We know...

...nothing

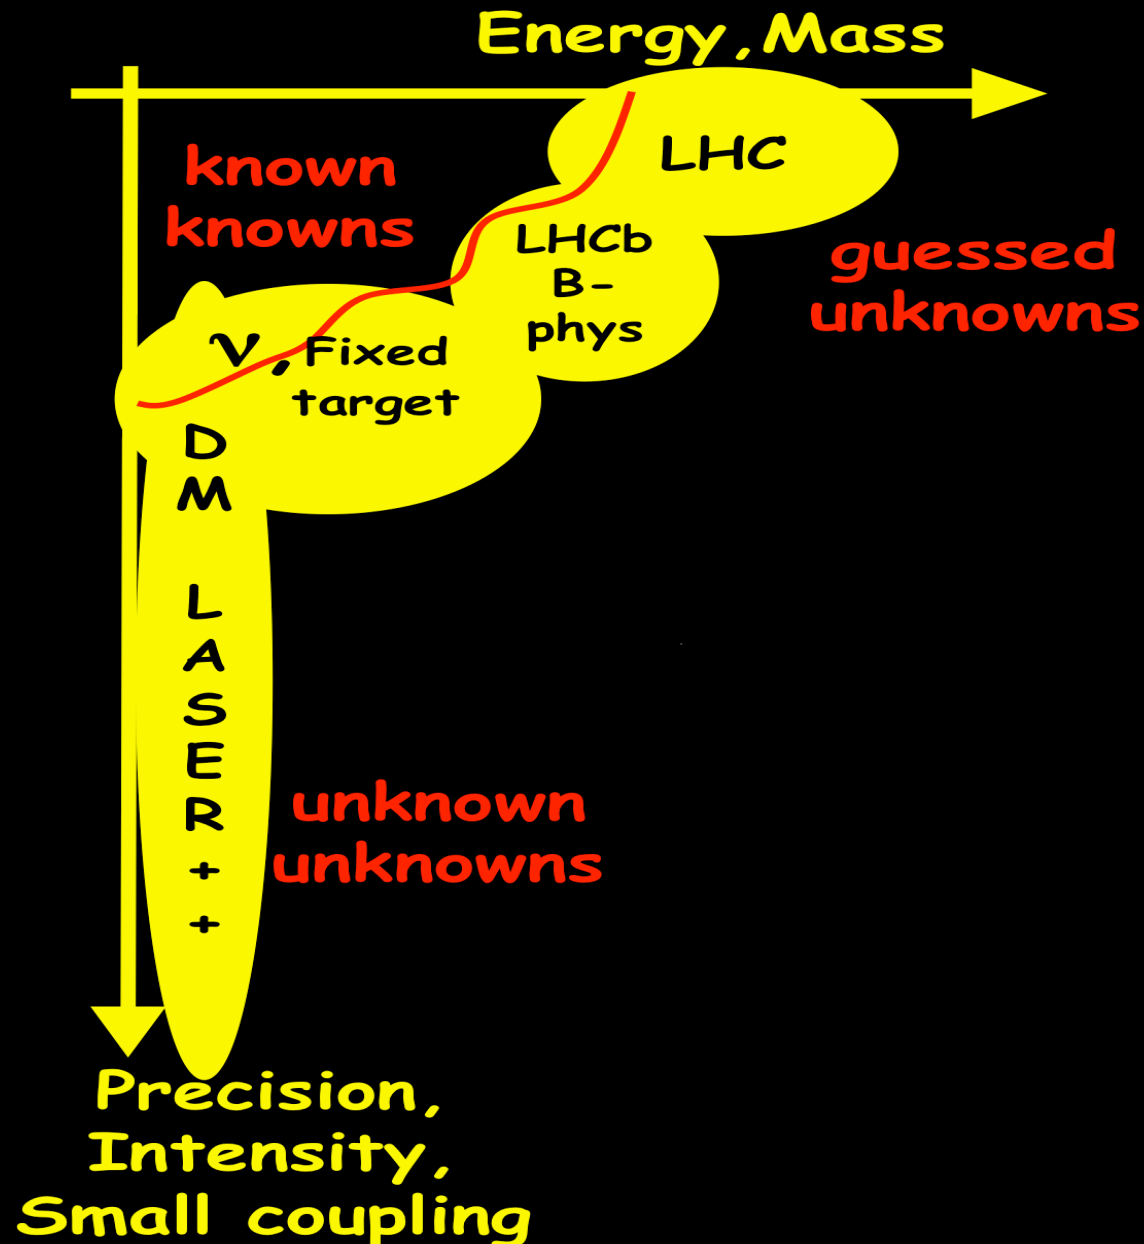

Inventory of the Universe

Where does physics
beyond the SM
hide?

Exploring is (at least) 2 dimensional

Example WISP:

(Weakly Interacting Sub-eV Particle)

Axions in a nutshell

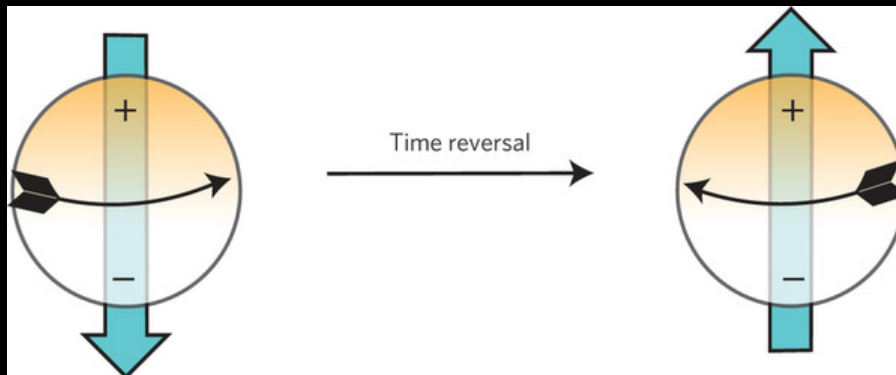

A dirty little secret...

$$S = \int d^4x \left[-\frac{1}{4} G^{\mu\nu} G_{\mu\nu} - \frac{\theta}{4} G^{\mu\nu} \tilde{G}_{\mu\nu} + i\bar{\psi} D_\mu \gamma^\mu \psi + \bar{\psi} M \psi \right]$$

” $\sim \theta \vec{E} \cdot \vec{B}$ ”

- The θ -term violates time reversal (T=CP)!
- Connected to strong interactions!

➔ Electric dipole moment
of the neutron!

Not found
➔ $\theta \sim 0!!!$

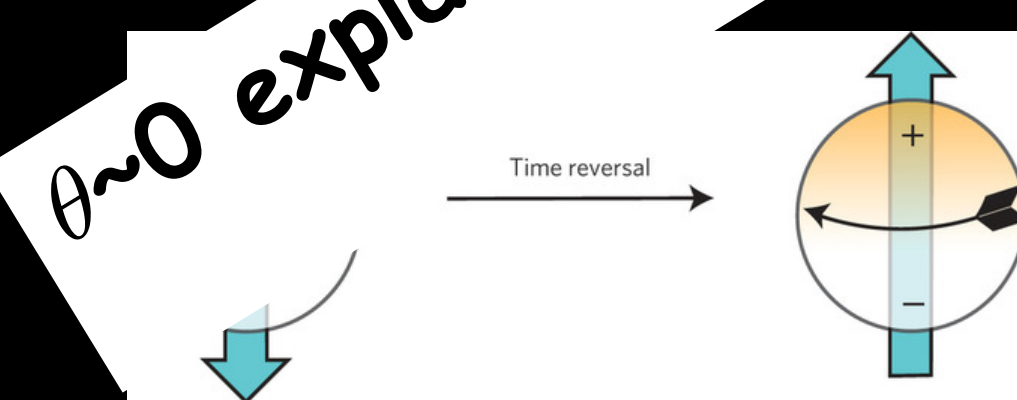

A dirty little secret...

