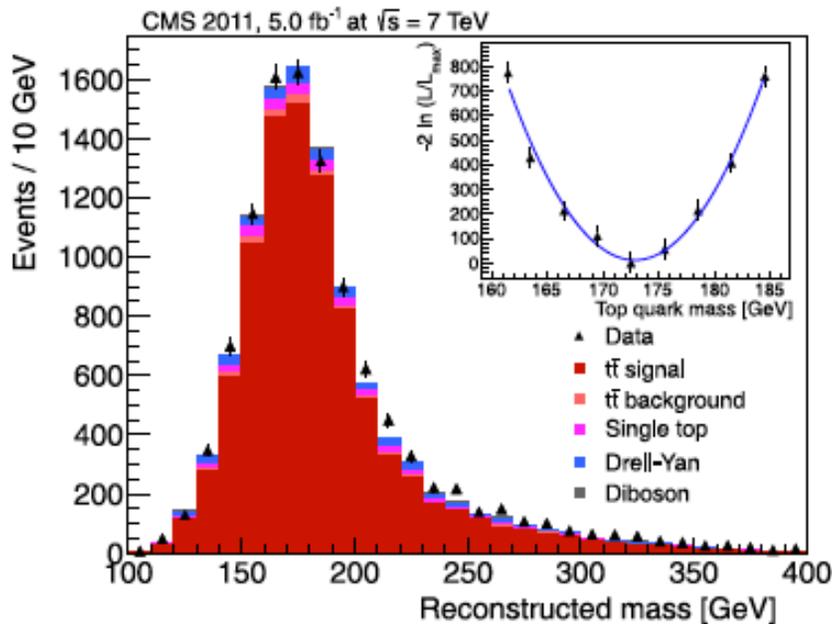

$$M_t = 173.49 \pm 0.69(\text{stat}) \pm 1.21(\text{syst}) \text{ GeV (Fixed JES)}$$

$$2\text{D Fit Results: } m_t = 174.28 \pm 1.00(\text{stat} + \text{JES}) \pm 1.23(\text{syst}) \text{ GeV and } \text{JES} = 0.991 \pm 0.008(\text{stat}) \pm 0.013(\text{syst})$$

- ▶ **Full 2011 dataset at $\sqrt{s} = 7$ TeV: 5.0/fb**
- ▶ Two isolated leptons, at least two jets (at least one b-tagged jet), MET
- ▶ Analytical Matrix Weighting Technique: the kinematic equations are solved many times per event using a series of top-quark mass hypotheses **between 100 and 400 GeV in 1 GeV steps.**
- ▶ Each solution is weighted according to top mass hypothesis and lepton momenta

CMS-TOP-11-016
 EPJC 72 (2012) 2202

- ▶ For each event, the mass hypothesis with maximum weight is chosen
- ▶ For each value of M_t , a likelihood is computed by comparing the reconstructed mass distribution in data with the expectation in simulation

