Globalization

0. Sooner or later, it will be necessary to unify the project on the energy frontier.
   - Only one machine in the world.
   - Any country wants to contribute.

1. Then we may have to unify the organization.
   - Only one central lab in the world.
   - All industries in the world will be accessible.

2. What about small experiments such as $\nu$, rare decays, etc.?
   - Keep & develop activities at local labs, which work as branches of the central lab.
     - These branch labs still have global identity.
     - Branches may compete in physic output to each other or to the central lab.
   - Other fields of science, such as photon science, may have to be involved.
   - A country should contribute to the central lab more than to the branch.

    - Branches may compete in physic output to each other or to the central lab.
  - Other fields of science, such as photon science, may have to be involved.
  - A country should contribute to the central lab more than to the branch.

It is the time to start the discussion!