$$S = \int d^4x \left[-\frac{1}{4} G^{\mu\nu} G_{\mu\nu} - \frac{\theta}{4} G^{\mu\nu} \tilde{G}_{\mu\nu} + i\bar{\psi} \gamma_5 \psi \right]$$

" $\sim \theta \vec{E} \cdot \vec{B}$

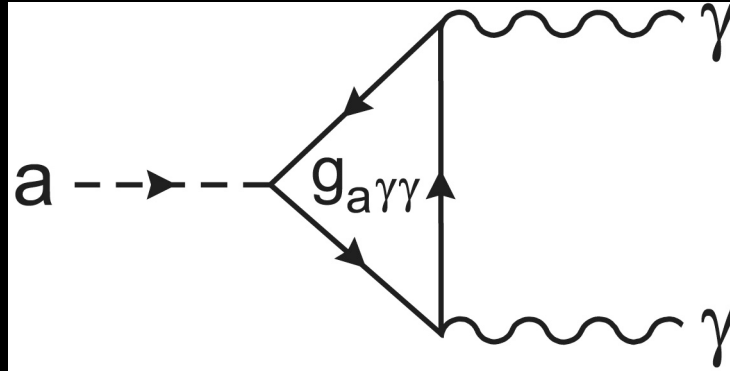

- The θ -term violates time reversal symmetry (CP)!
- Connected to strong CP problem!

Electric dipole moment of neutron!

Not found
 $\Rightarrow \theta \sim 0!!!$

Axion is light + couples to two photons

small $< \text{eV}$

$$\mathcal{L} = -\frac{1}{4}F^{\mu\nu}F_{\mu\nu} + \frac{1}{2}\partial_\mu a\partial^\mu a - m^2 a^2 - \frac{1}{4}g_{a\gamma\gamma}aF^{\mu\nu}\tilde{F}_{\mu\nu} + \dots$$

