

“LHC Run 1 Results: Beyond Standard Model Scalar Boson”

Maxim Titov (CEA Saclay, France)

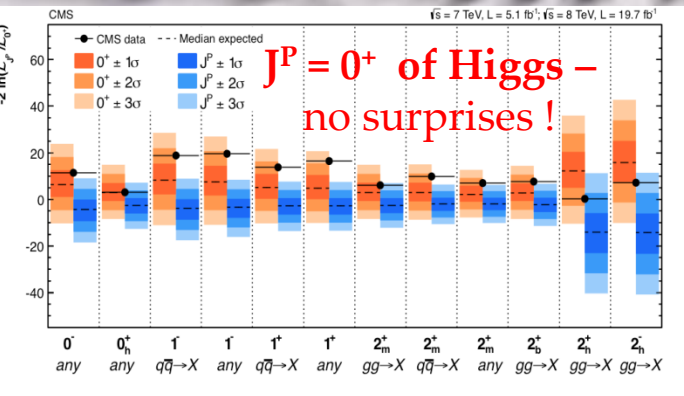

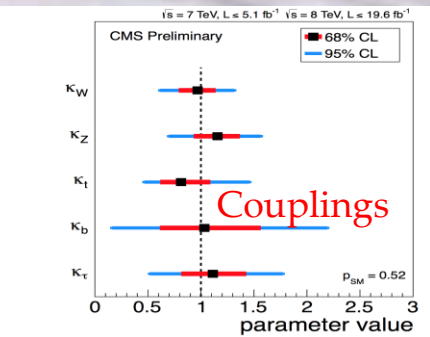

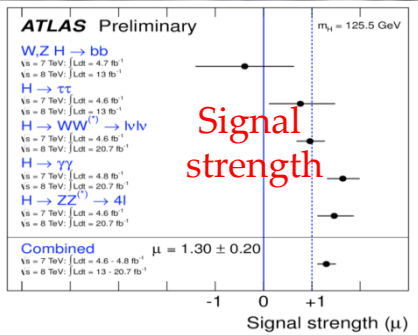

On behalf of the ATLAS and CMS Collaborations

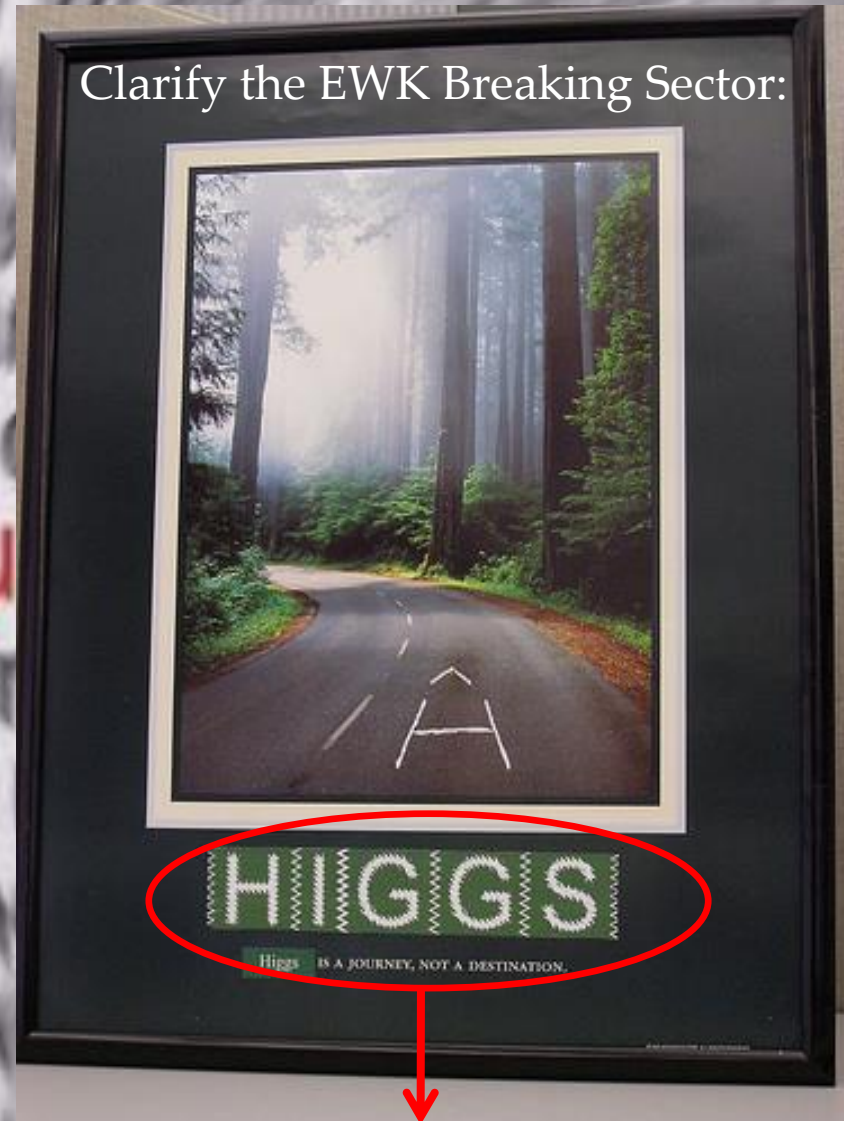

10^x Rencontres Du Vietnam “Physics at LHC and Beyond”
Quy Nhon Vietnam, August 10 – 17, 2014

Three Years of Remarkable LHC Operations: First Steps in an Incredible Journey

Clarify the EWK Breaking Sector:

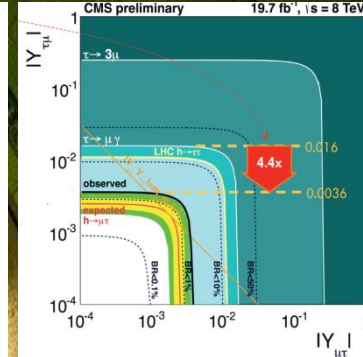

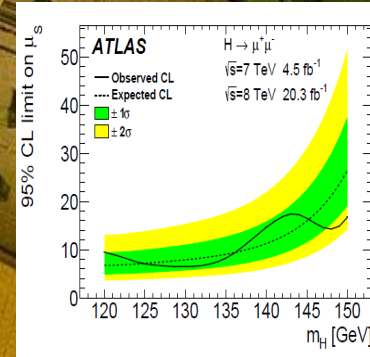

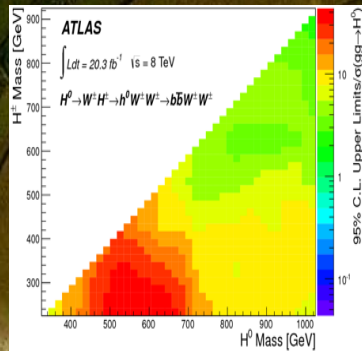

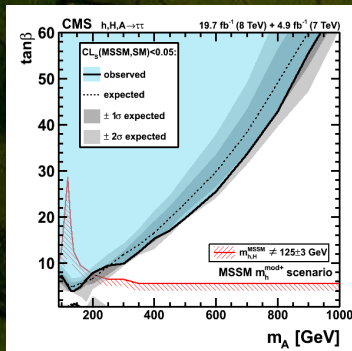

With the discovery of a Higgs boson,
the SM could be completed → and ...
it looks very much like “*the SM Higgs Boson* »

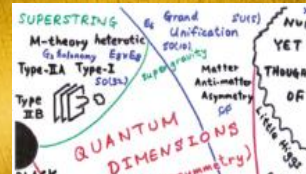

Higgs is a journey, not a destination

Is the SM Minimal ? (2HDM/MSSM, NMSSM Models, Multi-Higgs Cascades)

Rare Higgs Modes, FCNC, LFV Higgs Decays, Long-Lived Higgs

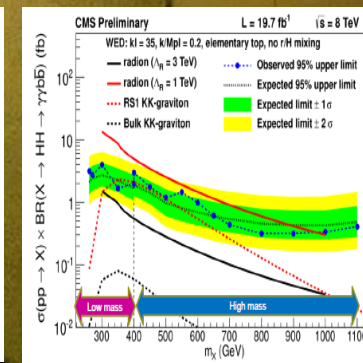

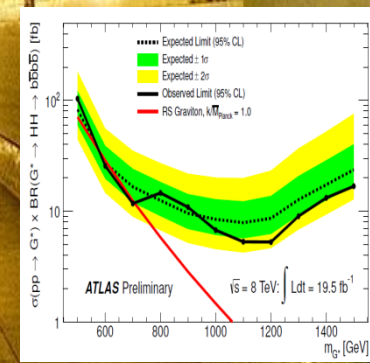

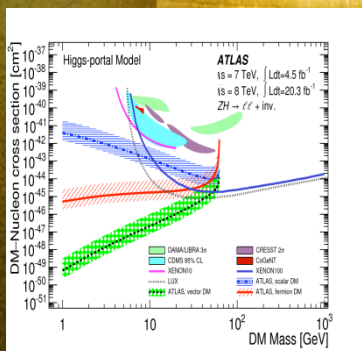

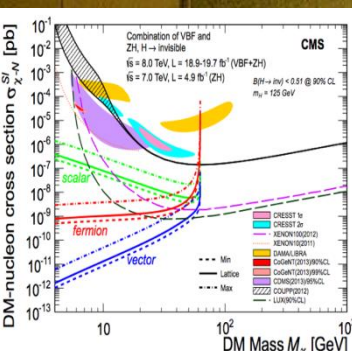

Higgs: A Portal to BSM

Tool for Discovery - Portal to DM
(invisible decays), hidden sectors

Higgs Boson Pair Production,
resonant searches, etc ...

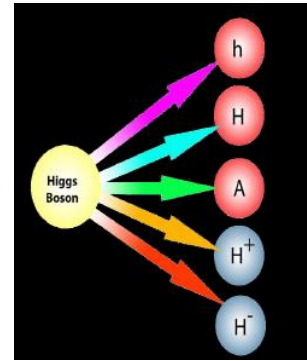

Two Higgs Doublet Models (2HDM)

➤ Effective theory; extension of SM by adding a second complex Higgs doublet

- **5 Higgs Bosons:** 2 CP-even neutral bosons: h (light) & H (heavy), 1 CP-odd neutral boson (A) and 2 charged bosons (H $^\pm$)
- **6 Parameters:** m_h, m_H, m_A, m_{H^\pm} ; α = mixing between h and H; $\tan\beta = \langle vev \rangle_u / \langle vev \rangle_d$ satisfying $\langle vev \rangle_u^2 + \langle vev \rangle_d^2 = (246 \text{ GeV})^2$

➤ Flavor conservation can be enforced via symmetries

➤ Four types of 2HDM, depending on the way the Higgs doublets couple

Type I: one doublet couples only with vector bosons [Fermiophobic], other only with fermions

Type II: one doublet couples with up-type quarks, other with down-type quarks and leptons [MSSM-like]

Type III: one doublet couples with quarks as in Type I, other with leptons as in Type II [lepton-specific]

Type IV: one doublet couples with quarks as in Type II, other with leptons as in Type I [Flipped]

2HDM with natural flavor conservation:

➤ MSSM: 2HDM Type II + SUSY sector

Coupling scale factor	Type I	Type II	Type III	Type IV
κ_V	$\sin(\beta - \alpha)$	$\sin(\beta - \alpha)$	$\sin(\beta - \alpha)$	$\sin(\beta - \alpha)$
κ_u	$\cos(\alpha) / \sin(\beta)$	$\cos(\alpha) / \sin(\beta)$	$\cos(\alpha) / \sin(\beta)$	$\cos(\alpha) / \sin(\beta)$
κ_d	$\cos(\alpha) / \sin(\beta)$	$-\sin(\alpha) / \cos(\beta)$	$\cos(\alpha) / \sin(\beta)$	$-\sin(\alpha) / \cos(\beta)$
κ_l	$\cos(\alpha) / \sin(\beta)$	$-\sin(\alpha) / \cos(\beta)$	$-\sin(\alpha) / \cos(\beta)$	$\cos(\alpha) / \sin(\beta)$

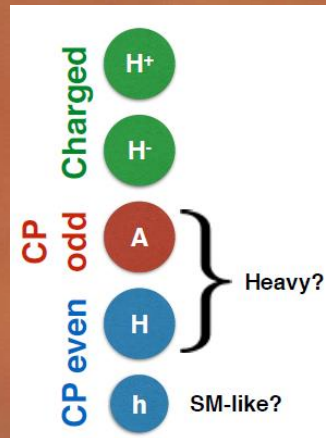

➤ NMSSM: MSSM+1 additional singlet

→ 7 Higgs bosons:
5 neutral h1, h2, h3 (CP even), a1, a2 (CP odd), 2 charged (H $^\pm$)

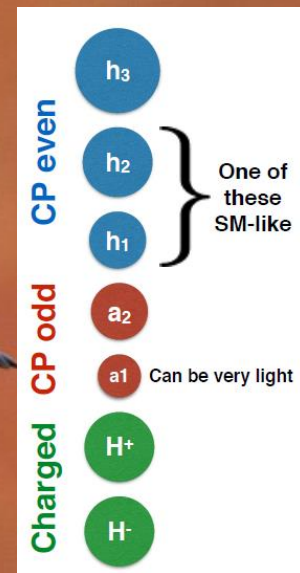

➤ Flavor-changing Yukawa couplings are in principle possible (Type III models)

Beyond the Standard Model Higgs Sector

2 HDM/
MSSM

Next-to-MSSM
Prospects
(NMSSM)

Pseudoscalars in Extended Higgs Sector:

Model	Higgs sector	CP-odd	SUSY partners
2HDM: Two-Higgs-Doublet-Model	Two doublets → 5 Higgs bosons (h, H, H ⁺ , H ⁻ , A)	A (heavy)	None
MSSM: Minimal Supersymmetric Standard Model	Two doublets → 5 Higgs bosons (h, H, H ⁺ , H ⁻ , A)	A (heavy)	+ sparticles
NMSSM: Next-to-minimal Supersymmetric Standard Model	Two doublets, one singlet → 7 Higgs bosons (h ₁ , h ₂ , h ₃ , H ⁺ , H ⁻ , a ₁ , a ₂)	a₁, a₂ (light)	+ sparticles

Summary of 2 HDM / MSSM and NMSSM Searches

*Results discussed in the talk (marked in magenta)

MSSM Landscape of the BSM Higgs Searches

Five Higgs Boson in MSSM:

→ CP-even (h, H); CP-odd (A), H^{\pm} : assume 125 GeV is light CP-even Higgs in 2HDM?

arXiv: hep-ph/0503173

FeynHiggs 2.5

In m_h^{\max} : $m_h \approx 130$ GeV.

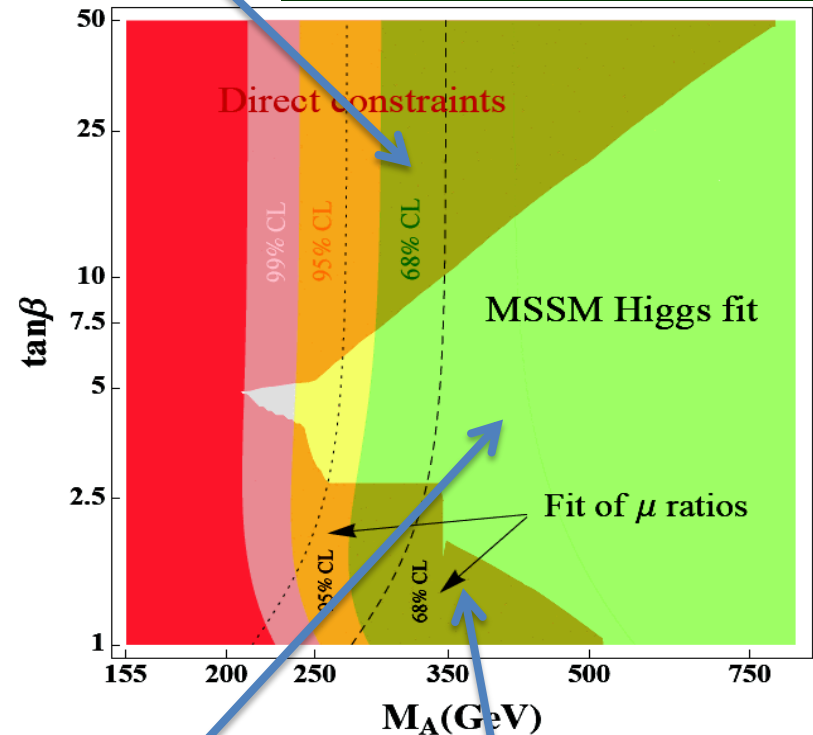

→ Move to new scenarios with $m_h \approx 125$ GeV.

