## Phenomenology in Non-minimal Universal Extra Dimensions

We present a model with universal extra dimensions in the presence of boundary localized kinetic terms for electoroweak gauge bosons. This model can realize that the lightest Kaluza-Klein particle is a mixture of KK  $B^1$  and KK  $W_3^1$ . Depending on boundary localized parameter  $(r_B, r_W)$  the KK dark matter is more like KK Z or KK photon. We showed current bounds on  $(r_B, r_W)$  from EWPT by 4-Fermi interaction operators.

## **Summary**

In this work, we investigate boundary localized kinetic terms for electroweak gauge bosons. The mass matrix allows mixing between two KK neutral gauge bosons. In general, the LKP becomes a mixture of KK  $B^1$  and KK  $W_3^1$ . We found a stringent bounds on  $R^{-1}$  or equivalently mass of LKP from 4-Fermi operators in  $r_W$ ,  $r_B$  plane.