Coupling to two photons

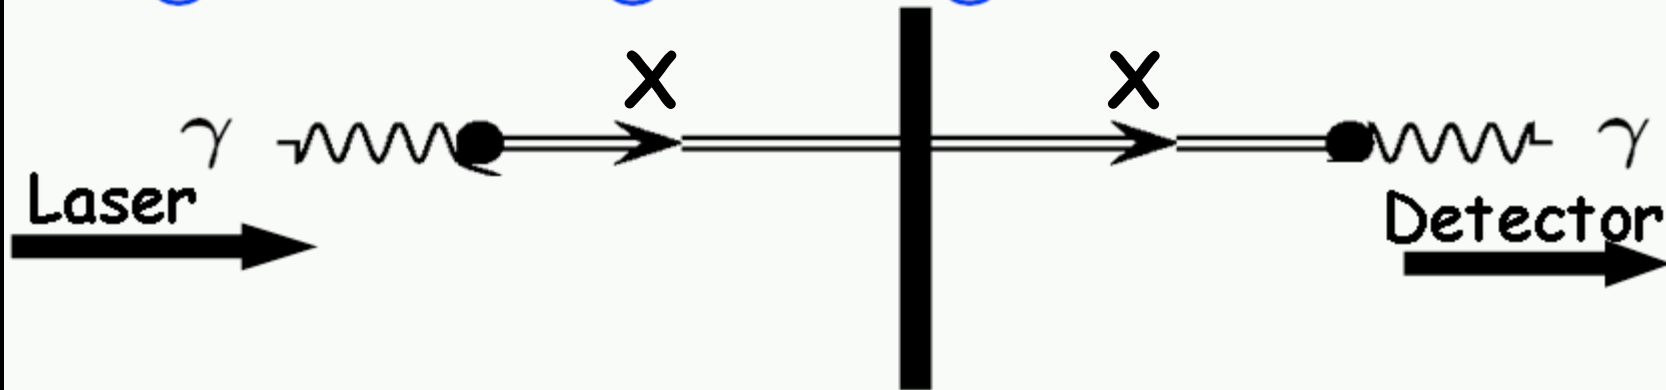

Very very weak $g_{a\gamma\gamma} \sim \frac{\alpha}{2\pi f_a}$

Because: Very large

Searching Axioms in the lab

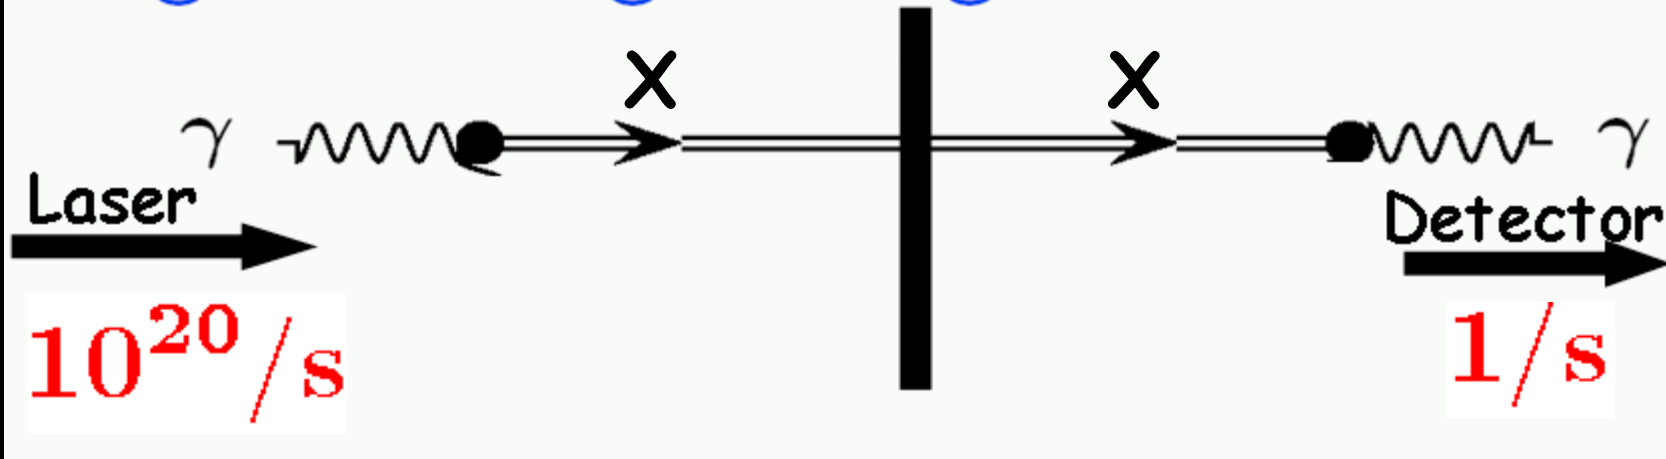

Light shining through walls

“Light shining through a wall”

Light shining through walls

“Light shining through a wall”