6 New MSSM Benchmark Scenarios:

- ❖ Proposed by M. Carena et al., Eur. Phys. J. C73, 2552(2013)
- ❖ Each addressing certain phenomenology

❖ High $\tan\beta$: $\phi \rightarrow \tau\tau$, $\phi \rightarrow \mu\mu$; $H^+ \rightarrow \tau\nu$, tb

A. Djouadi et al., arXiv: 1307.5205

❖ Intermediate $\tan\beta$:

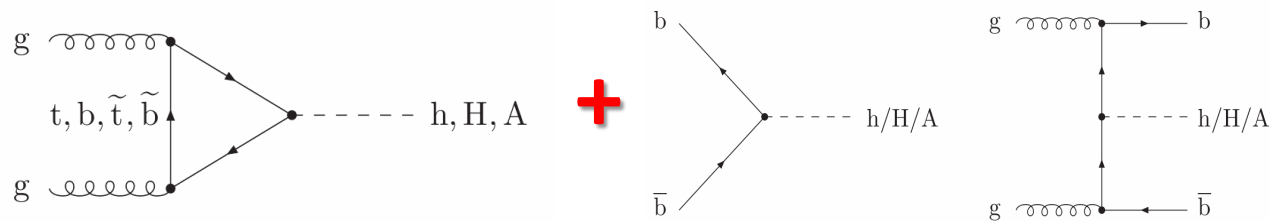

$$H/A \rightarrow \chi_i^0 \chi_j^0, \chi_i^+ \chi_j^-; H^+ \rightarrow \chi_i^+ \chi_j^0$$

❖ Low $\tan\beta$: $A \rightarrow Zh$; $H \rightarrow hh$, tt ;

$$H^+ \rightarrow cs, cb, \tau\nu, tb, Wh$$

Neutral MSSM Higgs Boson $\phi(h, H, A)$ Searches

Production via gluon fusion (b-, t- loops) and associated b-quark annihilation

➤ 2 HDM and Fermions: enhanced coupling to b-quarks and τ -leptons

($g_{bbH}^{\widetilde{MSSM}} = \tan \beta \cdot g_{bbH}^{SM}$) ➤ production rate enhanced $\times \tan^2 \beta$; associated production dominant

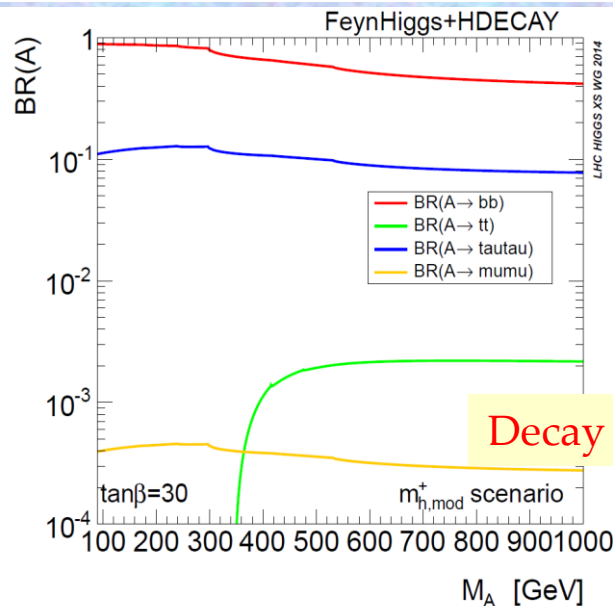

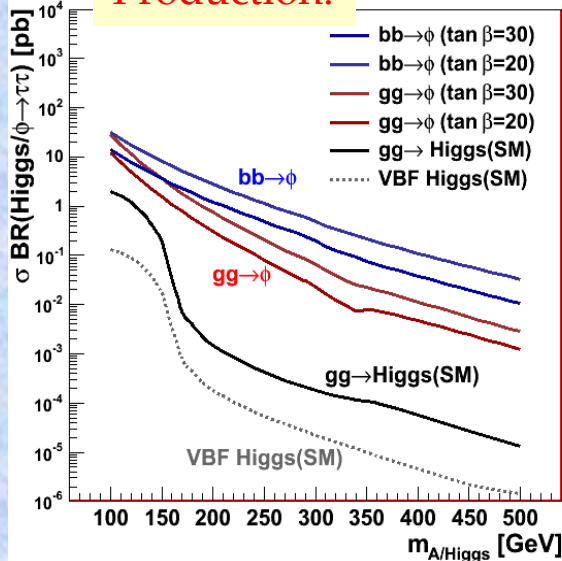

- small-moderate $\tan \beta$: gluon-fusion production is dominant

- high $\tan \beta$: b-associated production is enhanced

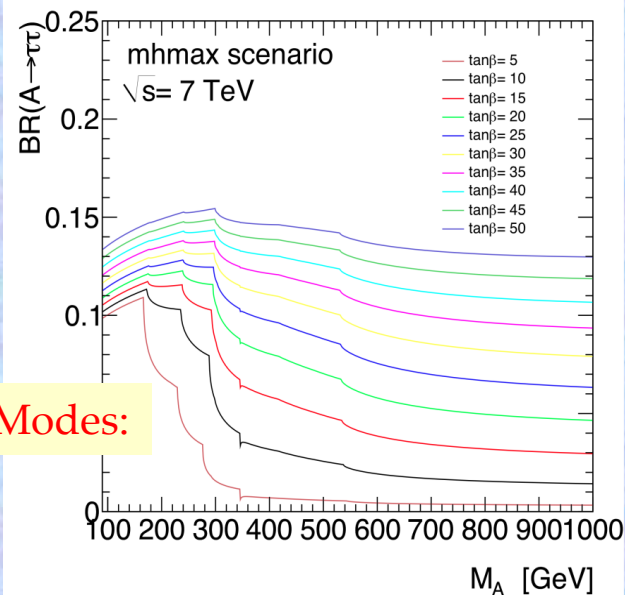

➤ Decay Modes: $b\bar{b}$ (90%), $\tau\tau$ (10%), $\mu\mu$ (0.04%)

Coll.	Channel	Dataset	Cite
CMS	$\tau\tau$	25fb-1(7+8TeV)	CMS-PAS-HIG-13-021
ATLAS	$\tau\tau/\mu\mu$	5fb-1(7TeV)	JHEP02(2013)095

D0+CDF	$b\bar{b}$	3-5fb-1(2TeV)	PRD 86, 091101 (2012)
CMS	$b\bar{b}$	3-5fb-1(7TeV)	PLB 722, 207 (2013)

Production:

Decay Modes:

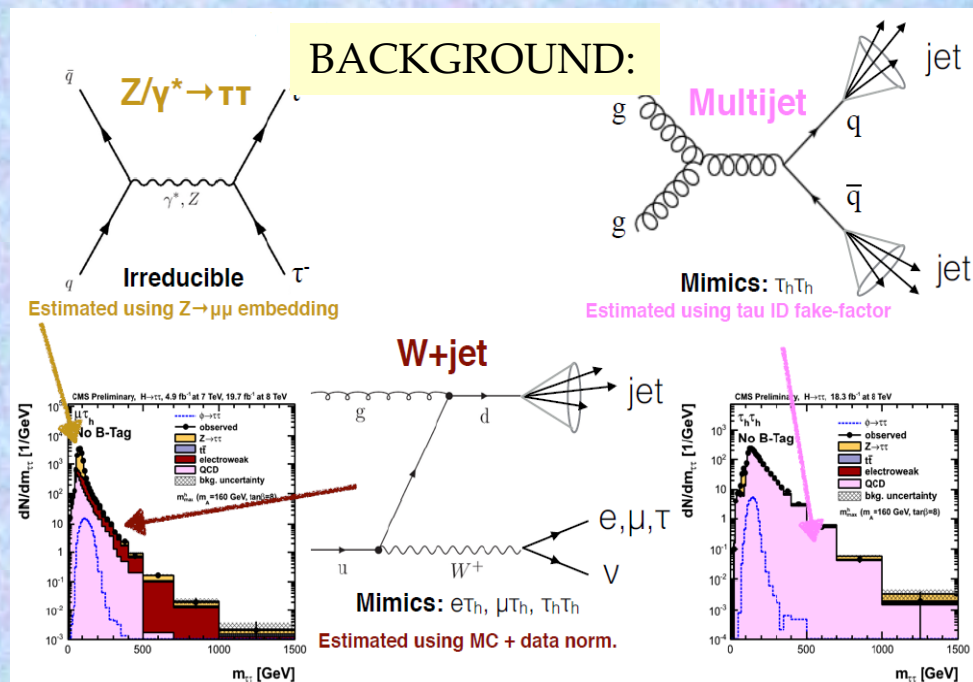

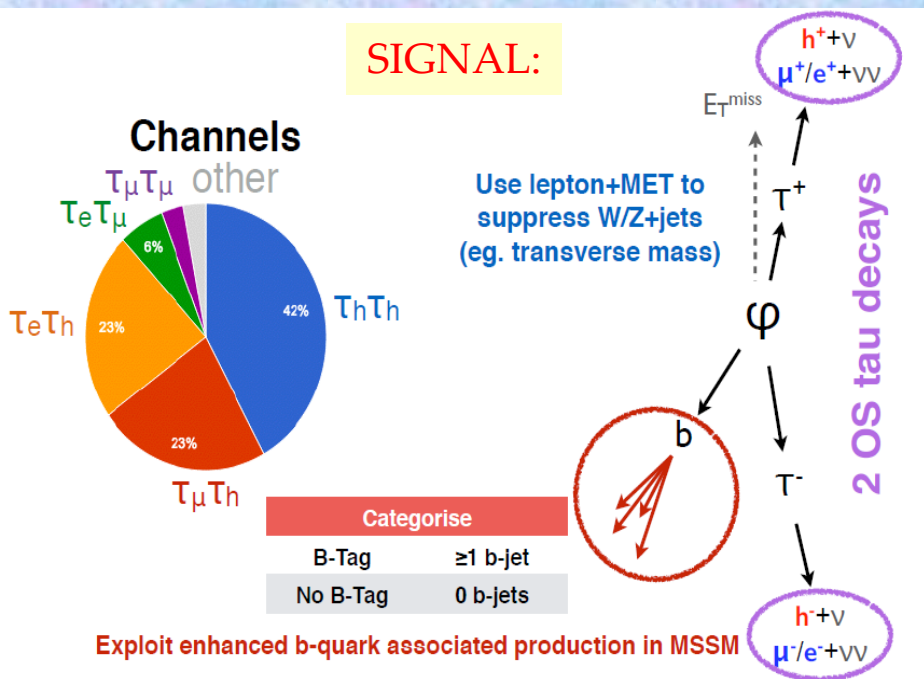

Neutral MSSM Higgs Boson $\phi(h, H, A)$ Searches

- ❖ Cover five of six possible $\tau\tau$ decay patterns: $\tau_\mu\tau_{had}, \tau_e\tau_{had}, \tau_{had}\tau_{had}, \tau_e\tau_\mu, \tau_\mu\tau_\mu$
- ❖ Split events into b-tag and no-b-tag categories

	ATLAS	CMS
Channels	$\tau_h\tau_h, e\tau_h, \mu\tau_h, e\mu$ (94%)	$\tau_h\tau_h, e\tau_h, \mu\tau_h, e\mu, \mu\mu$ (97%)
Categories	ll, lh: b-tag / b-veto lh high-mass: incl. hh: single-/di-tau trigger	all channels: b-tag / no b-tag
Discriminant	ll, lh: di-tau mass taking missing energy into account (MMC) hh: total transverse mass	all channels: di-tau mass taking missing energy into account (SVFit)

- **Dilepton:** sensitive at low mass where hadronic background is large
- **Semi-leptonic:** sensitive at wide range of masses
- **Hadronic:** sensitive at high mass: hadronic bkg. decreases

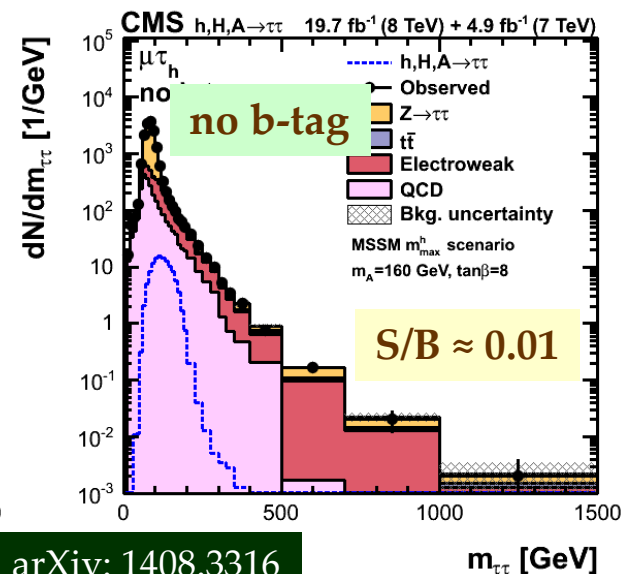

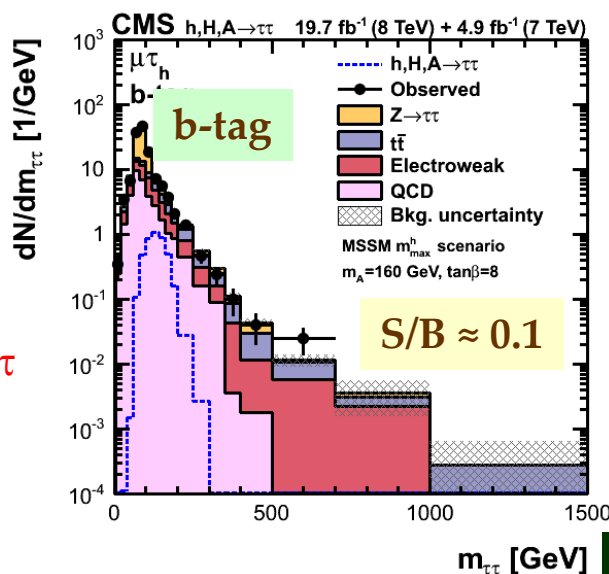

Neutral MSSM Higgs Boson $\phi(h,H,A) \rightarrow \tau\tau$ Search

- ❖ Di-tau mass reconstruction (SVFit) based on likelihood method using $e/\mu/\tau$ momenta and E_T^{miss} information

J. Phys. Conf. Ser. 513(2014)022035

- Analysis is similar to SM $H \rightarrow \tau\tau$ but optimized for different production mechanisms and Higgs boson masses

arXiv: 1408.3316

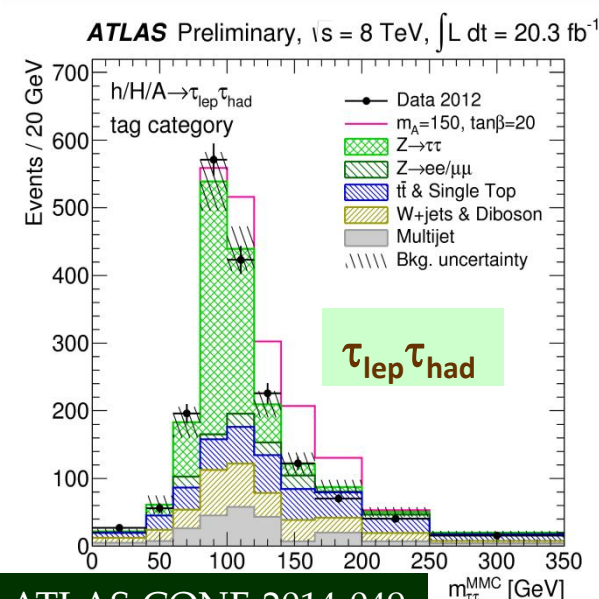

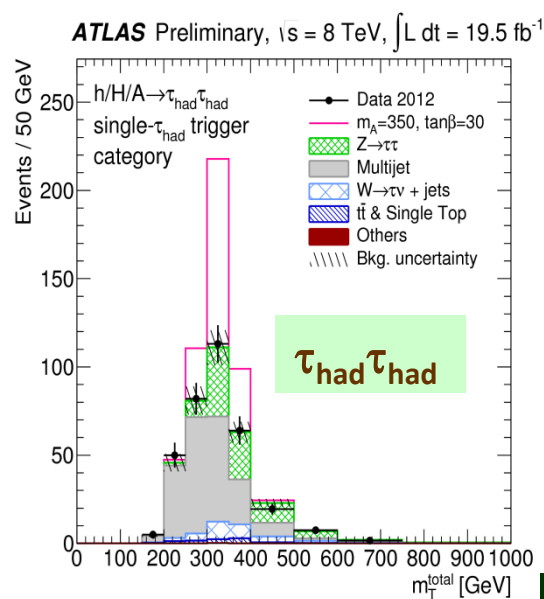

- ❖ Missing Mass Calculation (MMC) method based on lepton/tau momenta and E_T^{miss} information

NIMA654(2011) 481

- ❖ Separate optimizations in $\tau_{\text{lep}}\tau_{\text{had}}$ channel for the high- and low- mass

→ best sensitivity at high mass

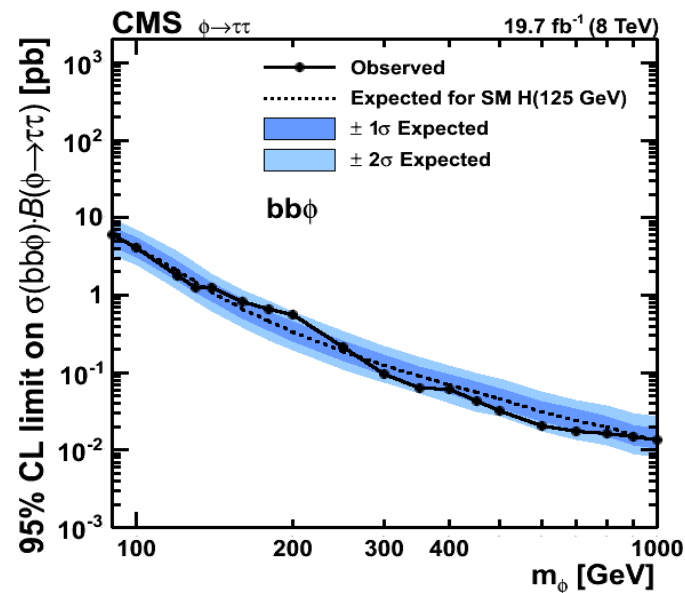

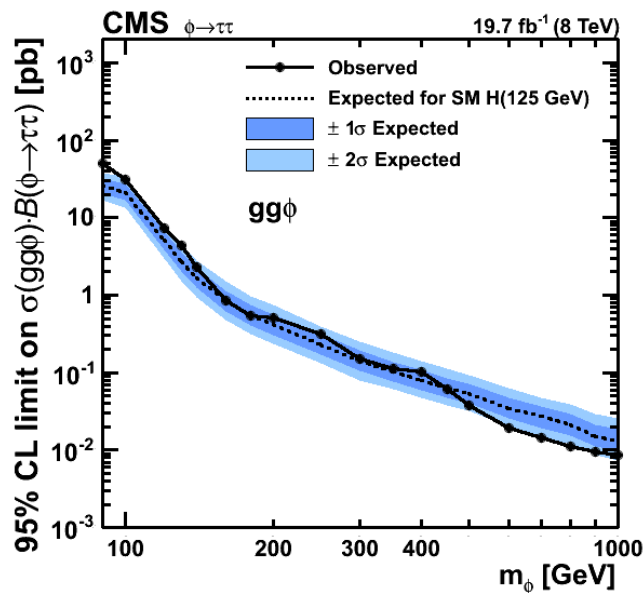

- $\tau_{\text{lep}}\tau_{\text{lep}}$ and $\tau_{\text{lep}}\tau_{\text{had}}$ channels combined for $m_A < 200$ GeV
- $\tau_{\text{lep}}\tau_{\text{had}}$ and $\tau_{\text{had}}\tau_{\text{had}}$ channels combined for $m_A \geq 200$ GeV

