## Content

I would like to thank the organisers for inviting me
and for assigning me to talk on inclusive $b \rightarrow \mathrm{sl}^{+} \mathrm{l}^{-}$

- since I worked on the low $\mathrm{q}^{2}$ region (and only on the perturbative calculations)

Yet LHCb can only measure the high $\mathrm{q}^{2}$ region:

- since I worked on the low $\mathrm{q}^{2}$ region (and only on the perturbative calculations)

Yet LHCb can only measure the high $\mathrm{q}^{2}$ region:
So instead of talking about things I have forgotten

## Content

I would like to thank the organisers for inviting me
and for assigning me to talk on inclusive $\mathrm{b} \rightarrow \mathrm{sl}^{+} \mathrm{l}^{-}$

- since I worked on the low $q^{2}$ region (and only on the perturbative calculations)

Yet LHCb can only measure the high $\mathrm{q}^{2}$ region:
So instead of talking about things I have forgotten
I will talk about things I never worked on.

## $\mathrm{H}_{\mathrm{eff}}$ for $\mathrm{b} \rightarrow \mathrm{sl}^{+} \mathrm{l}^{-}$

$\mathcal{H}_{e f f}=-\frac{G_{F}}{\sqrt{2}} V_{t s}^{*} V_{t b}\left[\sum_{i=1}^{8} C_{i}(\mu) Q_{i}+\frac{\alpha}{2 \pi} \tilde{C}_{9}(\mu)(\bar{s} b)_{V-A}(\bar{l})_{V}+\frac{\alpha}{2 \pi} \tilde{C}_{10}(\bar{s} b)_{V-A}(\bar{l})_{A}\right]$

We know the Standard Model $H_{\text {eff }}$ for $\mathrm{b} \rightarrow \mathrm{sl}^{+} \mathrm{l}^{-}$including NNLO QCD + some QED and Electroweak corrections.

The relevant Wilson Coefficients $\mathrm{C}_{7}, \mathrm{C}_{10} \& \mathrm{C}_{9}$ are constrained from $B \rightarrow X_{s} \gamma, B_{s} \rightarrow \mu^{+} \mu^{-} \& B \rightarrow K^{(*)} l^{+} l^{-}$.

What can we learn from $B \rightarrow X_{s} 1^{+} l^{-}$, or $\mathrm{H}_{\mathrm{b}} \rightarrow \mathrm{X}^{+} \mathrm{l}^{-}$?
Inclusive decays are thought to be theoretically clean.

## Differential Branching Fraction

For an inclusive quantity we use the optical theorem
$\operatorname{Im} \mathrm{M}(\mathrm{A} \rightarrow \mathrm{A}) \propto \Sigma_{\mathrm{x}} \Gamma(\mathrm{A} \rightarrow \mathrm{X})$
For B Physics: $\operatorname{Im} \mathrm{M}(\mathrm{B} \rightarrow \mathrm{B})$

## Differential Branching Fraction

For an inclusive quantity we use the optical theorem
$\operatorname{Im} \mathrm{M}(\mathrm{A} \rightarrow \mathrm{A}) \propto \Sigma_{\mathrm{x}} \Gamma(\mathrm{A} \rightarrow \mathrm{X})$

For B Physics: $\operatorname{Im} \mathrm{M}(\mathrm{B} \rightarrow \mathrm{B})$
$\leadsto$ two operator insertions

## Differential Branching Fraction

For an inclusive quantity we use the optical theorem
$\operatorname{Im} \mathrm{M}(\mathrm{A} \rightarrow \mathrm{A}) \propto \Sigma_{\mathrm{x}} \Gamma(\mathrm{A} \rightarrow \mathrm{X})$

For B Physics: $\operatorname{Im} \mathrm{M}(\mathrm{B} \rightarrow \mathrm{B})$
$\leadsto$ two operator insertions
$\curvearrowleft$ Operator Product Expansion

## Differential Branching Fraction

For an inclusive quantity we use the optical theorem
$\operatorname{Im} \mathrm{M}(\mathrm{A} \rightarrow \mathrm{A}) \propto \Sigma_{\mathrm{X}} \Gamma(\mathrm{A} \rightarrow \mathrm{X})$

For B Physics: $\operatorname{Im} \mathrm{M}(\mathrm{B} \rightarrow \mathrm{B})$
$\leadsto$ two operator insertions
$\Rightarrow$ Operator Product Expansion
$\Gamma(B \rightarrow X)=$ Parton $+\Lambda / \mathrm{m}_{\mathrm{b}}$