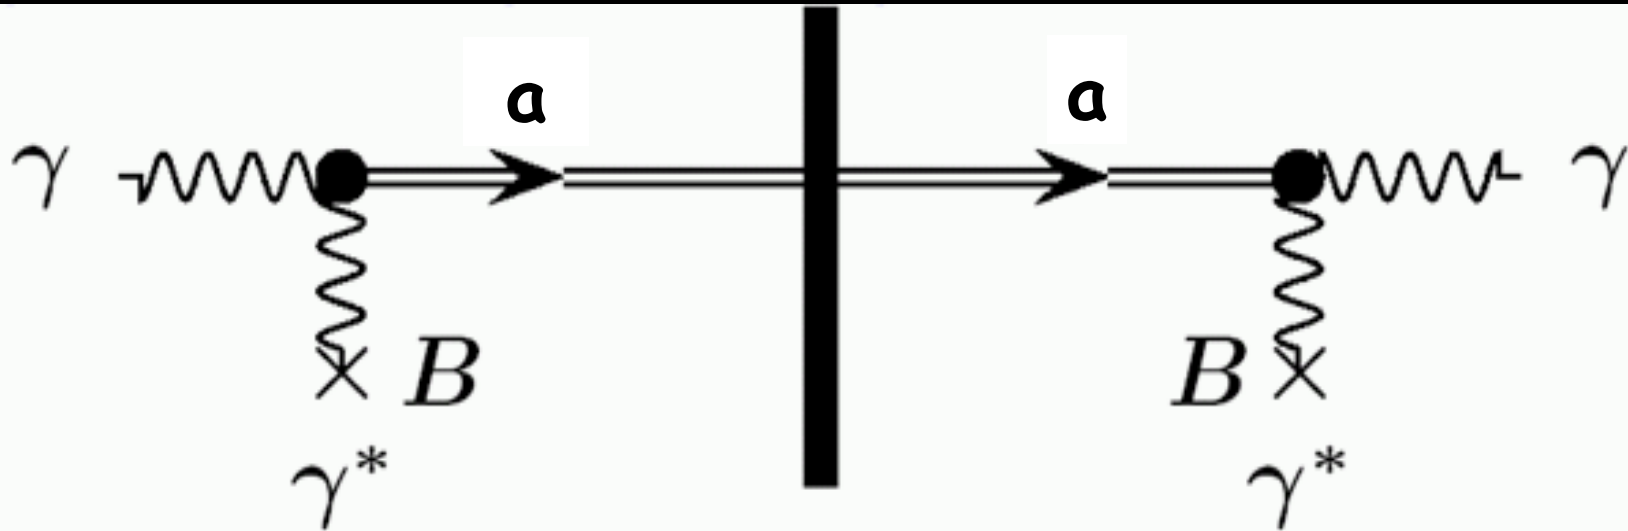

- **Test** $P_{\gamma \rightarrow X \rightarrow \gamma} \lesssim 10^{-20}$
- Enormous precision!
- Study extremely weak couplings!

Photons coming through the wall!

- It could be Axion(-like particle)s!

- Coupling to two photons: $\frac{1}{M} a \tilde{F} F \sim \frac{1}{M} a \vec{E} \cdot \vec{B}$

$$P_{\gamma \rightarrow a \rightarrow \gamma} \sim N_{\text{pass}} \left(\frac{BL}{M} \right)^4$$