ATLAS-CONF-2014-049

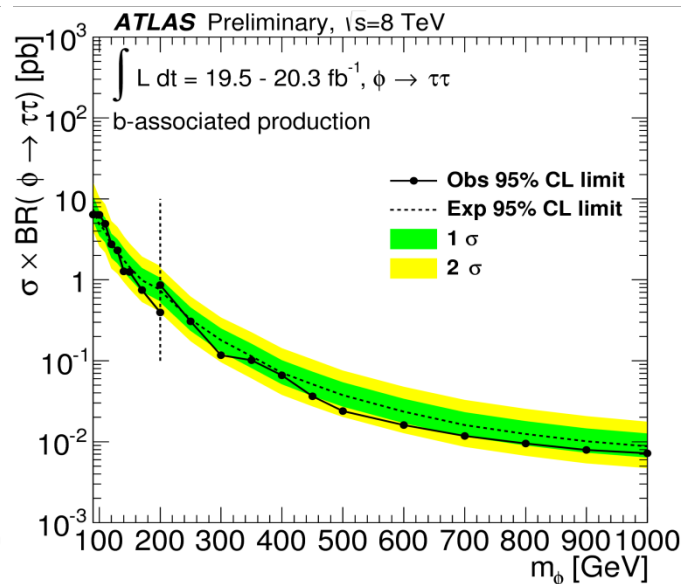

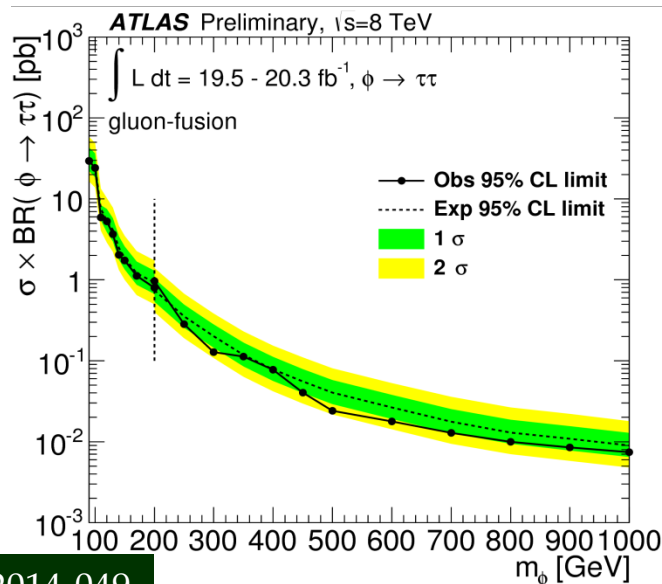

- No evidence of signal beyond the SM found
- Separate for gluon-fusion and b-associated production mechanisms
 - Calculate $\sigma \times \text{BR}$ limit on one process while the other is left floating freely

arXiv: 1408.3316

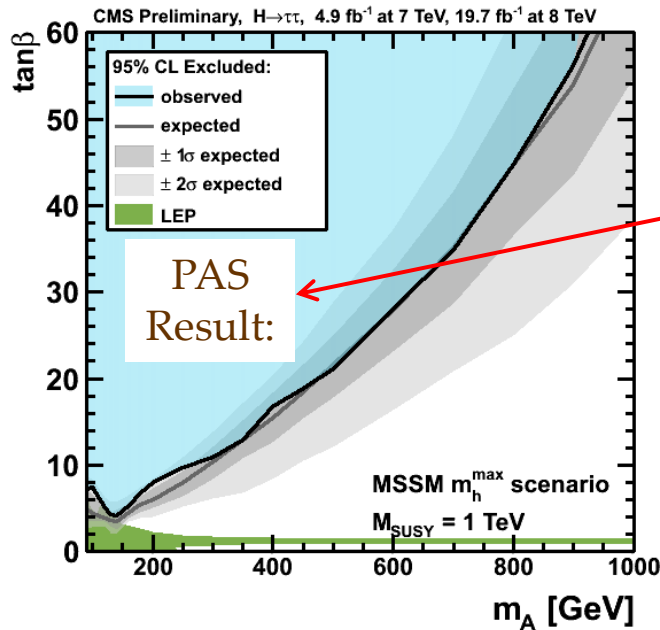

- Excluded $\sigma \times \text{BR}$ ranges from > 29 pb (> 6.4 pb) at $m_\phi = 90$ GeV to > 7.4 pb (> 7.2 pb) at $m_\phi = 1000$ GeV for ggF (b-associated) mechanisms

- Model-independent $\sigma \times \text{BR}$ limits achieve limits down to ~ 10 fb at high mass

$\phi(h, H, A) \rightarrow \tau\tau$: MSSM Interpretation

Model-Dependent Interpretation: Statistical Approaches

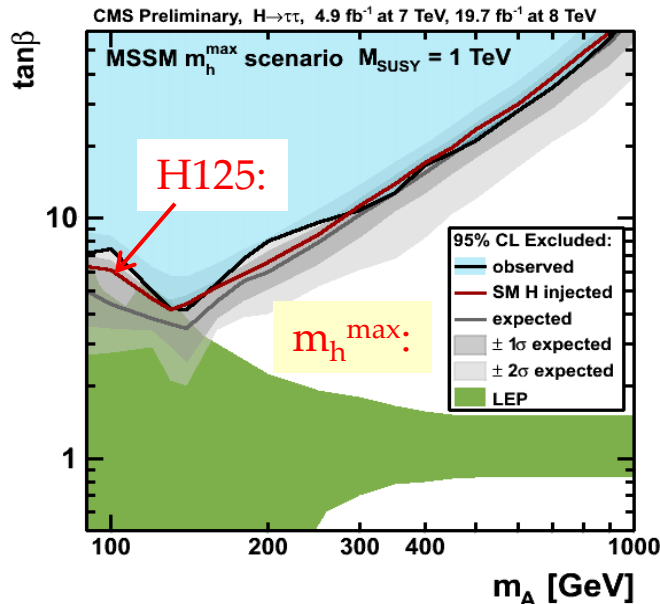

➤ Old Approach:

- Test MSSM vs background only (h+H+A+BG) vs (BG)
- New discovered particle was not taken into account

➤ New Approach:

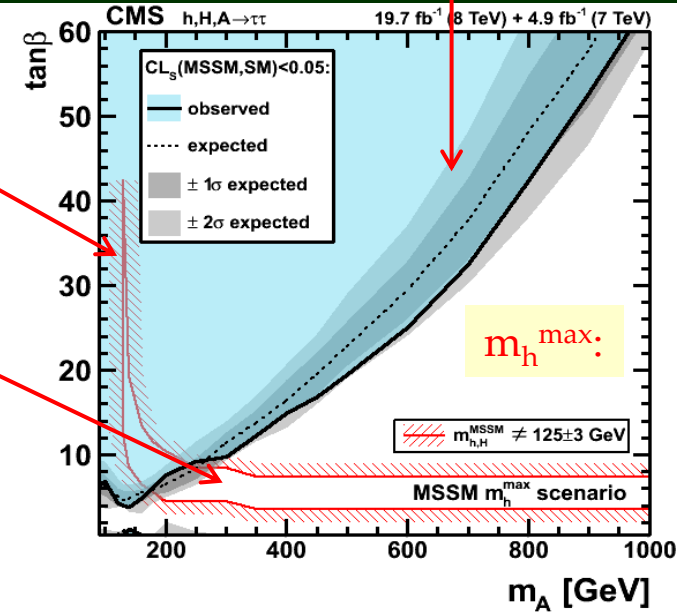

- Take into account the discovered Higgs boson at 125 GeV
- Hypothesis test of MSSM vs SM: (h+H+A+BG) vs (h_{SM}+BG)
- Presence of h(125) weakens the MSSM limits

<https://twiki.cern.ch/twiki/bin/viewauth/CMS/Hig13021PaperTwiki>

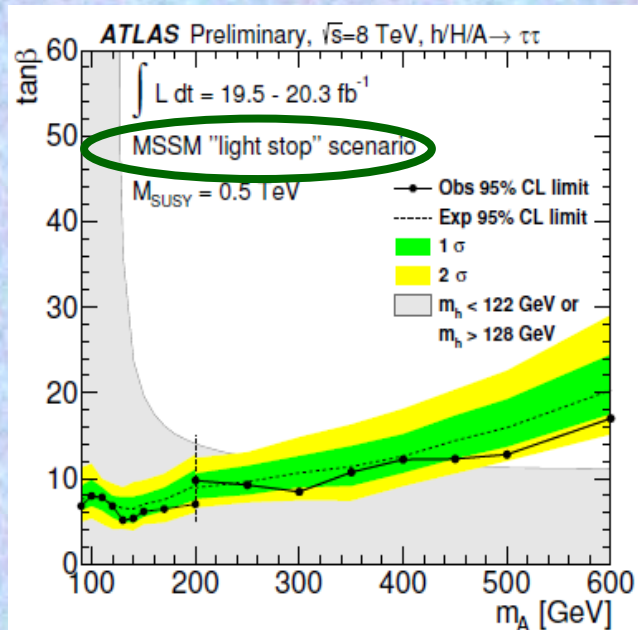

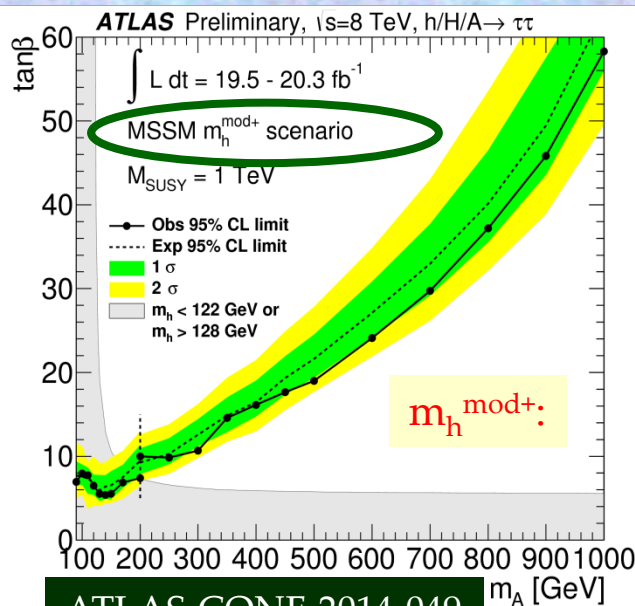

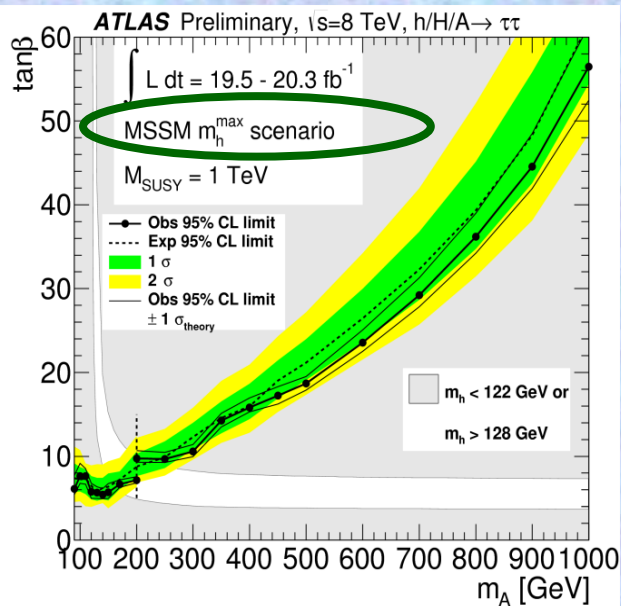

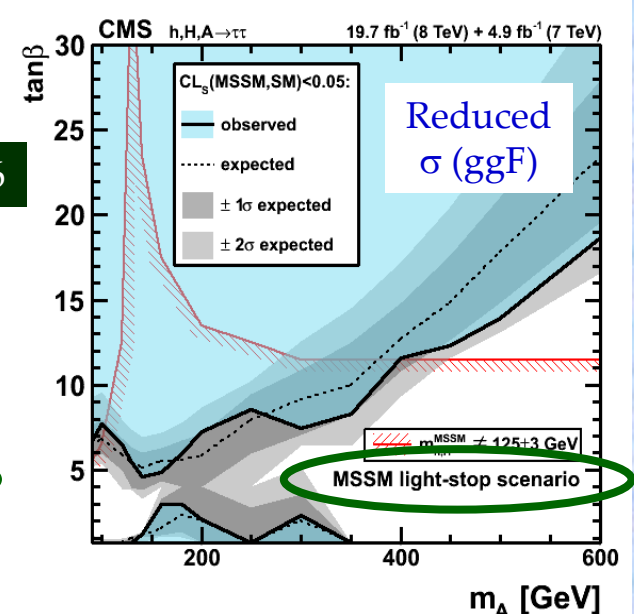

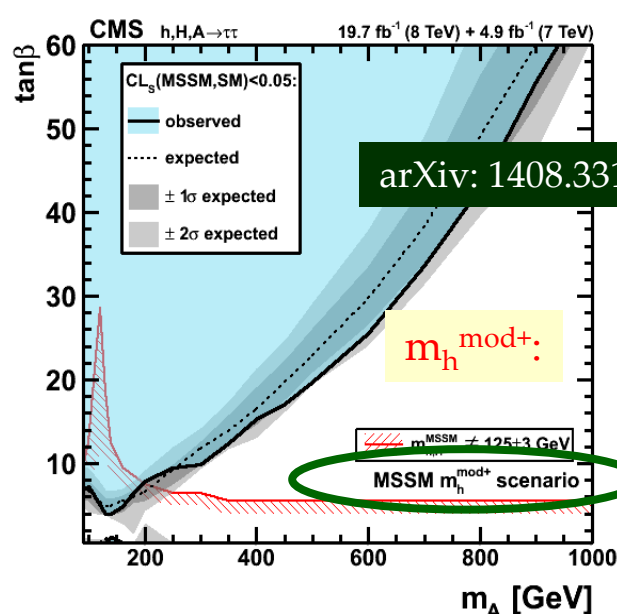

Incompatible with 125 + 3 GeV mass constraint

m_h^{\max} scenario is in agreement with the Higgs-like state only in a relatively small strip in the M_A - $\tan \beta$ plane at low $\tan \beta$

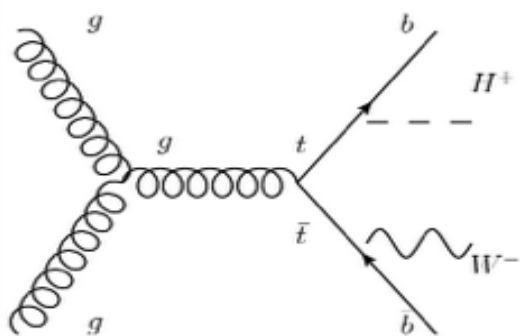

- Very low $\tan\beta$ upper limits ($\tan\beta < 5$ for $m_A < 250$ GeV \rightarrow touching the LEP constraint at low m_A)
- m_A - $\tan\beta$ exclusions in new benchmark scenarios (arXiv:1302.7033)
- m_h^{mod} scenario much better suited for mass of $h(125)$, than m_h^{max} scenario

Charged MSSM Higgs Boson Searches

Relation between m_{top} and M_{H^\pm} dictates both production mode and decay channels

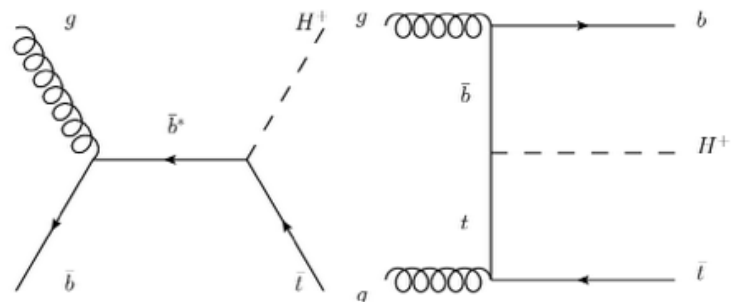

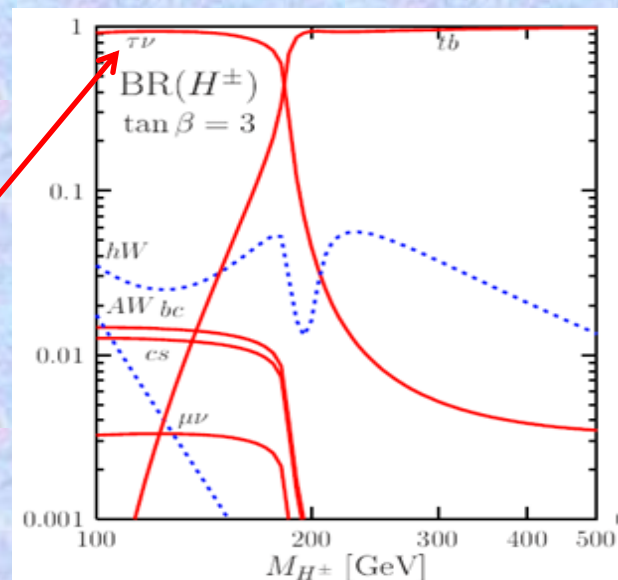

- Decay via $H^\pm \rightarrow \tau\nu$ / cs / tb , depending on $m(H^\pm)$ and $\tan\beta$
- τ / b / top reconstruction play a central role in the searches