$$M_t = 172.5 \pm 0.4(\text{stat}) \pm 1.5(\text{syst}) \text{ GeV}$$

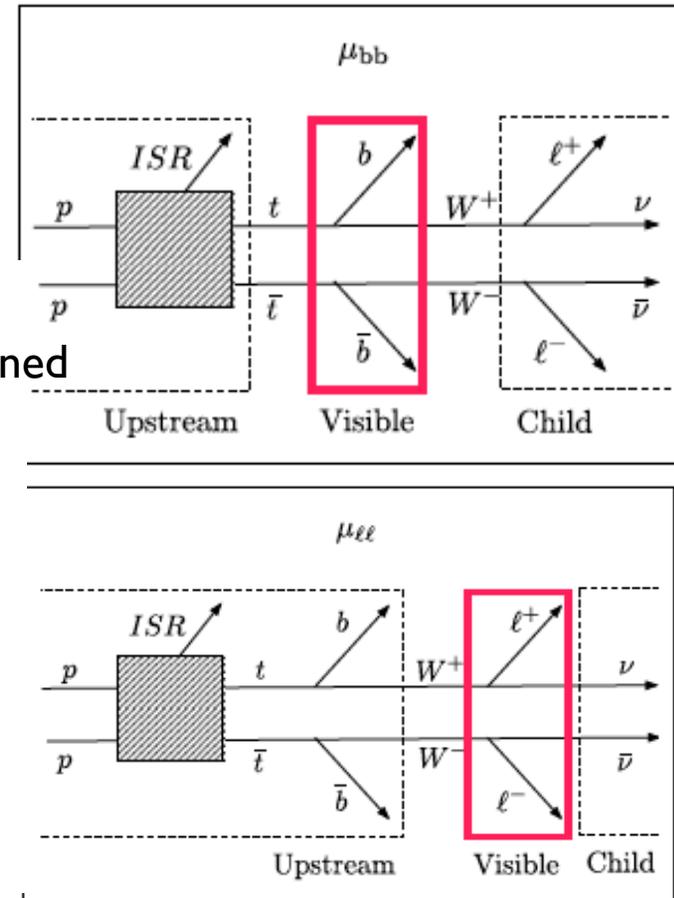

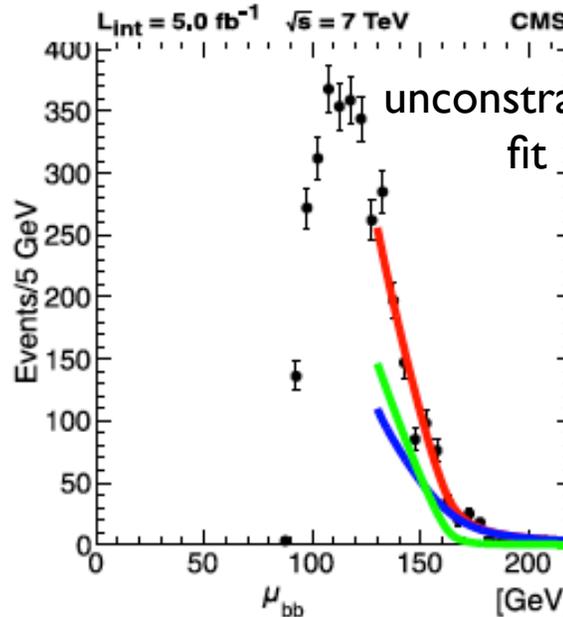

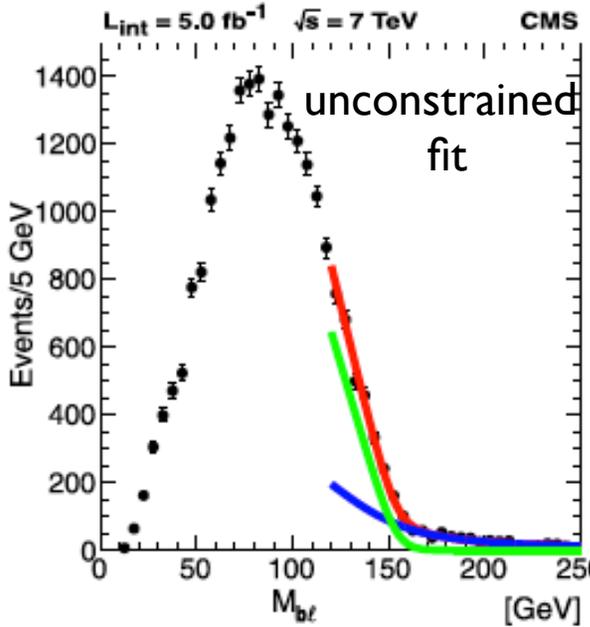

- ▶ Full 2011 dataset at $\sqrt{s} = 7 \text{ TeV}$: 5.0/fb
- ▶ Two isolated leptons, at least two b-tagged jets, MET
- ▶ Technique is based on edges of M_{T2} distributions
- ▶ M_{ν}^2 , M_W and M_t are obtained in a simultaneous fit to three endpoints