## Quark-hadron duality not expected to hold

Discussed e.g. by BBNS [0902.4446] using a toy model $B \rightarrow X_{s} l^{+} l^{-}$is not inclusive
$\mathcal{H}_{e f f}=\frac{G}{\sqrt{2}}\left[\left(\bar{l}_{2} l_{1}\right)_{V-A}(\bar{c} c)_{V-A}-\left(\bar{l}_{2} l_{1}\right)_{V-A}(\bar{t} t)_{V-A}\right] \xi_{i n}^{c} e_{e}^{c}$

## Quark-hadron duality not expected to hold

Discussed e.g. by BBNS [0902.4446] using a toy model
$B \rightarrow X_{s} 1^{+} 1^{-}$is not inclusive

$$
\mathcal{H}_{e f f}=\frac{G}{\sqrt{2}}\left[\left(\bar{l}_{2} l_{1}\right)_{V-A}(\bar{c} c)_{V-A}-\left(\bar{l}_{2} l_{1}\right)_{V-A}(\bar{t} t)_{V-A}\right]
$$

For B $\rightarrow \mathrm{X}_{\mathrm{s}} \mathrm{l}^{+} \mathrm{l}^{-}$

$$
R_{\psi} \equiv \frac{\mathrm{B}\left(B \rightarrow X_{s} \psi \rightarrow X_{s} l^{+} l^{-}\right)}{\mathrm{B}\left(B \rightarrow X_{s} l^{+} l^{-}\right)_{\mathrm{SD}}}=\frac{512 \pi^{5} \kappa^{2} a_{2}^{2}(1-r)^{2}(1+2 r)}{\left.9\left(\left.\langle | C_{9}\right|^{2}\right\rangle+\left|C_{10}\right|^{2}\right)} \times \frac{f_{\psi}^{2}}{m_{b}^{2}} \times \frac{f_{\psi}^{2}}{M_{\psi} \Gamma_{\psi}}
$$

Gives $\mathrm{R}_{\Psi} \approx 93$, also $R_{\rho} \approx[10-50] \times \frac{f_{\rho}^{2}}{m_{b}^{2}} \times \frac{f_{\rho}^{2}}{M_{\rho} \Gamma_{\rho}} \approx[0.007-0.036]$
What about higher $\Psi$ resonances?

# $\mathrm{B} \rightarrow \mathrm{X}_{\mathrm{s}} \mathrm{l}^{+}$l- Ignoring Charm Resonances $^{\text {Con }}$

## OPE up to $O\left(\Lambda^{2} / m_{b}{ }^{2}\right)$

Neglecting $\mathrm{C}_{7}$ we only need the OPE for $\mathrm{W}_{9}$

$$
\begin{aligned}
& \frac{3}{4 \pi m_{b} M_{B}} \int d x d y L_{\mu \nu}^{S} W_{9}^{\mu \nu}=\left(1+\frac{\lambda_{1}}{2 m_{b}^{2}}\right)(1-s)^{2}(1+2 s) \\
& \text { [Ali et. al. `97] - see } \\
& \text { also [hep-ph/9801456] } \\
& +\frac{3 \lambda_{2}}{2 m_{b}^{2}}\left(1-15 s^{2}+10 s^{3}\right), \\
& \lambda_{1}=\frac{\langle B| \bar{h}(i D)^{2} h|B\rangle}{2 M_{B}}, \\
& \lambda_{2}=\frac{1}{6} \frac{\langle B| \bar{h} g \sigma \cdot G h|B\rangle}{2 M_{B}}=\frac{M_{B^{*}}^{2}-M_{B}^{2}}{4}
\end{aligned}
$$

# OPE up to $\mathrm{O}\left(\Lambda^{2} / \mathrm{m}_{\mathrm{b}}{ }^{2}\right)$ 

Neglecting $\mathrm{C}_{7}$ we only need the OPE for $\mathrm{W}_{9}$

$$
\begin{aligned}
& \frac{3}{4 \pi m_{b} M_{B}} \int d x d y L_{\mu \nu}^{S} W_{9}^{\mu \nu}=\left(1+\frac{\lambda_{1}}{2 m_{b}^{2}}\right)(1-s)^{2}(1+2 s) \\
& \text { [Ali et. al. `97] - see } \\
& \text { also [hep-ph/9801456] } \\
& +\frac{3 \lambda_{2}}{2 m_{b}^{2}}\left(1-15 s^{2}+10 s^{3}\right), \\
& \lambda_{1}=\frac{\langle B| \bar{h}(i D)^{2} h|B\rangle}{2 M_{B}}, \\
& \lambda_{2}=\frac{1}{6} \frac{\langle B| \bar{h} g \sigma \cdot G h|B\rangle}{2 M_{B}}=\frac{M_{B^{*}}^{2}-M_{B}^{2}}{4}
\end{aligned}
$$