Low mass H^\pm ($M_{H^\pm} < m_{\text{top}}$):
Final state: $H^\pm b W b$

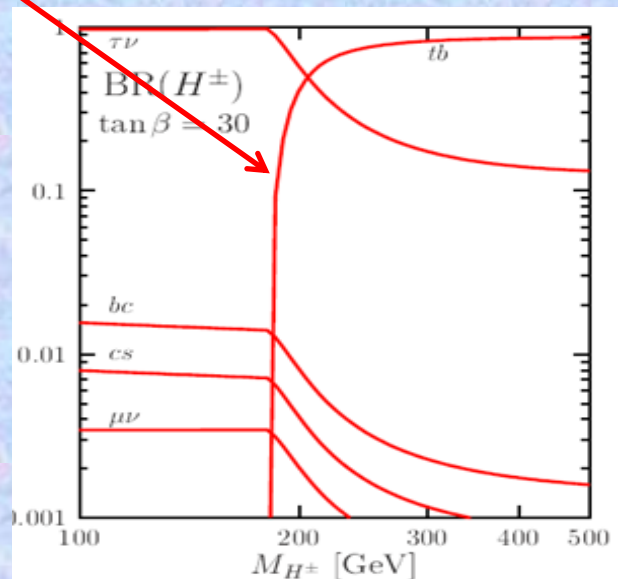

Dominant Decays:

- $\tan\beta > 3$: $B(H^\pm \rightarrow \tau\nu) \sim 90\%$
- $\tan\beta < 1$: $B(H^\pm \rightarrow cs) \sim 70\%$

Heavy ($M_{H^\pm} > m_{\text{top}}$):
Final state: tH^\pm

- $H^\pm \rightarrow tb$ dominant
- $H^\pm \rightarrow \tau\nu$ can be sizeable

Coll.	Channel	Dataset	Cite
ATLAS	$\tau\nu + \text{jets}$	20fb-1(8TeV)	ATLAS-CONF-2013-090
ATLAS	$\tau\nu + \text{lep}$	5fb-1(7TeV)	JHEP03(2013)076
ATLAS	cs	5fb-1(7TeV)	EPJC 73 6 (2013) 2465
CMS	$\tau\nu + \text{lep}/\text{jet}$	5fb-1(7TeV)	CMS-PAS-HIG-12-052
CDF	cs	2fb-1(2TeV)	PRL 103, 101803 (2009)
D0	tb	1fb-1(2TeV)	PRL 102, 191802 (2009)

Charged Higgs Boson Searches ($H^\pm \rightarrow cs$)

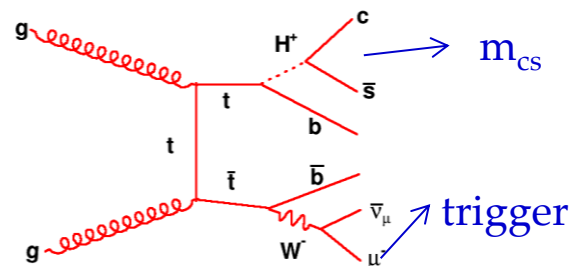

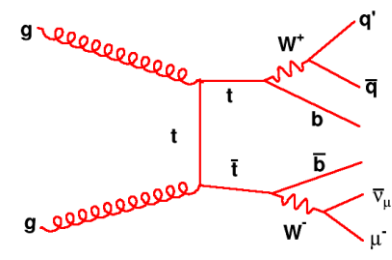

$H^\pm \rightarrow cs$ dominant decay mode for $\tan \beta < 1$ and $m(H^\pm) < m_{\text{top}}$

Same topology as $t\bar{t}$ decays in lepton + jets channel
 \rightarrow Search for second peak in di-jet mass distribution

SM $t\bar{t}$ semi-leptonic

H^\pm production in top decays

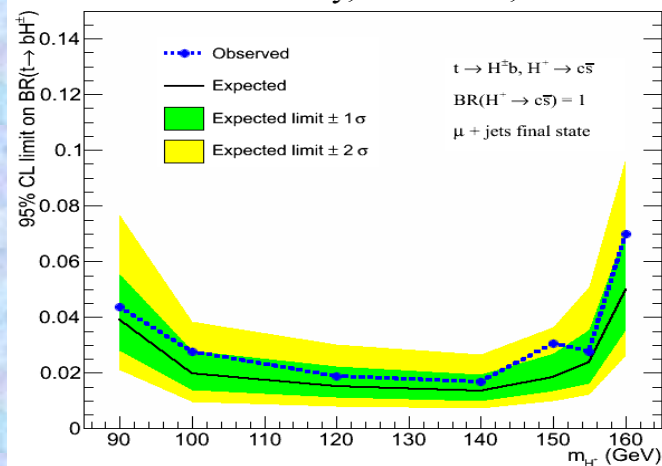

\rightarrow Kinematic fit of both top candidates
 $m=172.5$ GeV \rightarrow improves mass resolution of cs candidate (WH separation)

\rightarrow Bkgs.: $t\bar{t}$, W/Z+jets, di-bosons, QCD

\diamond M_{jj} (invariant mass of non-b-tagged jets) distribution after kinematic fit \rightarrow no signal

Light charged Higgs search $m_{H^\pm} < m_{\text{top}}$:
 Determine $\text{BR}(t \rightarrow bH^\pm)$ assuming $\text{BR}(H^\pm \rightarrow cs)=100\%$

CMS Preliminary, $\sqrt{s} = 8$ TeV, 19.7 fb^{-1}

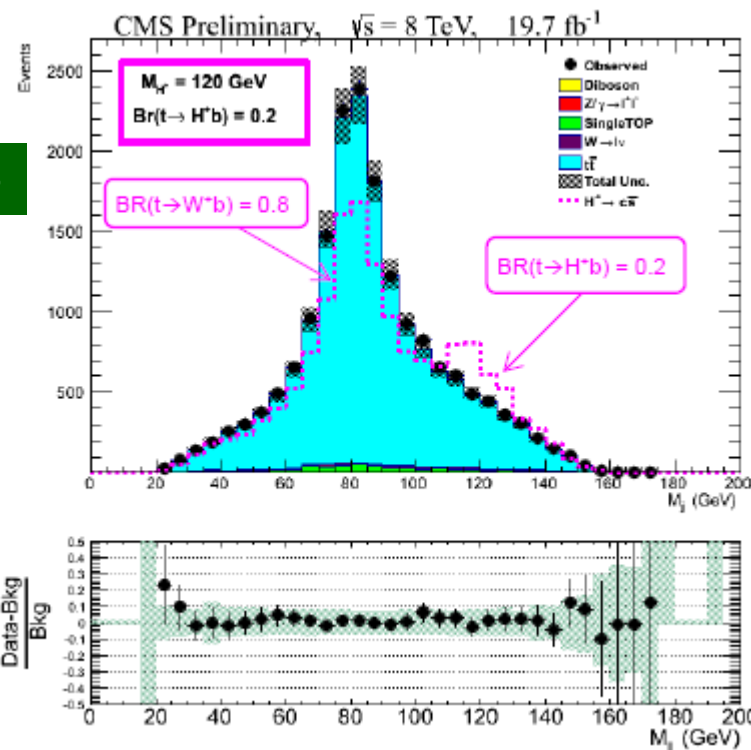

CMS-PAS-HIG-13-035

95% CL:

$\text{BR} < 1.7 - 7.0\%$
 Observed

$\text{BR} < 1.5 - 5.0\%$
 expected

Applies to any BSM resonance with the corresponding production & decay topology

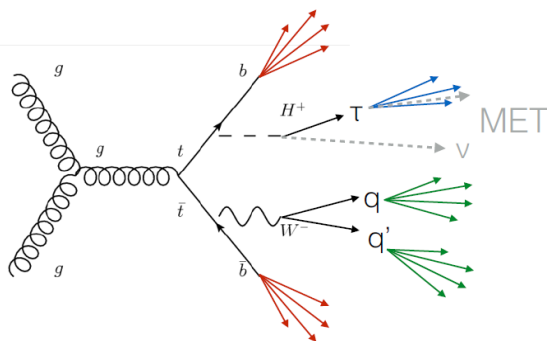

Charged Higgs Boson Searches ($H^\pm \rightarrow \tau\nu$)

$H^\pm \rightarrow \tau\nu + \text{jets}$ (light and heavy H^\pm)

- $1\tau, \geq 4$ jets (≥ 1 b-jet), no leptons, large MET;

Model-independent limits:

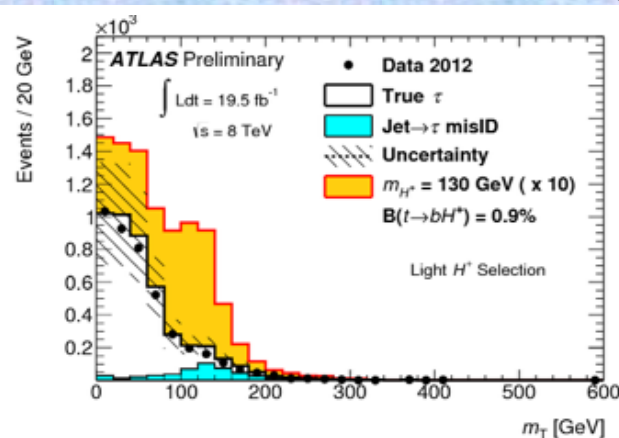

- **Light H^\pm :**
BR ($t \rightarrow H^\pm b$) = 0.24–2.1%
for $90 < m_{H^\pm} < 160$ GeV
- **Heavy H^\pm :**
 $\sigma(H^\pm) = 0.017\text{--}0.9$ pb
for $180 < m_{H^\pm} < 600$ GeV

Results interpreted in
MSSM m_h^{\max} scenario

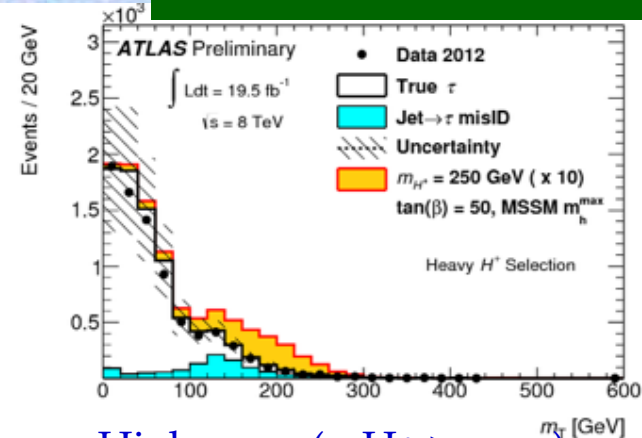

- ongoing searches:
heavy $H^\pm \rightarrow tb$

- ❖ Look for excess in τ -MET transverse mass distribution
- ❖ SM $t\bar{t}$ dominant background

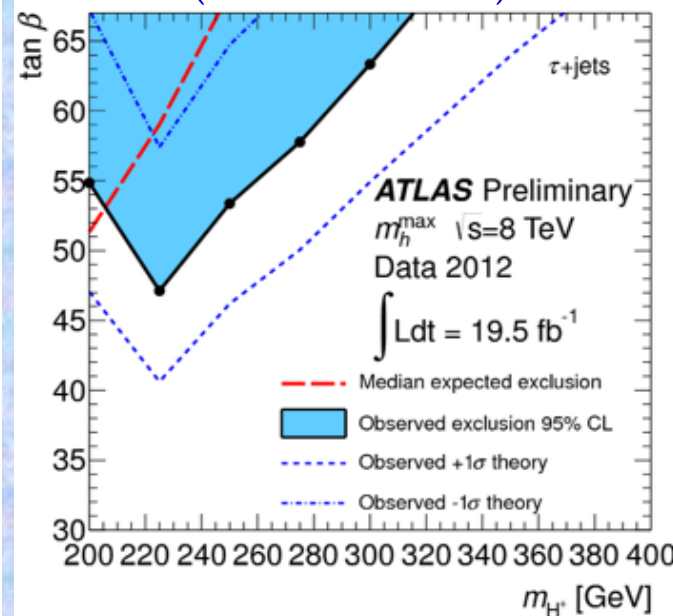

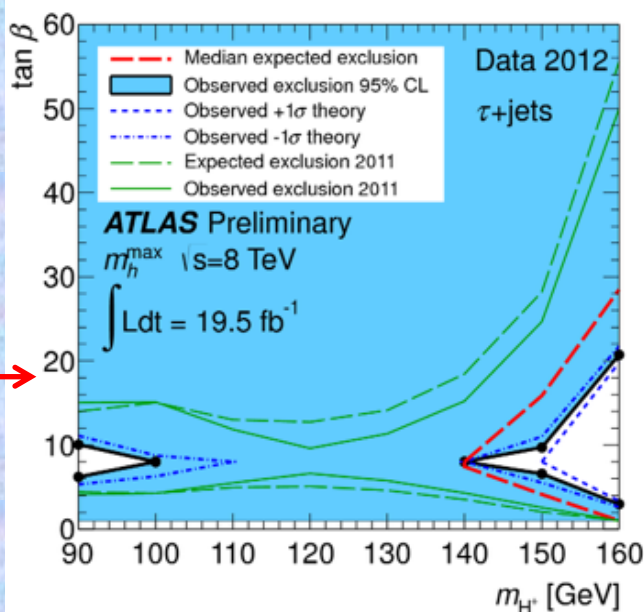

ATLAS-CONF-2013-090

Low mass ($m_{H^\pm} < m_{\text{top}}$)

High mass ($m_{H^\pm} > m_{\text{top}}$)
(looser selection)

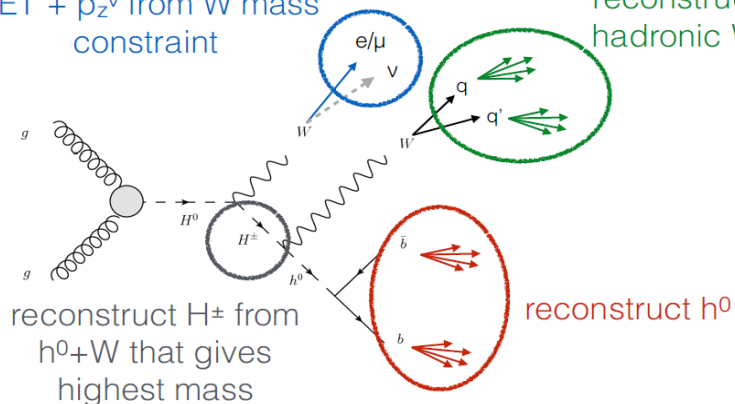

2HDM Higgs Cascade: Searches for Charged Higgs Boson

2 HDM phenomenology allow for cascade decays: $H \rightarrow W^\pm H^\mp \rightarrow W^\pm W^\mp h \rightarrow W^\pm W^\mp b\bar{b}$

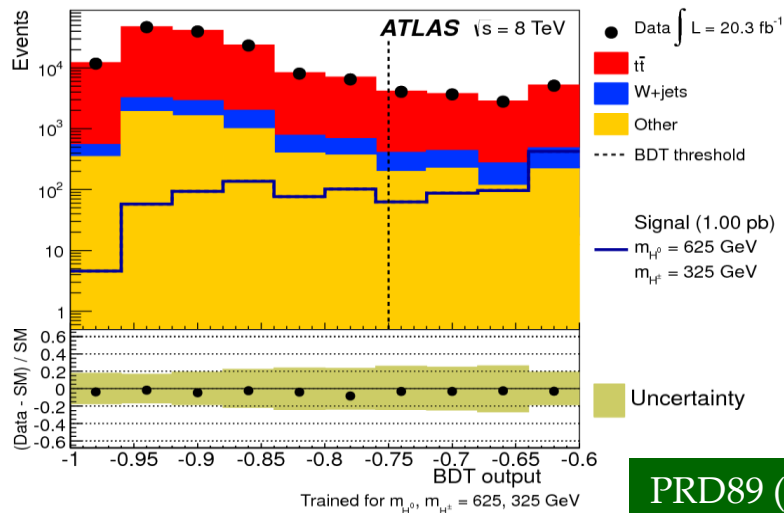

reconstruct leptonic W,
MET + p_z^ν from W mass
constraint

reconstruct
hadronic W

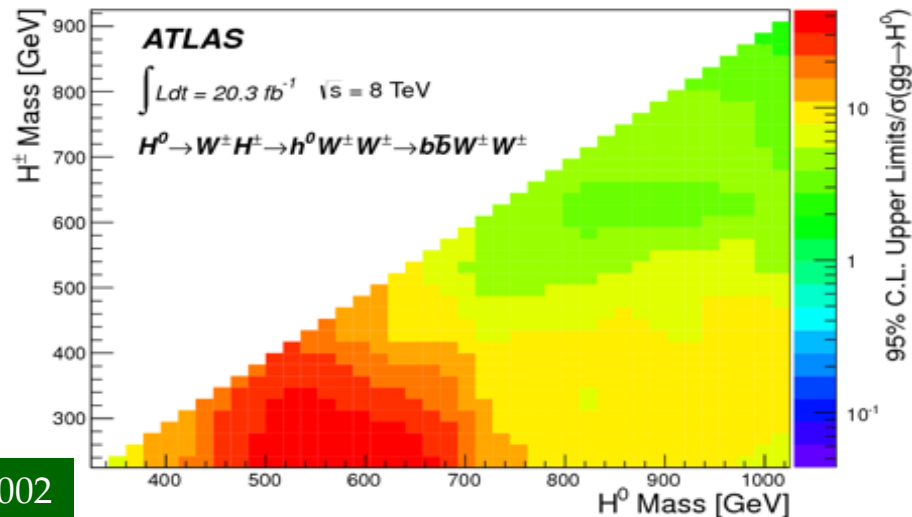

- No particular model assumed
- CP-odd (A) too heavy to participate in decay chain
- Only consider gluon fusion production
- h_0 (125 GeV) is the SM Higgs Boson
→ exploit $h \rightarrow b\bar{b}$ decay to gain statistics
- Drawback: same final state as $t\bar{t}$ semileptonic ($l + \text{jets}$) → use MVA to discriminate against bkg.
- Produce limits in the (m_H, m_{H^\pm}) plane