μ_{bb} : lower bound of m_t for known m_W

μ_{ll} : endpoint is the W boson mass at $m_{\nu} = 0$

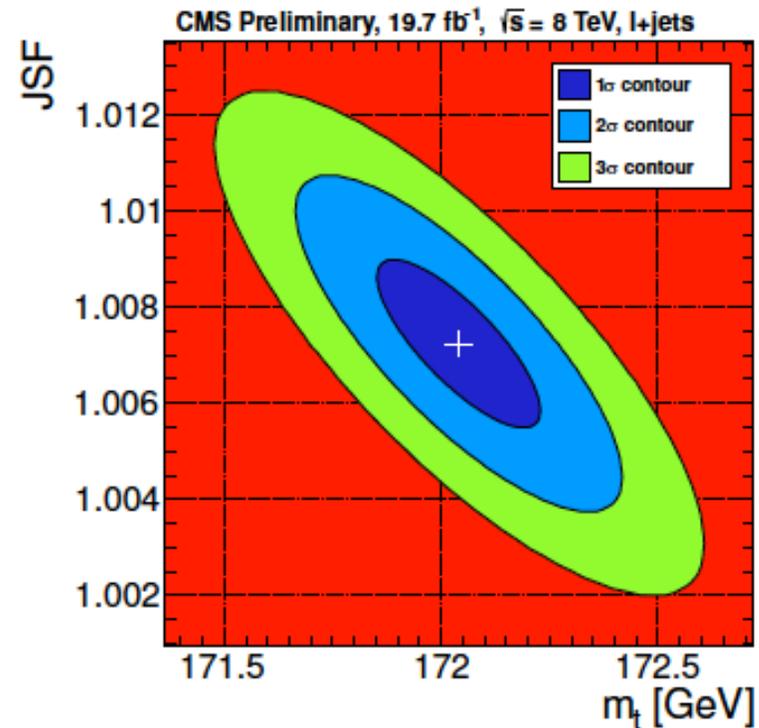

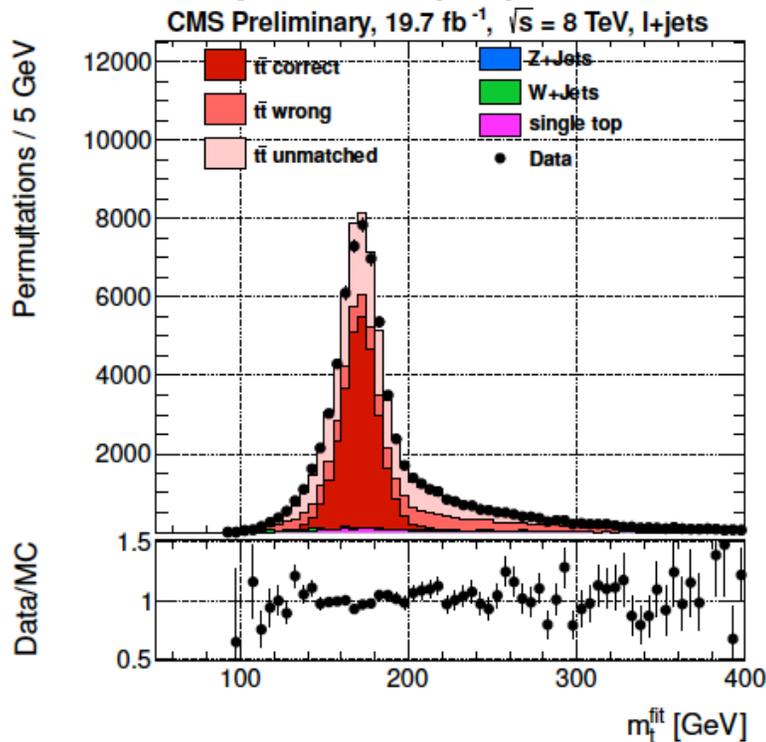

M_{bl} : endpoint is $\sqrt{(m_t^2 - m_W^2)(m_W^2 - m_{\nu}^2)}/m_W$

CMS-TOP-11-027