For $s \rightarrow 1$ we have [Ali et. al. `97]:

$$
(1-s)^{2}(1+2 s) \rightarrow 0 \text { and }\left(1-15 s^{2}+10 s^{3}\right) \rightarrow-4
$$

# OPE up to $\mathrm{O}\left(\Lambda^{2} / \mathrm{m}_{\mathrm{b}}^{2}\right)$ 

Neglecting $\mathrm{C}_{7}$ we only need the OPE for $\mathrm{W}_{9}$

$$
\begin{array}{cc}
\frac{3}{4 \pi m_{b} M_{B}} \int d x d y L_{\mu \nu}^{S} W_{9}^{\mu \nu} & =\left(1+\frac{\lambda_{1}}{2 m_{b}^{2}}\right)(1-s)^{2}(1+2 s) \\
\text { [Ali et. al. `97] - see } \\
\text { also [hep-ph/9801456] } & +\frac{3 \lambda_{2}}{2 m_{b}^{2}}\left(1-15 s^{2}+10 s^{3}\right), \\
\lambda_{1}=\frac{\langle B| \bar{h}(i D)^{2} h|B\rangle}{2 M_{B}}, \quad \lambda_{2}= & \frac{1}{6} \frac{\langle B| \bar{h} g \sigma \cdot G h|B\rangle}{2 M_{B}}=\frac{M_{B^{*}}^{2}-M_{B}^{2}}{4}
\end{array}
$$

For $s \rightarrow 1$ we have [Ali et. al. `97]:

$$
(1-s)^{2}(1+2 s) \rightarrow 0 \text { and }\left(1-15 s^{2}+10 s^{3}\right) \rightarrow-4
$$

Breakdown of the OPE for high $q^{2}$ region

Breakdown of OPE

## Breakdown of OPE

Breakdown expected - for high $\mathrm{q}^{2}$ there is no hard scale and the $X_{s}$ meson has very low momentum

## Breakdown of OPE

Breakdown expected - for high $\mathrm{q}^{2}$ there is no hard scale and the $X_{s}$ meson has very low momentum

The s momentum is $\mathrm{k} \approx \Lambda, \mathrm{k}^{2} \approx \Lambda^{2} \mathrm{k}$ and the strange propagator is $1 / \Lambda^{2}$.

## Breakdown of OPE

Breakdown expected - for high $\mathrm{q}^{2}$ there is no hard scale and the $X_{s}$ meson has very low momentum

The s momentum is $\mathrm{k} \approx \Lambda, \mathrm{k}^{2} \approx \Lambda^{2} \mathrm{k}$ and the strange propagator is $1 / \Lambda^{2}$.

Only finite number of final states at high $q^{2}$ endpoint Buchalla Isidori: HHChPT for $\mathrm{B} \rightarrow \mathrm{K} \mathrm{l}^{+} \mathrm{l}^{-}, \mathrm{B} \rightarrow \mathrm{K} \pi \mathrm{l}^{+} \mathrm{l}^{-}$

## Breakdown of OPE

$$

## Normalisation

$\Lambda / m_{b}$ expansion of $B \rightarrow X_{u} l v$ equals the one of $W_{9}$ (Up to $\Lambda^{3} / \mathrm{m}_{\mathrm{b}}{ }^{3}$ and for $\mathrm{m}_{\mathrm{s}}=\mathrm{m}_{\mathrm{u}}$ )

## Normalisation

$\Lambda / m_{b}$ expansion of $B \rightarrow X_{u} l v$ equals the one of $W_{9}$ (Up to $\Lambda^{3} / \mathrm{m}_{\mathrm{b}}{ }^{3}$ and for $\mathrm{m}_{\mathrm{s}}=\mathrm{m}_{\mathrm{u}}$ )