BDT output trained at 36 (m_{H^0}, m_{H^\pm}) mass points → kinematic difference between Higgs cascade and top-pair production

- Upper limits : larger than theoretical (SM-like) H^0 Cross-section
- Approaching SM pred. in high-mass region

2 HDM Higgs Cascade: Searches for $H \rightarrow hh$ and $A \rightarrow Zh$

h (126) is the SM-like Higgs boson:

- $H \rightarrow hh$ dominant in $2m_h < m_H < 2m_{\text{top}}$
- $A \rightarrow Zh$ dominant in $m_h + m_z < m_H < 2m_{\text{top}}$

Exclusive search in various final states:

- **Multileptons:** ≥ 3 leptons; 0 or 1 τ_{had}
- **Diphotons:** = 2 photons; at least one lepton

Leptons	Photons	OSSF pairs	Hadronic τ	b-tag
4	0	0, 1 or 2	0 or 1	0 or 1
3	0	0 or 1	0 or 1	0 or 1
2	2	0 or 1	0	-
1	2	-	0	-
1	2	-	1	-
0	2	-	1 or 2	-

$H \rightarrow hh$:

CMS-PAS-HIG-13-025

	$h \rightarrow WW^*$	$h \rightarrow ZZ^*$	$h \rightarrow \tau\tau$	$h \rightarrow bb$	$h \rightarrow \gamma\gamma$
$h \rightarrow WW^*$	✓	✓	✓	X	✓
$h \rightarrow ZZ^*$	-	✓	✓	✓	✓
$h \rightarrow \tau\tau$	-	-	✓	X	✓
$h \rightarrow bb$	-	-	-	X	X
$h \rightarrow \gamma\gamma$	-	-	-	-	X

$H \rightarrow Zh$:

	$h \rightarrow WW^*$	$h \rightarrow ZZ^*$	$h \rightarrow \tau\tau$	$h \rightarrow \gamma\gamma$
$Z \rightarrow ll$	✓	✓	✓	✓
$Z \rightarrow qq$	X	✓	X	X
$Z \rightarrow \nu\nu$	X	✓	X	X

- Use SuShi + 2HDMC to calculate cross sections and BRs from theory

- Translate limits on $\sigma \cdot \text{BR}$ in limits on α and β (determine cross-section and BRs for H and A production/decays)

- $\cos(\beta - \alpha) = 0$: Decoupling limit: h behaves like in SM

Direct Constraints: on 2 HDM (Type I and Type II) Models

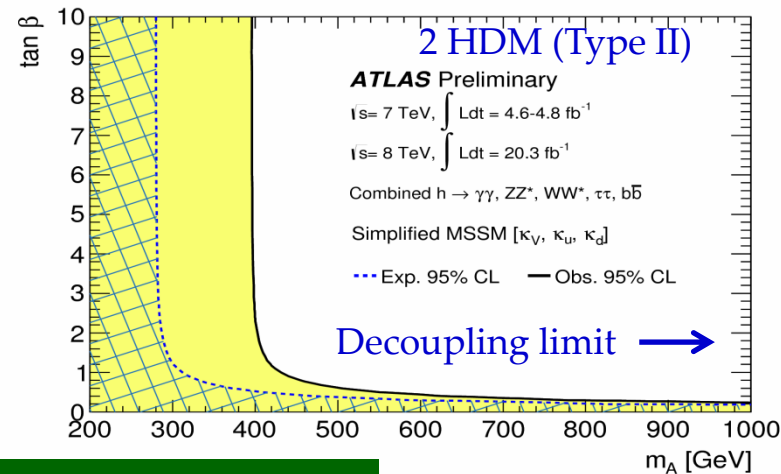

Reinterpretation of $h(126)$ Couplings in 2 HDM Model

- Parameterize difference in Higgs couplings w.r.t. SM (production/decay rates in $\gamma\gamma, ZZ, WW, \tau\tau, b\bar{b}$ interpret in each type of **2HDM**)
- Assume Higgs decay kinematics not significantly altered and **$h(126)$ - light CP-even neutral Higgs**
- Rescaling rates according to k_i for the SM production modes ($b\bar{b}H$ included as correction scaling with the square of b-quark coupling)
- Extracting from k_i information on $\tan\beta$ and $\cos(\beta-\alpha)$

Coupling scale factors for light CP-even Higgs can be written as function of m_A & $\tan\beta$

ATLAS-CONF-2014-010

Type I

Fermiophobic

ATLAS Preliminary
 $\sqrt{s} = 7 \text{ TeV}, \int \mathcal{L} dt = 4.6-4.8 \text{ fb}^{-1}$
 $\sqrt{s} = 8 \text{ TeV}, \int \mathcal{L} dt = 20.3 \text{ fb}^{-1}$
 Combined $h \rightarrow \gamma\gamma, ZZ^*, WW^*$
 $h \rightarrow \tau\tau, b\bar{b}$

Type II

MSSM-like

ATLAS Preliminary
 $\sqrt{s} = 7 \text{ TeV}, \int \mathcal{L} dt = 4.6-4.8 \text{ fb}^{-1}$
 $\sqrt{s} = 8 \text{ TeV}, \int \mathcal{L} dt = 20.3 \text{ fb}^{-1}$
 Combined $h \rightarrow \gamma\gamma, ZZ^*, WW^*$
 $h \rightarrow \tau\tau, b\bar{b}$

Type III

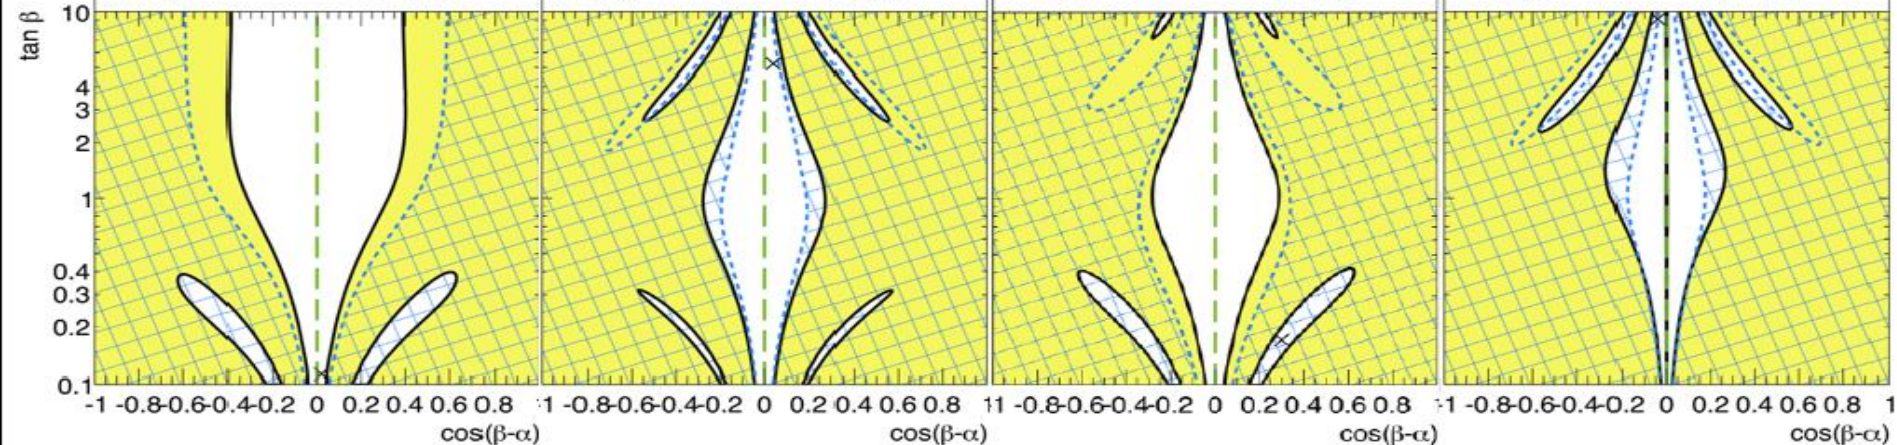

Lepton-specific

ATLAS Preliminary
 $\sqrt{s} = 7 \text{ TeV}, \int \mathcal{L} dt = 4.6-4.8 \text{ fb}^{-1}$
 $\sqrt{s} = 8 \text{ TeV}, \int \mathcal{L} dt = 20.3 \text{ fb}^{-1}$
 Combined $h \rightarrow \gamma\gamma, ZZ^*, WW^*$
 $h \rightarrow \tau\tau, b\bar{b}$

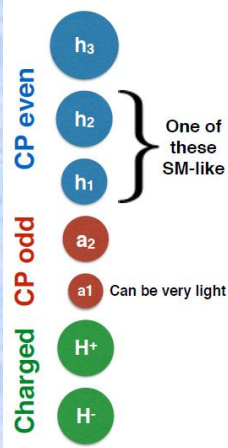

Type IV

Flipped

ATLAS Preliminary
 $\sqrt{s} = 7 \text{ TeV}, \int \mathcal{L} dt = 4.6-4.8 \text{ fb}^{-1}$
 $\sqrt{s} = 8 \text{ TeV}, \int \mathcal{L} dt = 20.3 \text{ fb}^{-1}$
 Combined $h \rightarrow \gamma\gamma, ZZ^*, WW^*$
 $h \rightarrow \tau\tau, b\bar{b}$

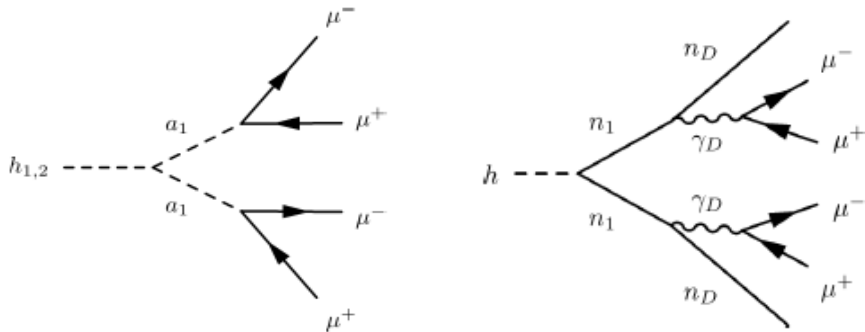

Higgs Sector in NMSSM

NMSSM: additional gauge singlet w. r. t. MSSM \rightarrow further extend Higgs sector: 1 additional CP-even and 1 additional CP-odd wrt MSSM

Larger phenomenology: additional particles can be very light (neutral scalars with $m_h < 125$ not excluded in NMSSM)

Motivated by two model interpretations:

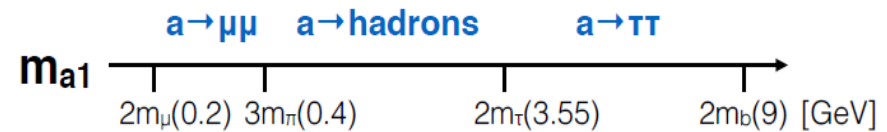

❖ NMSSM:

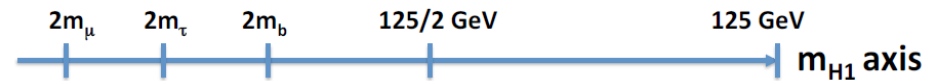

- $h_{1,2}$ (SM-like Higgs) decays to 2 a_1 (CP-odd)
- $\text{BR}(a_1 \rightarrow \mu\mu)$ sizeable, if $2m_\mu < m_{a1} < 2m_\tau$

❖ Dark SUSY:

- $h \rightarrow 2n_1 \rightarrow 2n_D 2\gamma_D \rightarrow 2n_D 4\mu$
- n_1 - lightest neutralino, n_D - dark neutralino, γ_D - dark photon
- $\text{BR}(\gamma_D \rightarrow \mu\mu)$ up to 45% depending on γ_D mass

Coll.	Channel	m_a range [GeV]	Dataset	Cite
CMS	$h \rightarrow 2a \rightarrow 4\mu$	0.25 - 3.55	21fb-1(8TeV)	CMS-PAS-HIG-13-010
D0	$h \rightarrow 2a \rightarrow 4\mu/2\mu 2\tau$	0.2 - 20	4fb-1(2TeV)	PRL 103, 061801 (2009)
ATLAS	$h \rightarrow 2a \rightarrow 4\gamma$	0.1 - 0.4	5fb-1(7TeV)	ATLAS-CONF-2012-079
CMS	$a \rightarrow 2\mu$	5.5 - 14	1fb-1(7TeV)	PRL 109, 121801 (2012)
CDF	$t \rightarrow H + b \rightarrow W a (\rightarrow \tau\tau) b$	4 - 9	3fb-1(2TeV)	CDF Note 10104

- $2m_\mu < m_{h1} < 2m_\tau$: $h_1 \rightarrow a_1 a_1 \rightarrow 4\mu + X$
- $2m_\tau < m_{h1} < 2m_b$: $h_2 \rightarrow h_1 h_1 \rightarrow 4\tau + X$
- $2m_b < m_{h1} < 125/2$ GeV: $h_2 \rightarrow h_1 h_1 \rightarrow \tau\tau b\bar{b} + X$
 $Wh_2 \rightarrow h_1 h_1 \rightarrow b\bar{b}b\bar{b}$
- $125/2$ GeV $< m_{h1} < 125$ GeV :
 $h_3 \rightarrow h_2 h_1 \rightarrow WWb\bar{b}$

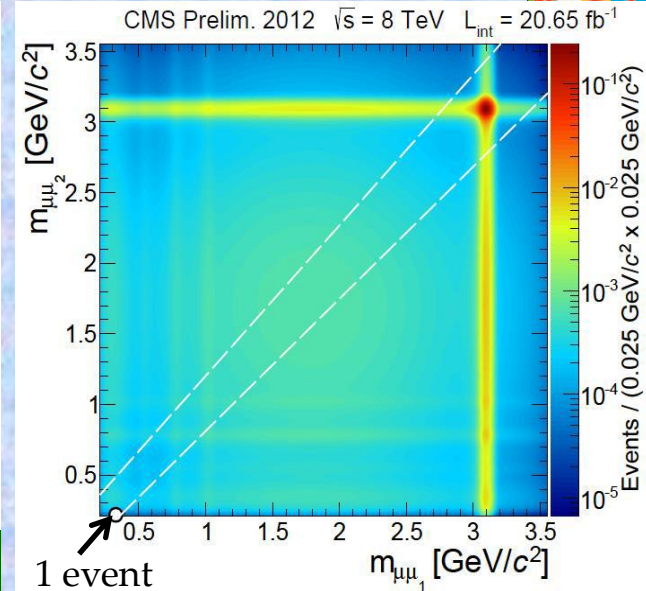

Neutral NSSM Higgs Boson Searches: $h \rightarrow 2a + X \rightarrow 4\mu + X$

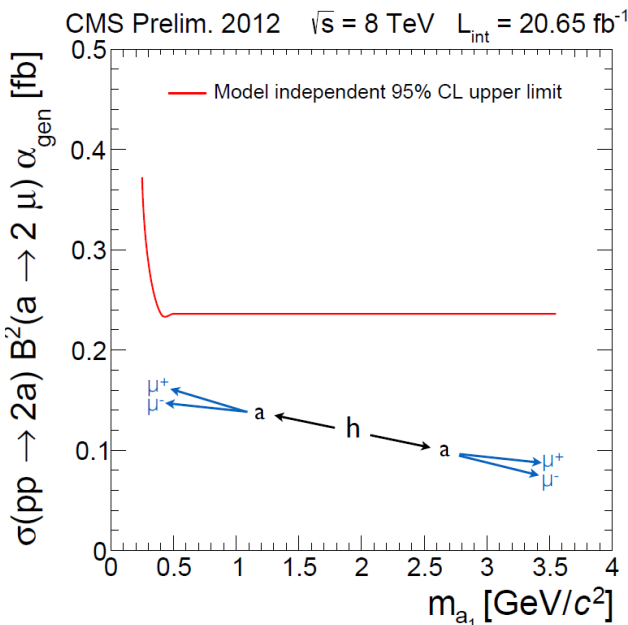

➤ Search for pair production of a new light boson from the decay of a SM-like Higgs boson:

- **NMSSM:** substantial BR $a \rightarrow \mu\mu$ if $2m_\mu < m_a < 2m_\tau$
 $h \rightarrow 4\mu + X$ final state is explored
- Background dominated by bb and J/ψ pair production
- 1 event observed in signal region, compatible with bkg. prediction 3.8 ± 2.1
- Limit obtained for $0.25 < m_a < 3.55$ GeV, $m_h > 86$ GeV
- Search interpreted for NMSSM, dark-SUSY models as well as model-independent