EPIC 73 (2013) 2494

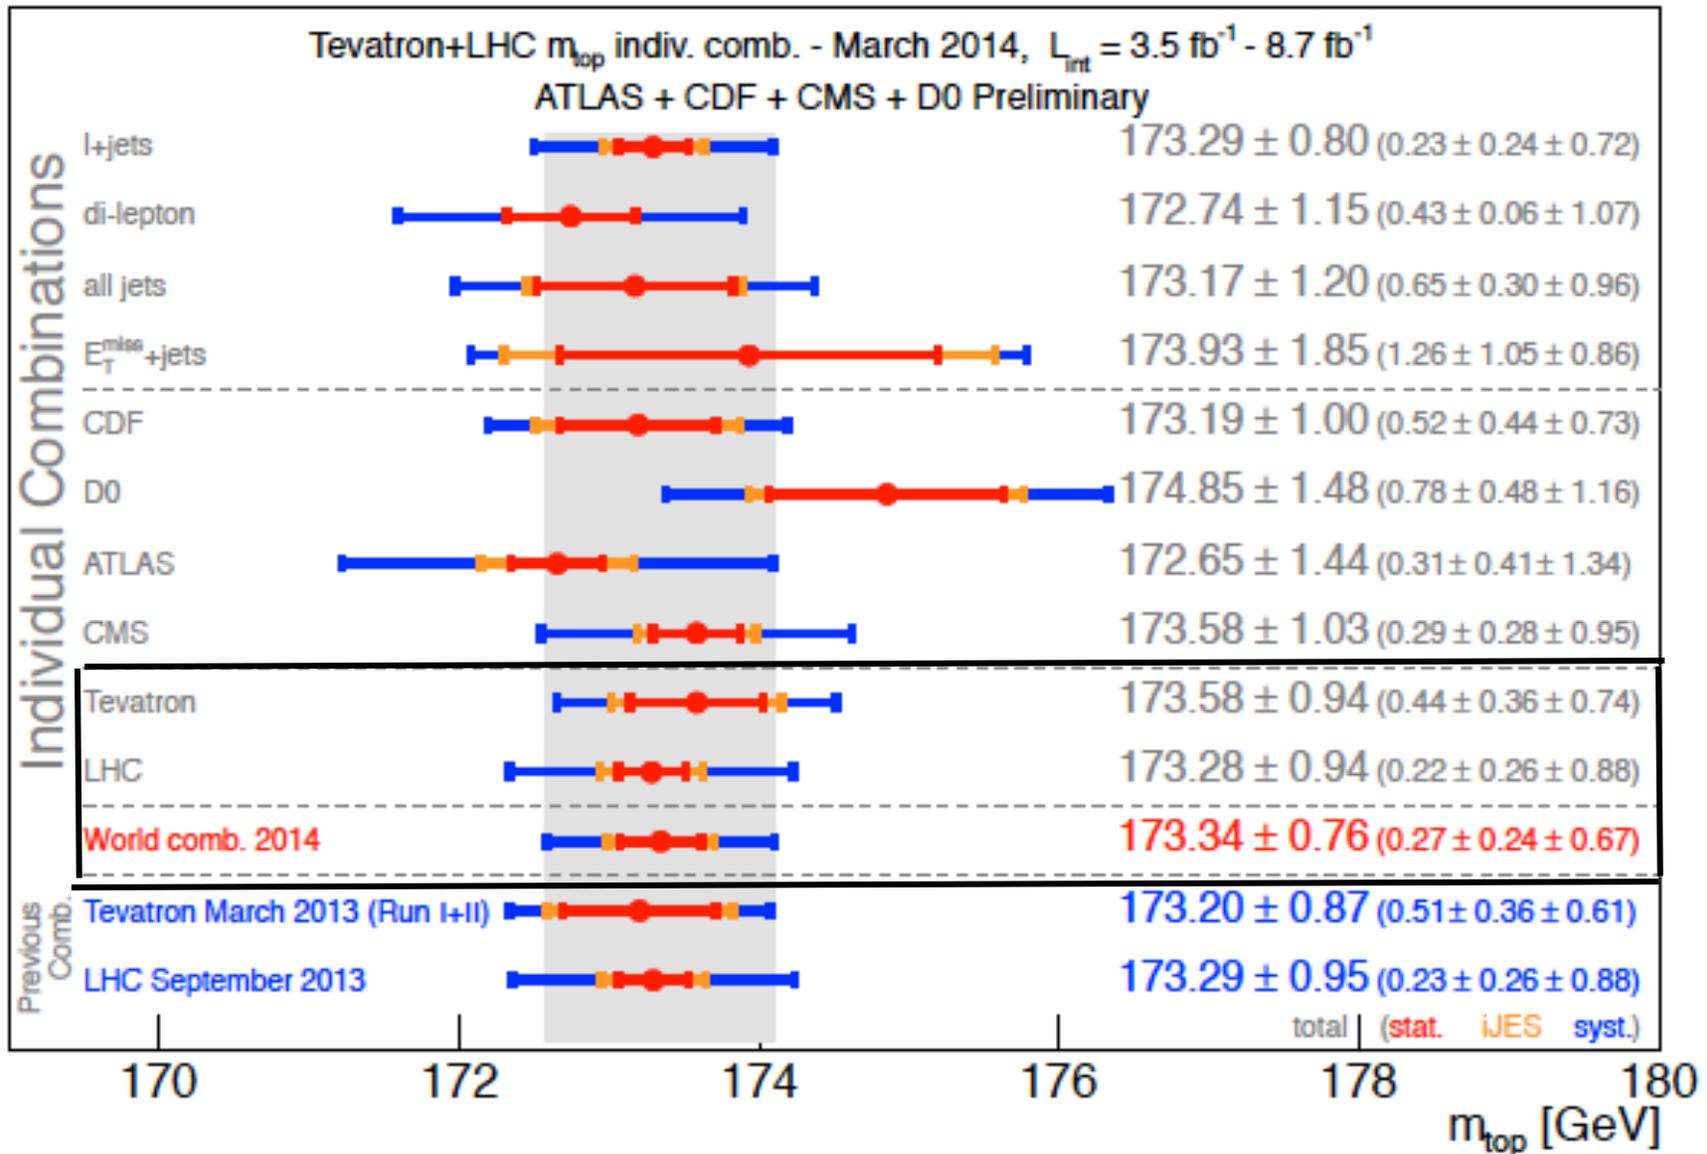

$$M_t = 173.9 \pm 0.9(\text{stat})^{+1.7}_{-2.1}(\text{syst}) \text{ GeV} - \text{fixed } M_W \text{ and } M_{\nu}^2$$

- ▶ **Full 2012 dataset at $\sqrt{s} = 8$ TeV: 19.7/fb**
- ▶ One isolated lepton, at least 4 jets, two of them are b-tagged, MET
- ▶ A kinematic fit of the decay products to a $t\bar{t}$ hypothesis
- ▶ Ideogram method: 2D likelihood functions for each event to estimate simultaneously the top-quark mass and the jet energy scale factor (JSF)