Non-perturbative uncertainties will cancel in the ratio Tackmann et. al. see [0707.1694]

$$
\frac{\int_{q_{0}^{2}}^{m_{B}^{2}} \frac{\mathrm{~d} \Gamma\left(B \rightarrow X_{s} \ell^{+} \ell^{-}\right)}{\mathrm{d} q^{2}}}{\int_{q_{0}^{2}}^{m_{B}^{2}} \frac{\mathrm{~d} \Gamma\left(B \rightarrow X_{u} \ell \bar{\nu}\right)}{\mathrm{d} q^{2}}}=\frac{\left|V_{t b} V_{t s}^{*}\right|^{2}}{\left|V_{u b}\right|^{2}} \frac{\alpha_{\mathrm{em}}^{2}}{8 \pi^{2}} \mathcal{R}\left(q_{0}^{2}\right)
$$

## Numbers

Normalising to $B \rightarrow X_{u} l^{+} v$ with with the same $q^{2}$ cut Ligeti and Tackmann find [0707.1694]

$$
\begin{aligned}
\mathcal{R}\left(14 \mathrm{GeV}^{2}\right)= & \mathcal{C}_{9}^{2}+\mathcal{C}_{10}^{2}+4.79 \mathcal{C}_{7}^{2}+4.31 \mathcal{C}_{7} \mathcal{C}_{9} \\
& +1.06 \mathcal{C}_{9}+2.24 \mathcal{C}_{7}+0.95 \\
\mathcal{R}\left(15 \mathrm{GeV}^{2}\right)= & \mathcal{C}_{9}^{2}+\mathcal{C}_{10}^{2}+4.27 \mathcal{C}_{7}^{2}+4.10 \mathcal{C}_{7} \mathcal{C}_{9} \\
& +0.97 \mathcal{C}_{9}+1.91 \mathcal{C}_{7}+0.93
\end{aligned}
$$

## Numbers

Normalising to $B \rightarrow X_{u} l^{+} v$ with with the same $q^{2}$ cut Ligeti and Tackmann find [0707.1694]

$$
\begin{aligned}
\mathcal{R}\left(14 \mathrm{GeV}^{2}\right)= & \mathcal{C}_{9}^{2}+\mathcal{C}_{10}^{2}+4.79 \mathcal{C}_{7}^{2}+4.31 \mathcal{C}_{7} \mathcal{C}_{9} \\
& +1.06 \mathcal{C}_{9}+2.24 \mathcal{C}_{7}+0.95 \\
\mathcal{R}\left(15 \mathrm{GeV}^{2}\right)= & \mathcal{C}_{9}^{2}+\mathcal{C}_{10}^{2}+4.27 \mathcal{C}_{7}^{2}+4.10 \mathcal{C}_{7} \mathcal{C}_{9} \\
& +0.97 \mathcal{C}_{9}+1.91 \mathcal{C}_{7}+0.93
\end{aligned}
$$

With small theory uncertainties:

$$
\begin{aligned}
\mathcal{R}\left(14 \mathrm{GeV}^{2}\right)=35.55(1 & \pm 0.046_{\left[f_{u, s}\right]} \pm 0.012_{\left[\lambda_{2}, \rho_{1}\right]} \\
& \pm 0.054_{[\mu]} \pm 0.030_{\left[\mathcal{C}_{i}\right]}, \\
\mathcal{R}\left(15 \mathrm{GeV}^{2}\right)=35.42(1 & \pm 0.065_{\left[f_{u, s}\right]} \pm 0.016_{\left[\lambda_{2}, \rho_{1}\right]} \\
& \left. \pm 0.051_{[\mu]} \pm 0.030_{\left[\mathcal{C}_{i}\right]}\right) .
\end{aligned}
$$

## Questions

But only if we normalise to the corresponding $b \rightarrow u$ semileptonic decay with the same $q^{2}$ cut.

Would the required normalisation channels be present?
Nearly equal mixture of $\Lambda_{\mathrm{b}}, \mathrm{B}_{\mathrm{s}}, \mathrm{B}^{+} \& \mathrm{~B}^{0}$ in the initial state.
Also: The breakdown of the OPE is different in
$B \rightarrow X_{u} l^{+} v$ and $B \rightarrow X_{u} l^{+} l^{-}$, also $m_{s} \neq m_{u}$

# Low $q^{2}$ and Conclusions 

The OPE works much better at low $q^{2}$, but experimentally not accessible at LHCb?

Cuts introduce sensitivity to shape function - similar to $B \rightarrow X_{s} \gamma$.

Yet, the cuts could be removed - at least to some extent - at a Super Flavour Factory. What about the $\mathrm{b} \rightarrow \mathrm{c}\left(\rightarrow \mathrm{sl}^{+} v\right) \mathrm{l}^{-} \bar{v}$

My personal view: If we want to learn something about short distance physics the better region is low $q^{2}$.