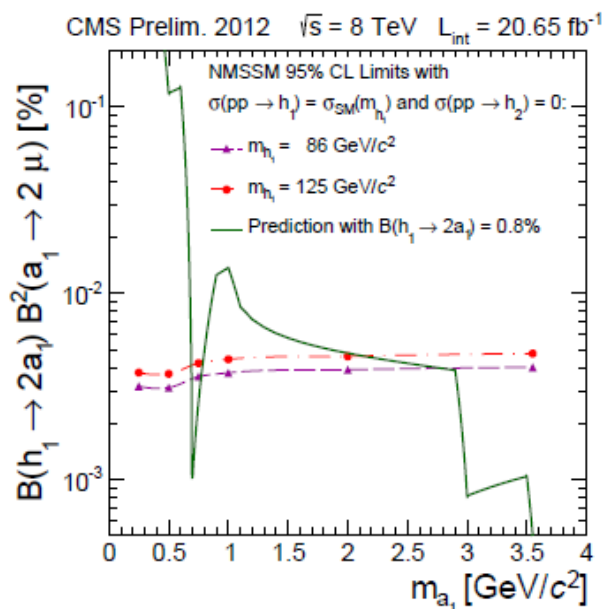

CMS-PAS-HIG-13-010

*Results discussed in the talk (marked in magenta)

- Searches for particles with long lived signatures at colliders → see talk Rachel Christine Rosten
- Comparison of collider and non-collider DM results → see talk Phat Srimanobhas

Rare Higgs decays as probes of **new couplings** and **SM extensions** (may enhance SM branching ratios)

Decay mode	Limit (σ/σ_{SM})@125 GeV	
	CMS	ATLAS
$h \rightarrow \gamma^* \gamma \rightarrow \mu\mu\gamma$	< 10	-
$h \rightarrow Z\gamma$	< 10	< 11
$h \rightarrow \mu\mu$	< 7.4	< 7.2

❖ $H \rightarrow \mu\mu$

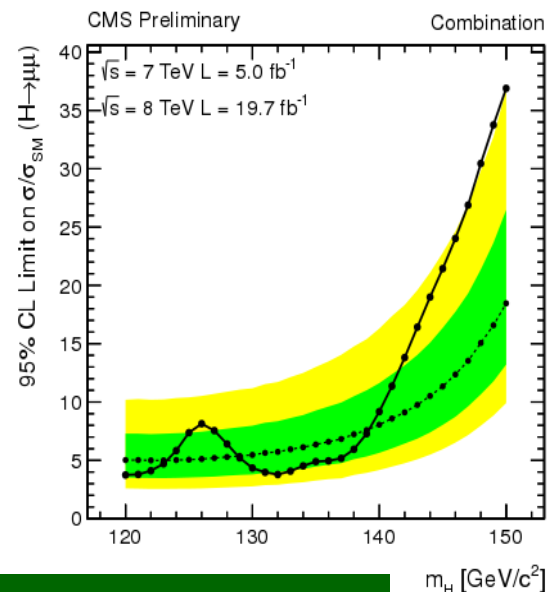

- SM BR @125 GeV $\simeq 2 \times 10^{-4}$
- probes directly 2nd generation Higgs fermion coupling

❖ $H \rightarrow Z\gamma/\gamma^*\gamma$

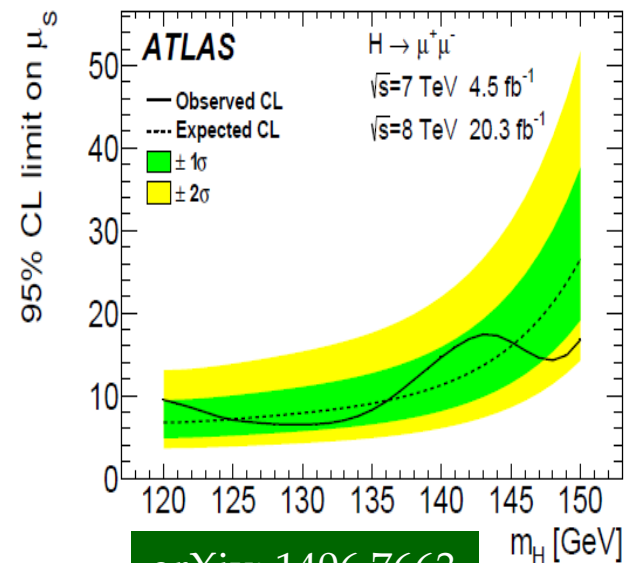

- SM BR @125 GeV $\simeq 1 \times 10^{-4}$ ($Z \rightarrow ee, \mu\mu$)
- constrains new particle contributions in loops

$\phi(h, H, A) \rightarrow \mu\mu$ Final State:

- Clean signature - $\mu\mu$ resonance
- Main backgrounds: Z/γ^* , tt , WW
- Categorization of events
 - mass resolution
 - production ggF/VBF mechanism
- $\tan \beta$ can be extracted from the signal mass $M_{A0} = M_{\mu+\mu-}$ and its width ($\Gamma_{\mu+\mu-}$)

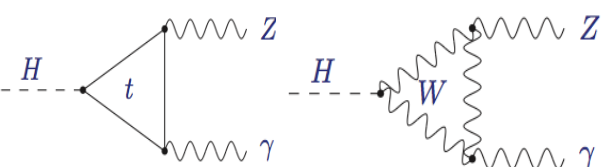

CMS-PAS-HIG-13-007

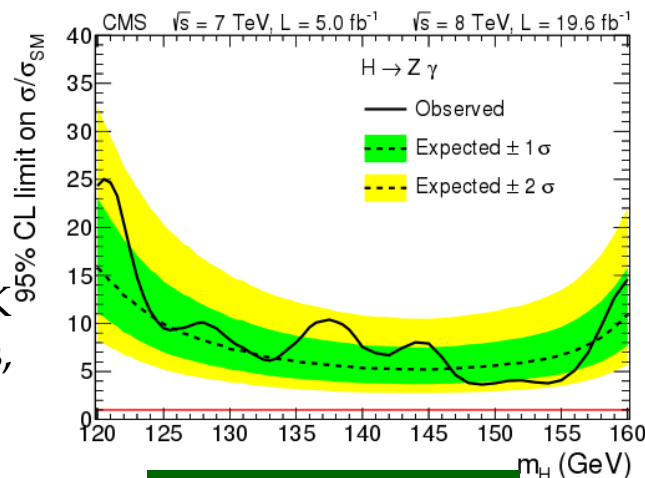

arXiv: 1406.7663

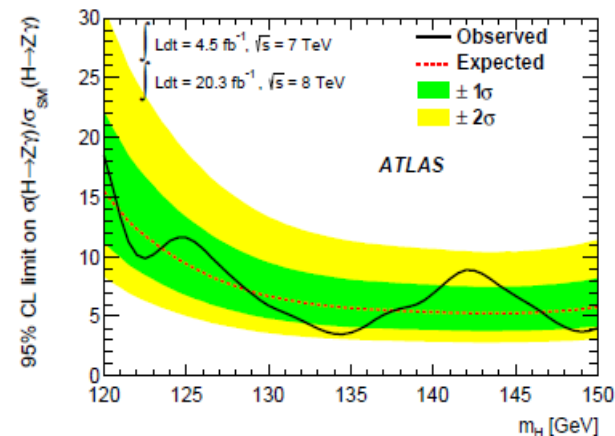

❖ $h \rightarrow Z\gamma$ Final State: sensitive to BSM contributions in loops \rightarrow e.g. composite Higgs

- $\mu\mu\gamma$ and $e e \gamma$ final states
- Main backgrounds: $Z\gamma$ EWK production, FSR in $Z \rightarrow l l$ decays, jets (mis)identified as photon in Z +jets events
- $m(l l \gamma)$ use to extract limits

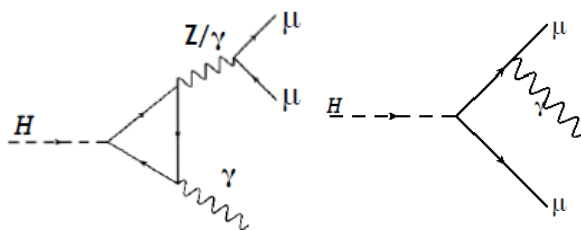

PLB726(2013) 587

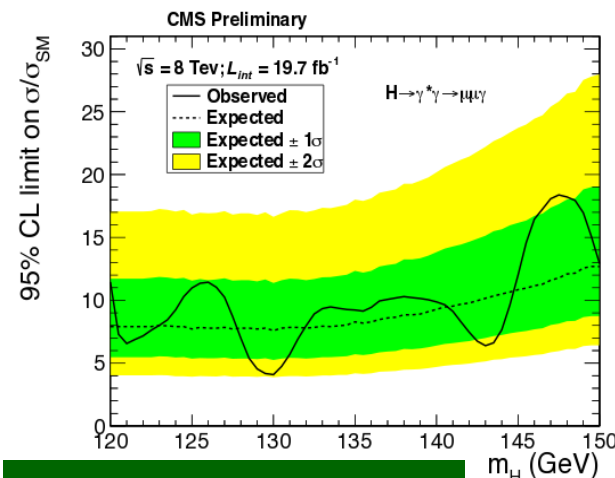

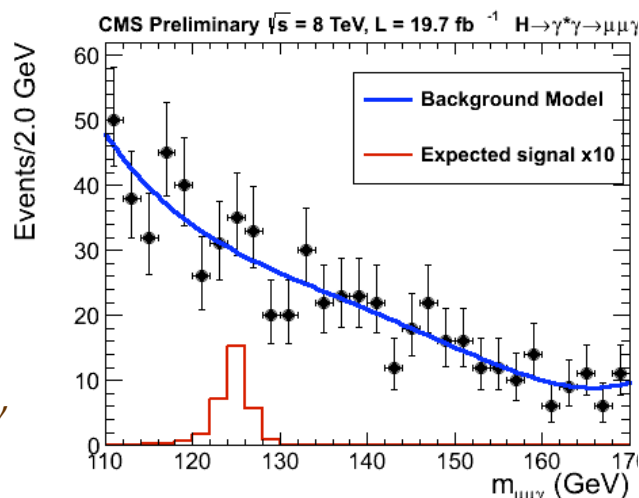

PLB732(2014) 8

❖ $h \rightarrow \gamma^* \gamma \rightarrow \mu\mu\gamma$ Final State: Sensitive to BSM loop/tree level processes \rightarrow e.g. new resonances

- “Dalitz decay”: internal conversion of γ^* into $\mu\mu$
- $m_{\mu\mu} < 20$ GeV to separate $\gamma^* \gamma$ from $Z\gamma$
- Similar sensitivity as in $H \rightarrow Z(\rightarrow \mu\mu)\gamma$

CMS-PAS-HIG-14-003

2 HDM Higgs and FCNC

Coll.	Dataset	Cite
ATLAS	25fb-1(7+8TeV)	arXiv:1403.6293 [hep-ex]
CMS	20fb-1(8TeV)	CMS-PAS-HIG-13-034

➤ FCNC highly suppressed in SM due to GIM mechanism → can be relaxed in BSM

❖ LHC: Large $t\bar{t}$ cross section and large top coupling to Higgs: for $t \rightarrow cH$ possible new physics rate higher than SM by $\sim 10^{10}-10^{12}$

Process	SM	QS	2HDM-III	FC-2HDM	MSSM
$t \rightarrow u\gamma$	$3.7 \cdot 10^{-16}$	$7.5 \cdot 10^{-9}$	—	—	$2 \cdot 10^{-6}$
$t \rightarrow uZ$	$8 \cdot 10^{-17}$	$1.1 \cdot 10^{-4}$	—	—	$2 \cdot 10^{-6}$
$t \rightarrow uH$	$2 \cdot 10^{-17}$	$4.1 \cdot 10^{-5}$	$5.5 \cdot 10^{-6}$	—	10^{-5}
$t \rightarrow c\gamma$	$4.6 \cdot 10^{-14}$	$7.5 \cdot 10^{-9}$	$\sim 10^{-6}$	$\sim 10^{-9}$	$2 \cdot 10^{-6}$
$t \rightarrow cZ$	$1 \cdot 10^{-14}$	$1.1 \cdot 10^{-4}$	$\sim 10^{-7}$	$\sim 10^{-10}$	$2 \cdot 10^{-6}$
$t \rightarrow cH$	$3 \cdot 10^{-15}$	$4.1 \cdot 10^{-5}$	$1.5 \cdot 10^{-3}$	$\sim 10^{-5}$	10^{-5}

FCNC: $t \rightarrow cH$ Decays

CMS-PAS-HIG-13-034

Searches done using $t\bar{t}b\bar{a}$ topology:

➤ Reinterpretation of searches:

❖ **Diphoton:** CMS-PAS-HIG-13-025 ($H \rightarrow hh, A \rightarrow Zh$)

❖ **Multilepton:** CMS-PAS-SUS-13-002

$$B(t \rightarrow Hc) < 0.56\% \text{ (0.65\%)} \leftarrow$$

Used to place limit on coupling

$$g_{tHc} < 0.14 \text{ (observed)}$$

Combine most sensitive categories for stat. interpretation:

- **Multileptons:** 3 leptons (no hadronic tau), no opposite-sign same-flavour pair (OSSF) or an OSSF and a b-tag
- Sensitivity improved by **diphoton channel b-tag**

Higgs Decay Mode	observed	expected	1σ range
$H \rightarrow WW^*$ ($B = 23.1\%$)	1.58 %	1.57 %	(1.02–2.22) %
$H \rightarrow \tau\tau$ ($B = 6.15\%$)	7.01 %	4.99 %	(3.53–7.74) %
$H \rightarrow ZZ^*$ ($B = 2.89\%$)	5.31 %	4.11 %	(2.85–6.45) %
combined multileptons ($WW^*, \tau\tau, ZZ^*$)	1.28 %	1.17 %	(0.85–1.73) %
$H \rightarrow \gamma\gamma$ ($B = 0.23\%$)	0.69 %	0.81 %	(0.60–1.17) %
combined multileptons + diphotons	0.56 %	0.65 %	(0.46–0.94) %

Study of Top-Higgs Coupling (tHq): $tHq \rightarrow bW \rightarrow lv \ q(H \rightarrow \gamma\gamma)$

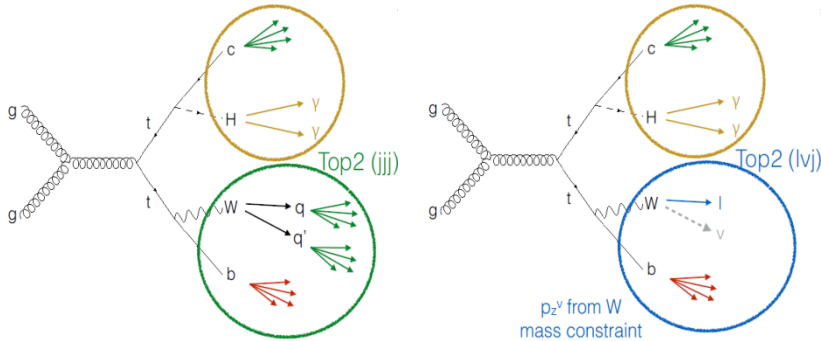

CMS-PAS-HIG-14-001

2 HDM Higgs: FCNC ($t \rightarrow qH$) Decays

Hadronic Channel
Top1 ($\gamma\gamma$)

Leptonic Channel
Top1 ($\gamma\gamma$)

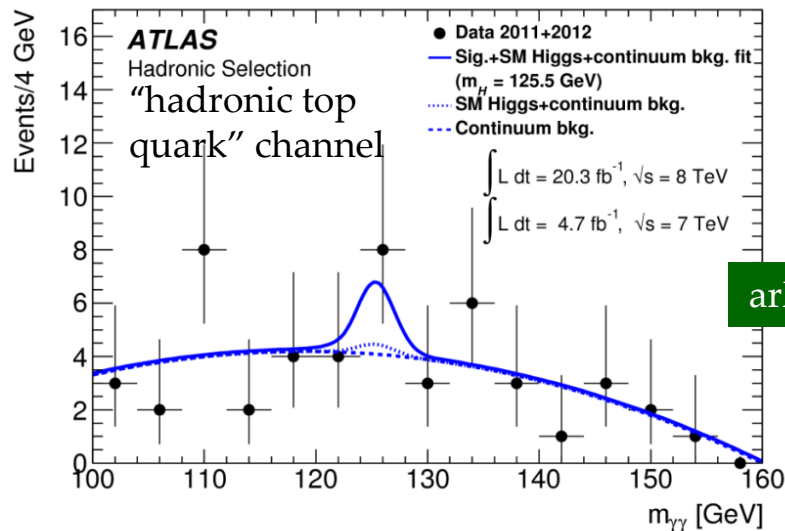

In 2 HDM Type III model (without flavor conservation)
The $c(u)H$ coupling is present at tree level

Search for FCNC $t \rightarrow qH$ done in top-pair events:
 $tt \rightarrow b(W \rightarrow ff) q(H \rightarrow \gamma\gamma)$