$$m_t = 172.04 \pm 0.19(\text{stat+JSF}) \pm 0.75(\text{syst}) \text{ GeV}$$

$$\text{JSF} = 1.007 \pm 0.002(\text{stat}) \pm 0.012(\text{syst})$$

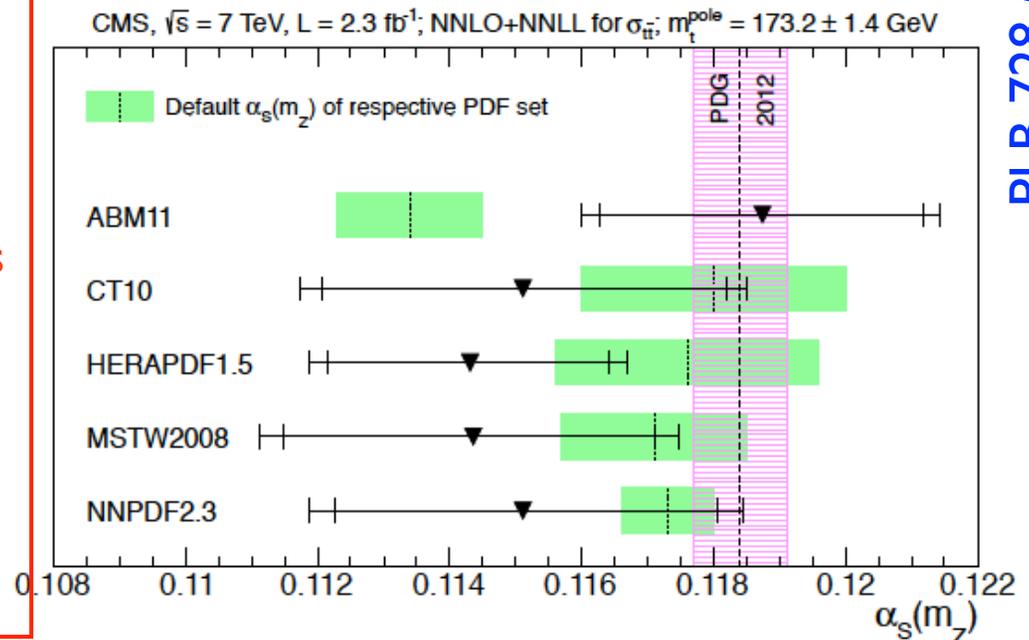

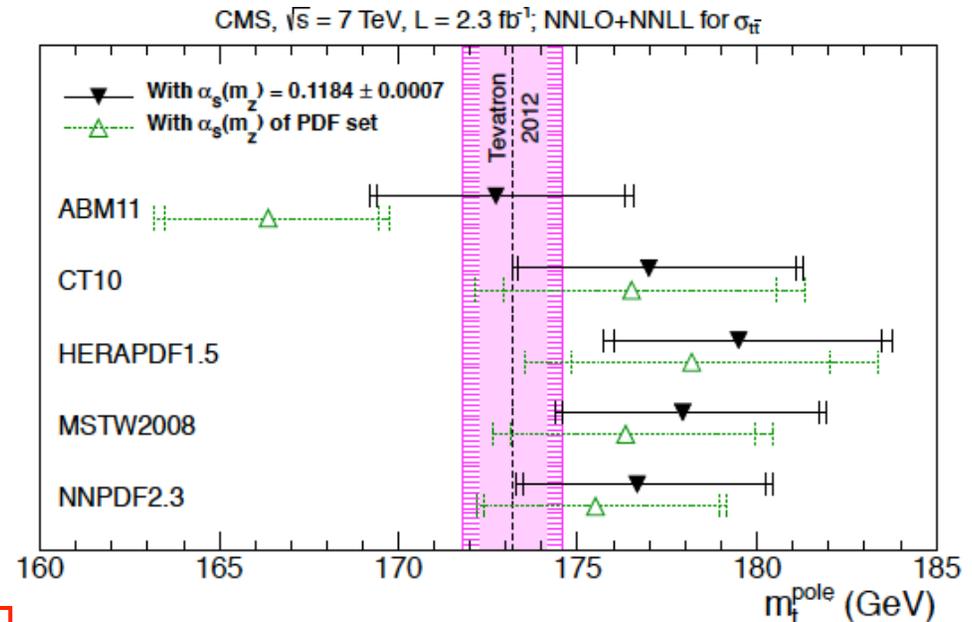

► **2011 dataset at $\sqrt{s} = 7$ TeV:
2.3/fb**

► The measured inclusive cross section for top-quark pair production is compared to the QCD prediction at NNLO to determine top pole mass or the strong coupling α_s

Observed cross section in the dilepton channel with 2.3/fb: 161.9 ± 6.7 pb

With the PDF set NNPDF2.3, $M_t = 176.7^{+3.8}_{-3.4}$ GeV when constraining α_s (M_Z) = 0.1184

$\alpha_s(M_Z) = 0.1151^{+0.0033}_{-0.0032}$ when constraining $M_t = 173.2$ GeV

- ▶ **Full 2011 dataset at $\sqrt{s} = 7$ TeV: 5/fb**
- ▶ Dilepton channel, **top kinematics reconstructed** using analytical matrix weighting technique (**AMWT**)
- ▶ An “**unfolding**” procedure is employed to correct acceptance and resolution effects
- ▶ In good agreement with the standard model predictions