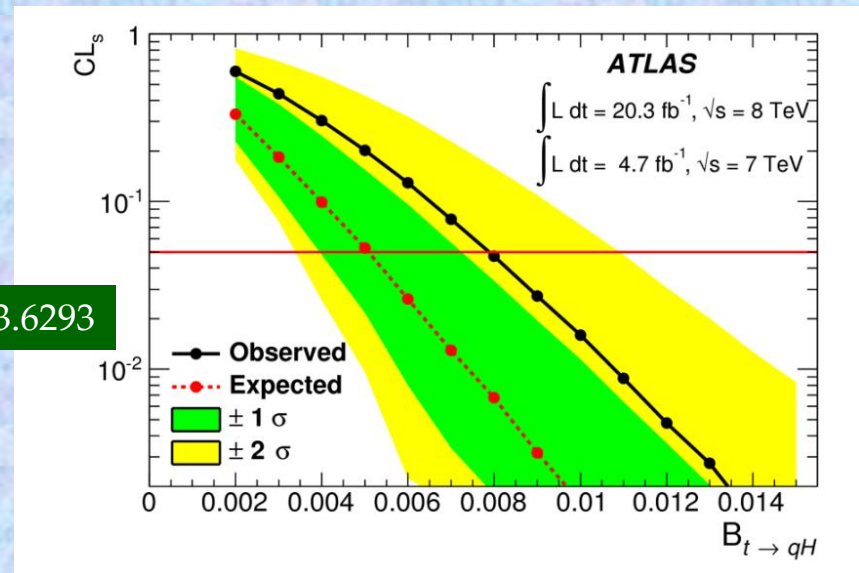

FCNC: $t \rightarrow qH$, where $H \rightarrow \gamma\gamma$

Other $t \rightarrow bW$, both leptonic & hadronic W decays used

Search for excess in $M_{\gamma\gamma}$ mass spectrum

CLs as a function of the FCNC branching ratio

Limit on
 $\text{Br}(t \rightarrow cH)$:

$B(t \rightarrow Hc) < 0.83\%$ (0.53%)

Observed (expected)

Limit on Higgs
Yukawa coupling

$$\lambda_{tcH} < 0.17 \text{ (0.14)}$$

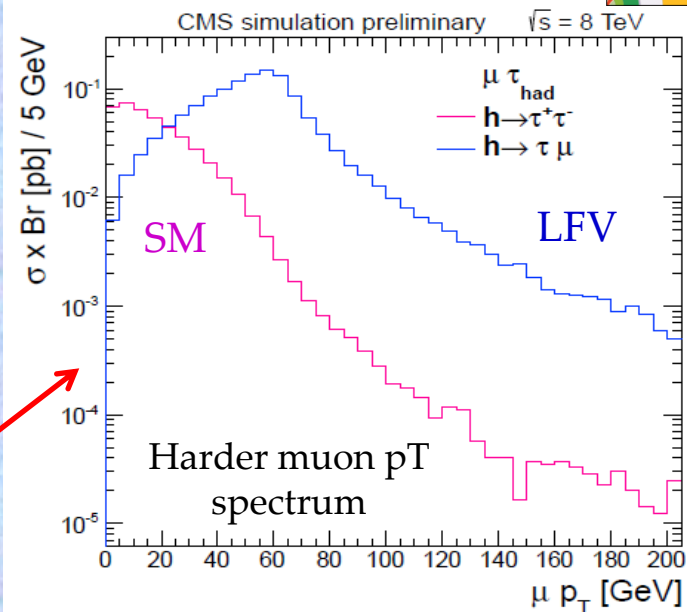

$$\sqrt{\lambda_{tcH}^2 + \lambda_{tuH}^2} < 0.17$$

Equally sensitive
to tuH and tcH :

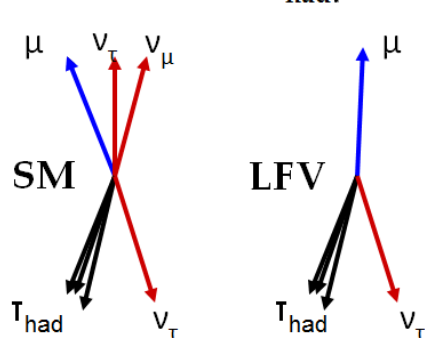

Searches for Lepton Flavor Violating Higgs Decays

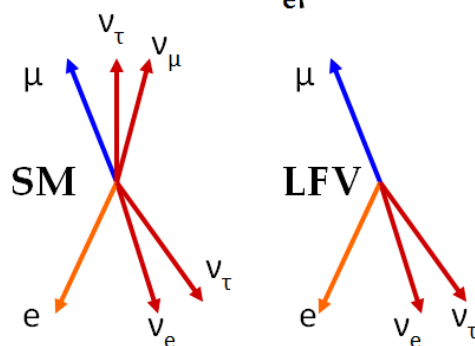

- Forbidden in the SM; naturally occur in 2HDM, composite Higgs, and Randall-Sundrum models
- Previous best limit from indirect searches:
 $B(H \rightarrow \mu\tau) < 10\%$ → reinterpretation of ATLAS $H \rightarrow \tau\tau$ searches and from $\tau \rightarrow \mu\gamma$ (arXiv:1209.1397)
- Can do better with the first dedicated search:
 $H \rightarrow \mu\tau_e$ and $H \rightarrow \mu\tau_{\text{had}}$ (within current LHC reach)
- Similar strategy as for $H \rightarrow \tau\tau$ (but kinematics differ)

Search for $H \rightarrow \tau_{\text{had}}\mu$

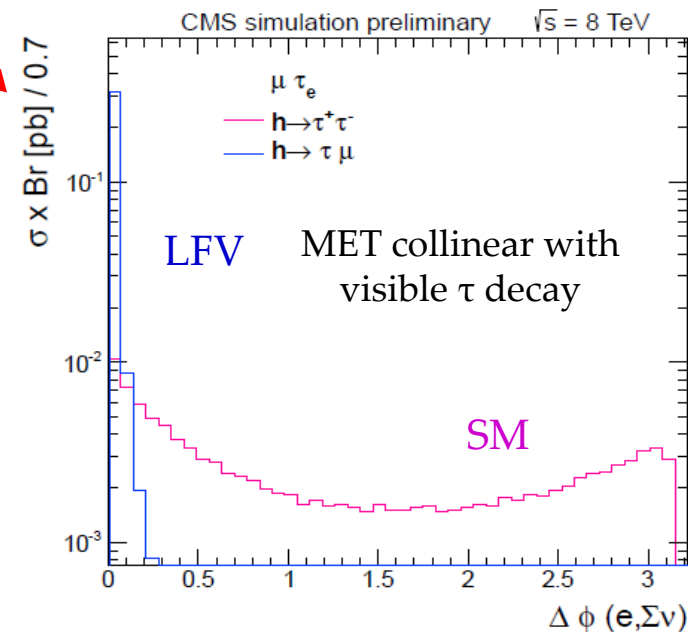

Search for $H \rightarrow \tau_e\mu$

❖ Exploit collinearity between tau and MET

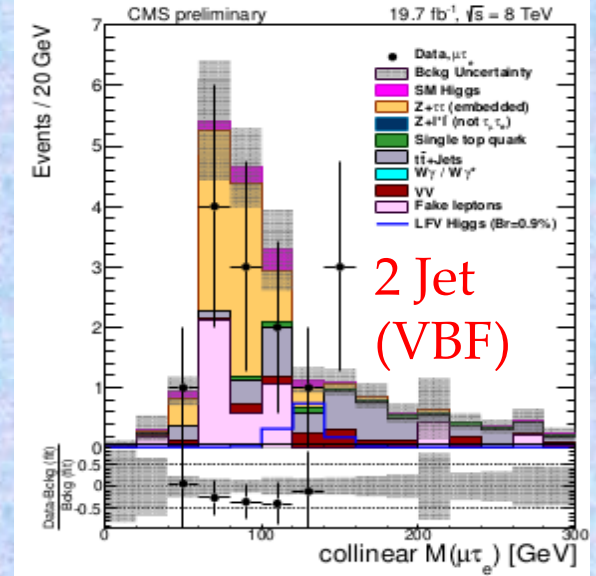

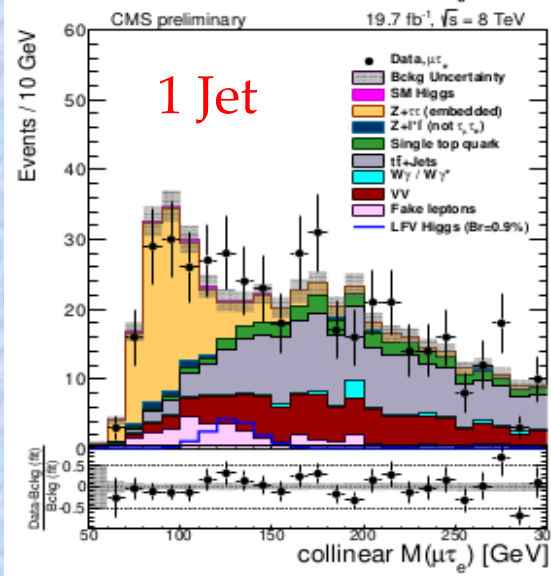

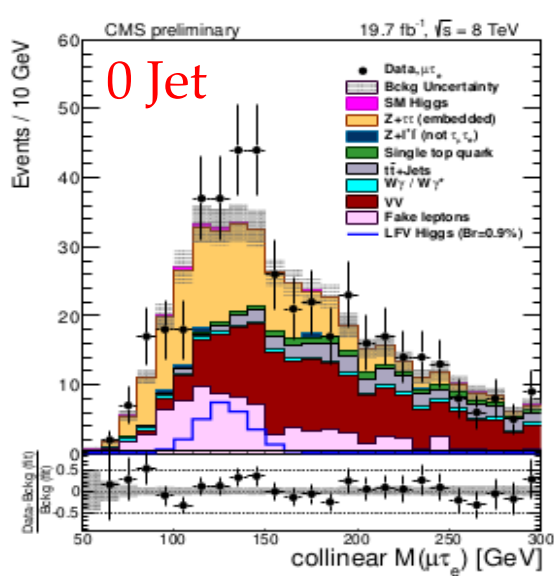

❖ Signal variable: "collinear mass", reconstructed from visible decay products

LFV Couplings: Search for $H \rightarrow \tau\mu$

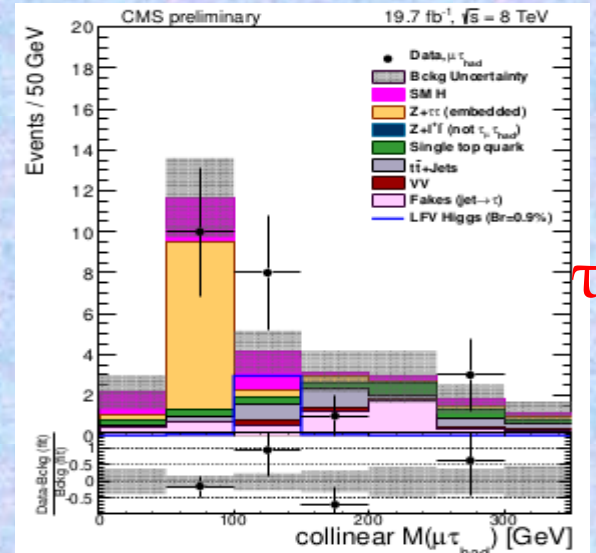

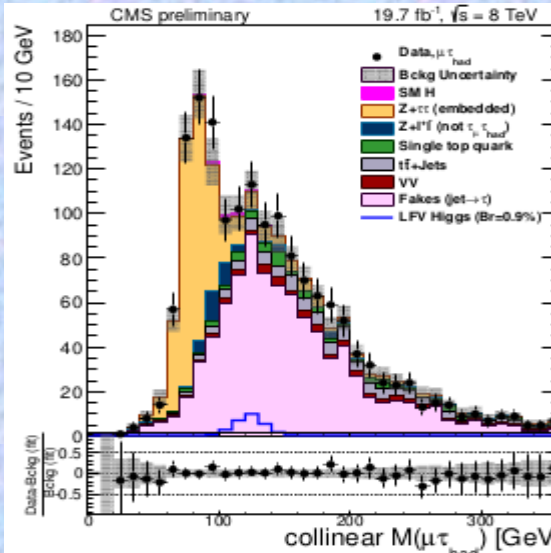

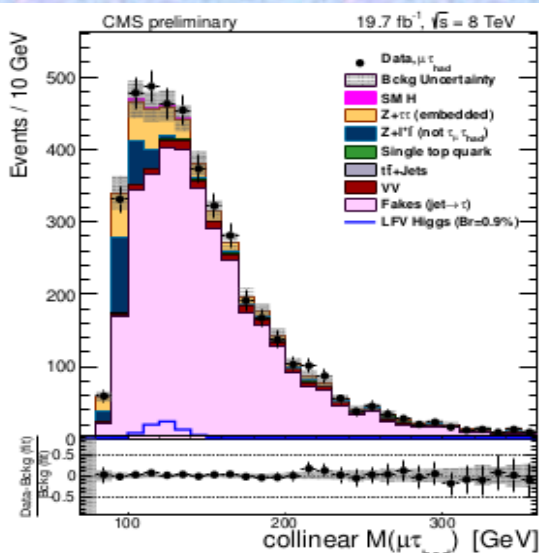

- ❖ Selection: isolated muon + isolated electron ($\mu\tau_e$) or hadronic tau candidate ($\mu\tau_{had}$)
- ❖ Categorize according to number of jets

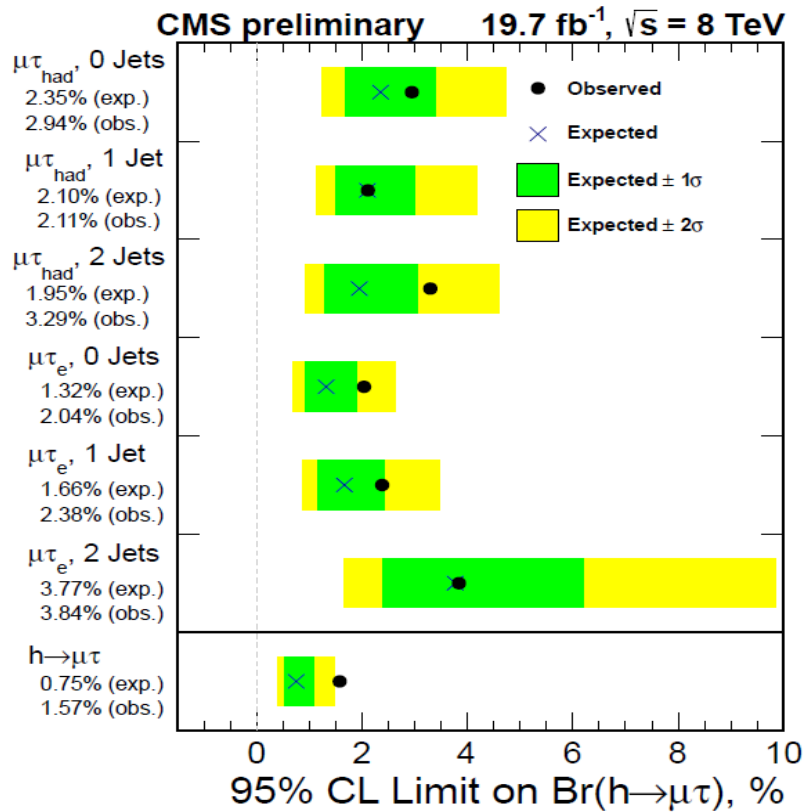

$\tau_e\mu$

CMS-PAS-HIG-14-005

$\tau_{had}\mu$

Limits on $\text{Br}(H \rightarrow \tau\mu)$ and Yukawa Coupling

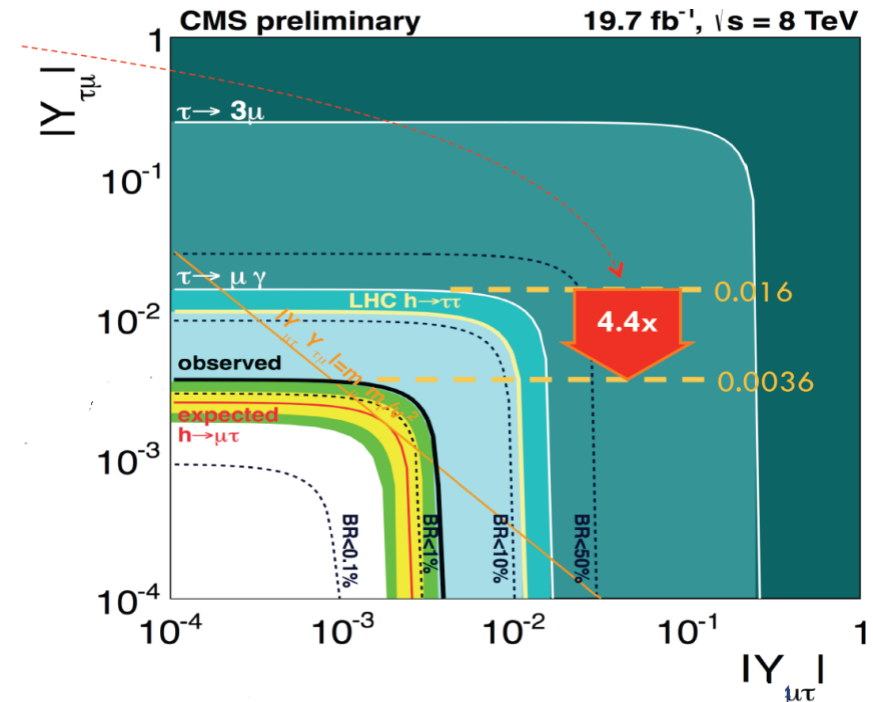

➤ $\text{Br}(H \rightarrow \tau\mu) < 1.57\%$ @ 95 CL observed
(expected $\text{Br}(H \rightarrow \mu\tau) < (0.75 \pm 0.38)\%$)

➤ Best fit: $\text{Br}(H \rightarrow \mu\tau) = (0.89 \pm 0.40)\%$

Mild excess in data at the level of 2.5σ
→ still compatible with the SM

Constraint on $\text{Br}(H \rightarrow \mu\tau)$ interpreted in terms of LFV Higgs Yukawa couplings

Promising future in the LFV Yukawa sector

➤ Significant improvement (4.4x) wrt. indirect measurements

- Previous best limit from $\tau \rightarrow \mu\gamma$:
 $\sqrt{|Y_{\mu\tau}|^2 + |Y_{\tau\mu}|^2} < 0.016$
- Observed limit:
 $\sqrt{|Y_{\mu\tau}|^2 + |Y_{\tau\mu}|^2} < 0.0036$

Best limits on τ anomalous Yukawa couplings to date

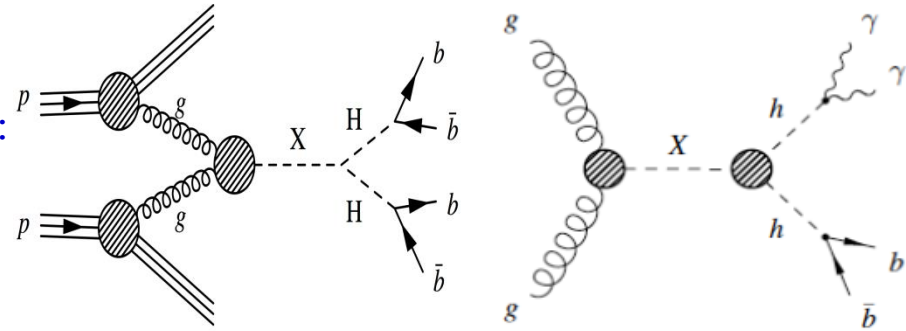

Alternative models

	CMS			ATLAS		
	L(fb ⁻¹)	Result	Reference	L(fb ⁻¹)	Result	Reference
Higgs Boson Pair Production (resonant, non-resonant)						
$hh \rightarrow \gamma bb$	20	$\sigma \times \text{BR, radion, graviton}$	CMS-HIG-13-032	20	$\sigma \times \text{BR, 2 HDM}$	arXiv: 1406.5053
$hh \rightarrow bbbb$	18	$\sigma \times \text{BR, radion, graviton}$	CMS-HIG-14-013	20	$\sigma \times \text{BR, graviton}$	ATLAS-CONF-2014-005
Resonant Searches (Extended Higgs sector):						
$X \rightarrow \gamma$	20	Mass range: 150-850 GeV	CMS-HIG-14-006	20	Mass range: 65-600 GeV	arXiv: 1407.6583

Higgs Boson Pair Production ($X \rightarrow hh$)

- ❖ SM: rate of Higgs pair production is very small
- ❖ BSM (rate of resonant hh production enhanced):
 - Heavy(N)MSSM Higgs: $H \rightarrow h(125)h(125)$
 - Radion or Kaluza-Klein excitation of graviton (Warped Extra Dimensions)

Model Independent Analysis \rightarrow results interpreted in terms of spin-0 (radion) or spin-2 (KK graviton):

- $hh \rightarrow \gamma\gamma b\bar{b}$: large BR($H \rightarrow b\bar{b}$), low bkg., good mass resolution ($H \rightarrow \gamma\gamma$)

ATLAS (260-550 GeV):

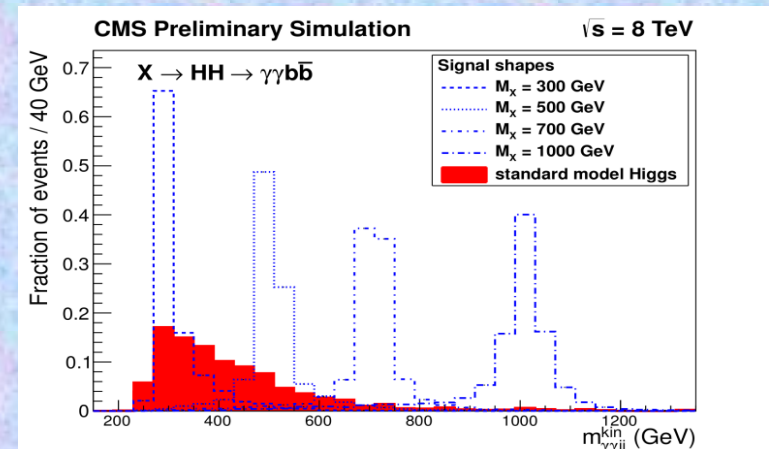

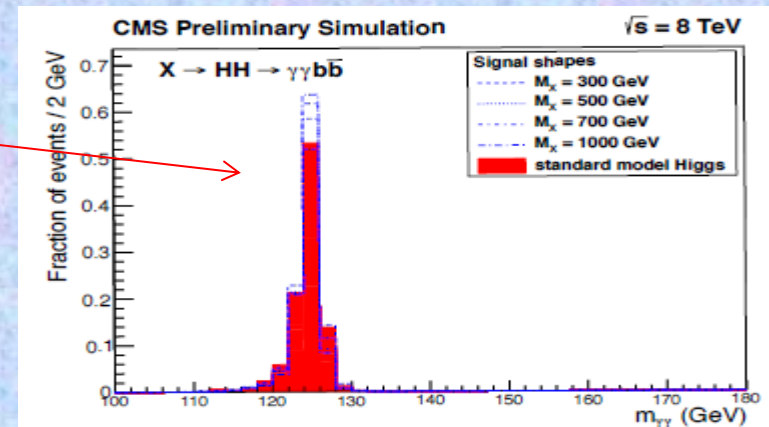

- Non resonant: fit to unbinned $m_{\gamma\gamma}$
- Resonant production : counting experimnt

CMS (260-1100 GeV):

- Low mass ($m_X < 400$ GeV) \rightarrow fit to $m_{\gamma\gamma}$ spectrum
- High mass ($m_X > 400$ GeV) \rightarrow fit to the $m_{\gamma\gamma jj}$

- $hh \rightarrow b\bar{b}b\bar{b}$: Increased sensitive at high mass

ATLAS/CMS: 4b-tagged jets, veto $t\bar{t}b\bar{a}$ events

Search for Higgs Boson Pair Production: $hh \rightarrow (\gamma\gamma)(bb)$ Final State

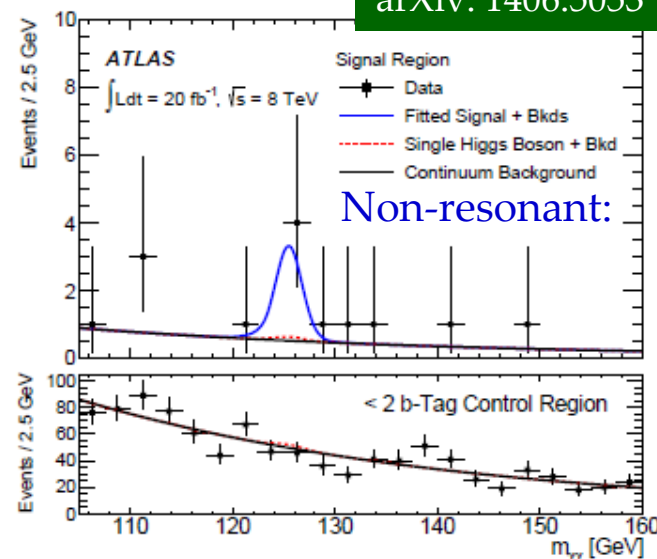

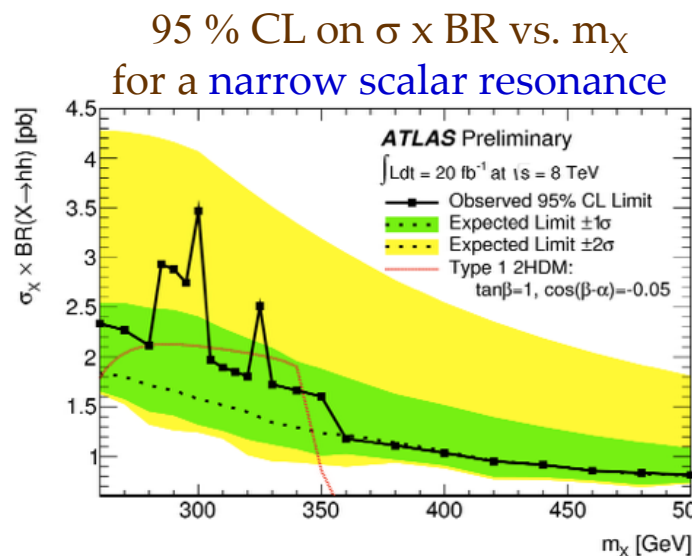

arXiv: 1406.5053

ATLAS: non-resonant and resonant (2 HDM model)

Spin-0 benchmark,
 $260 < m_X < 500$ GeV

➤ Resonant : 2.1σ max.
deviation (incl. LEE)

➤ Non-resonant
(assuming SM $\text{Br}(h)$):
 $\sigma < 2.2$ pb obs. (1.0 exp.)

CMS-PAS-HIG-13-032

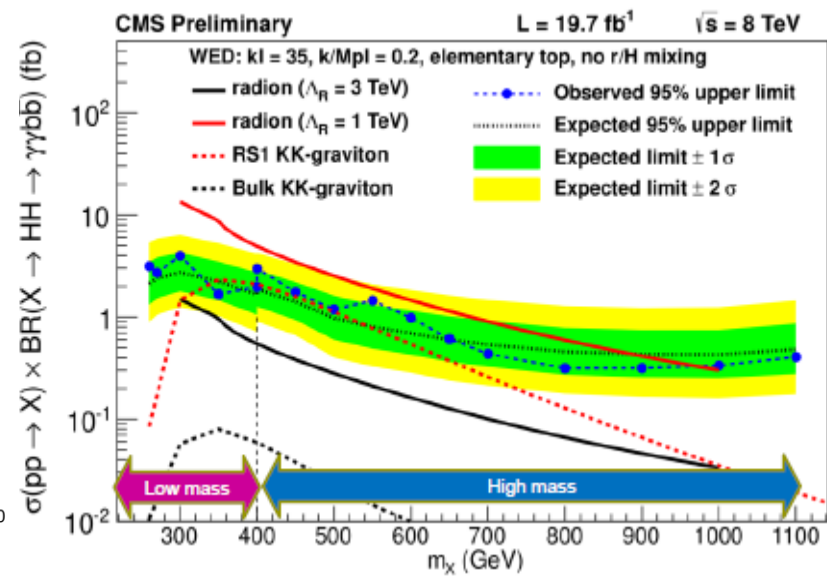

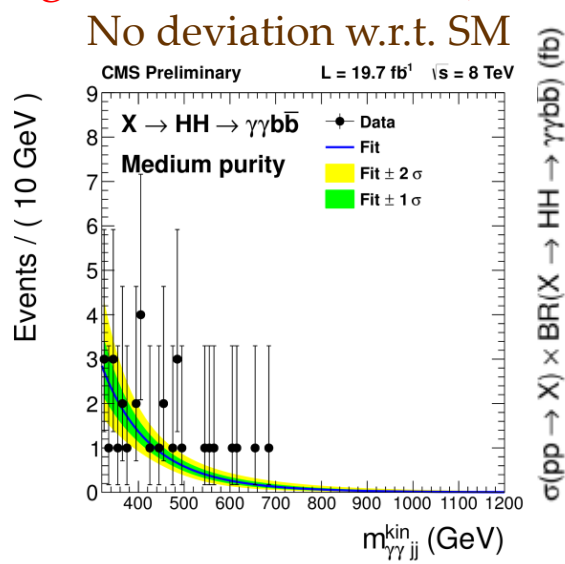

CMS: resonant search (KK-graviton and radion)

Spin-0 (2) benchmarks
 $260 < m_X < 1100$ GeV

Exclude:

❖ Radions : $m_X < 970$ GeV;
radion scale $\Lambda_R = 1 \text{ TeV}$

❖ RS1 KK-graviton : mass
range $340 < m_X < 400$ GeV.

Search for $X \rightarrow hh \rightarrow (bb)(bb)$ Final State

ATLAS searches:

➤ TeV resonance decaying into pair of SM Higgs bosons

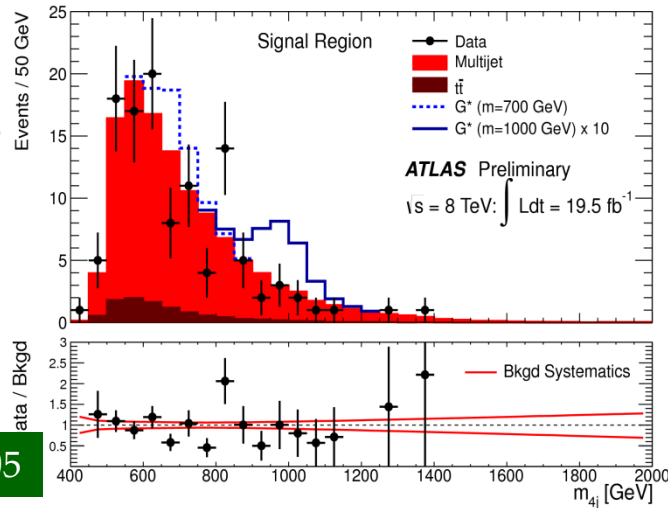

❖ KK Graviton

Excluded:

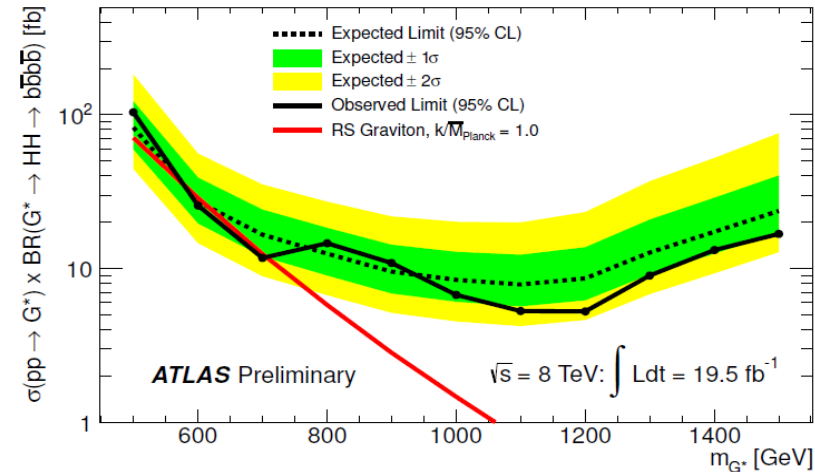

$590 < m_X < 710$ GeV

ATLAS-CONF-2014-005

Signal region (m_{4j}) mass
(90% bkg. From multijet +10% ttbar)

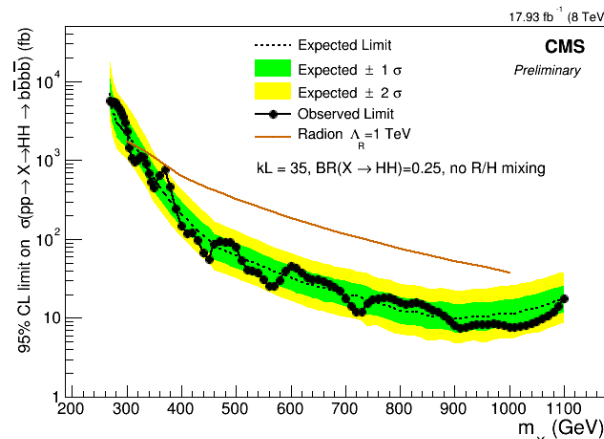

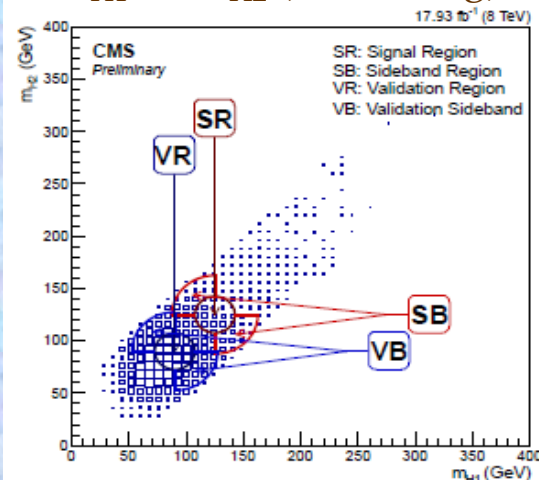

95 % CL on $\sigma \times \text{BR}$ vs. m_X
for a KK excitation of graviton

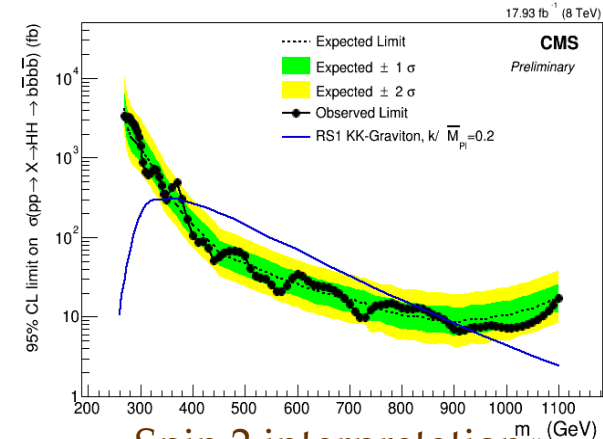

CMS Searches → see Conference Poster Caterina Vernieri

CMS-PAS-HIG-14-013

m_{H1} vs m_{H2} (after b-tag)

Spin 0 interpretation

Spin 2 interpretation

+20-30% signal efficiency

We Have to Exploit All Opportunities !!!

- Run I ATLAS/CMS searches covered a large range of BSM Higgs boson signatures
→ narrowing the the phase space for the (N)MSSM models
- LHC is the discovery machine
→ the adventure in the TeV energy regime has just begun

Run II will open new horizons for an exciting future Higgs Physics program

... Preparing for the LHC Restart ...