Light Shining Through Walls

- A lot of activity

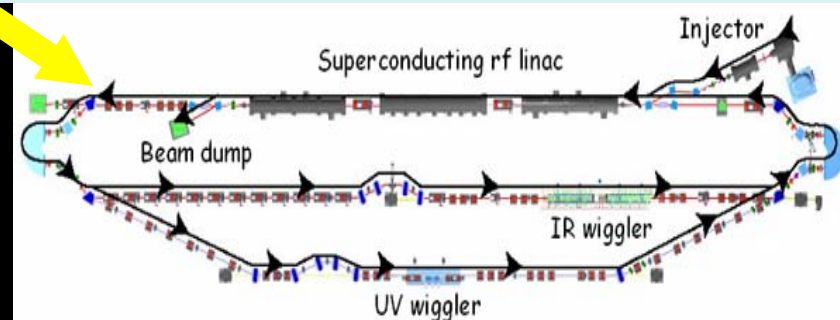

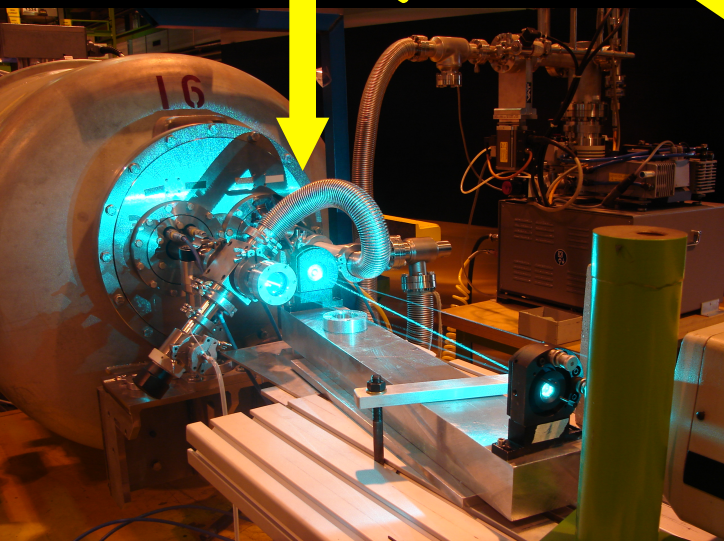

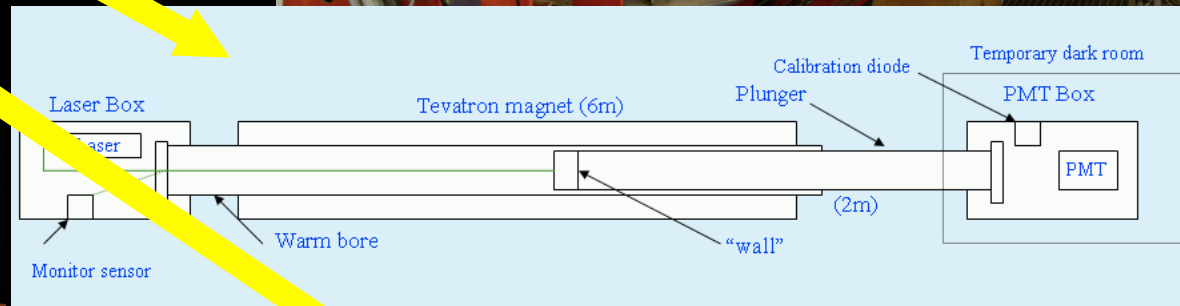

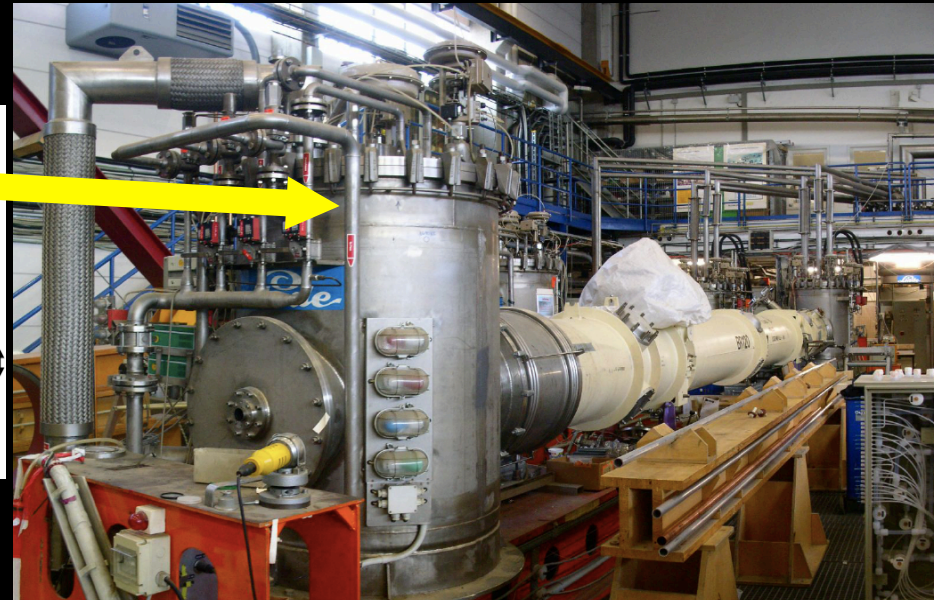

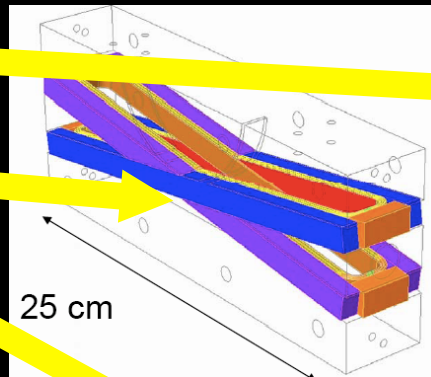

- ALPS

- BMV

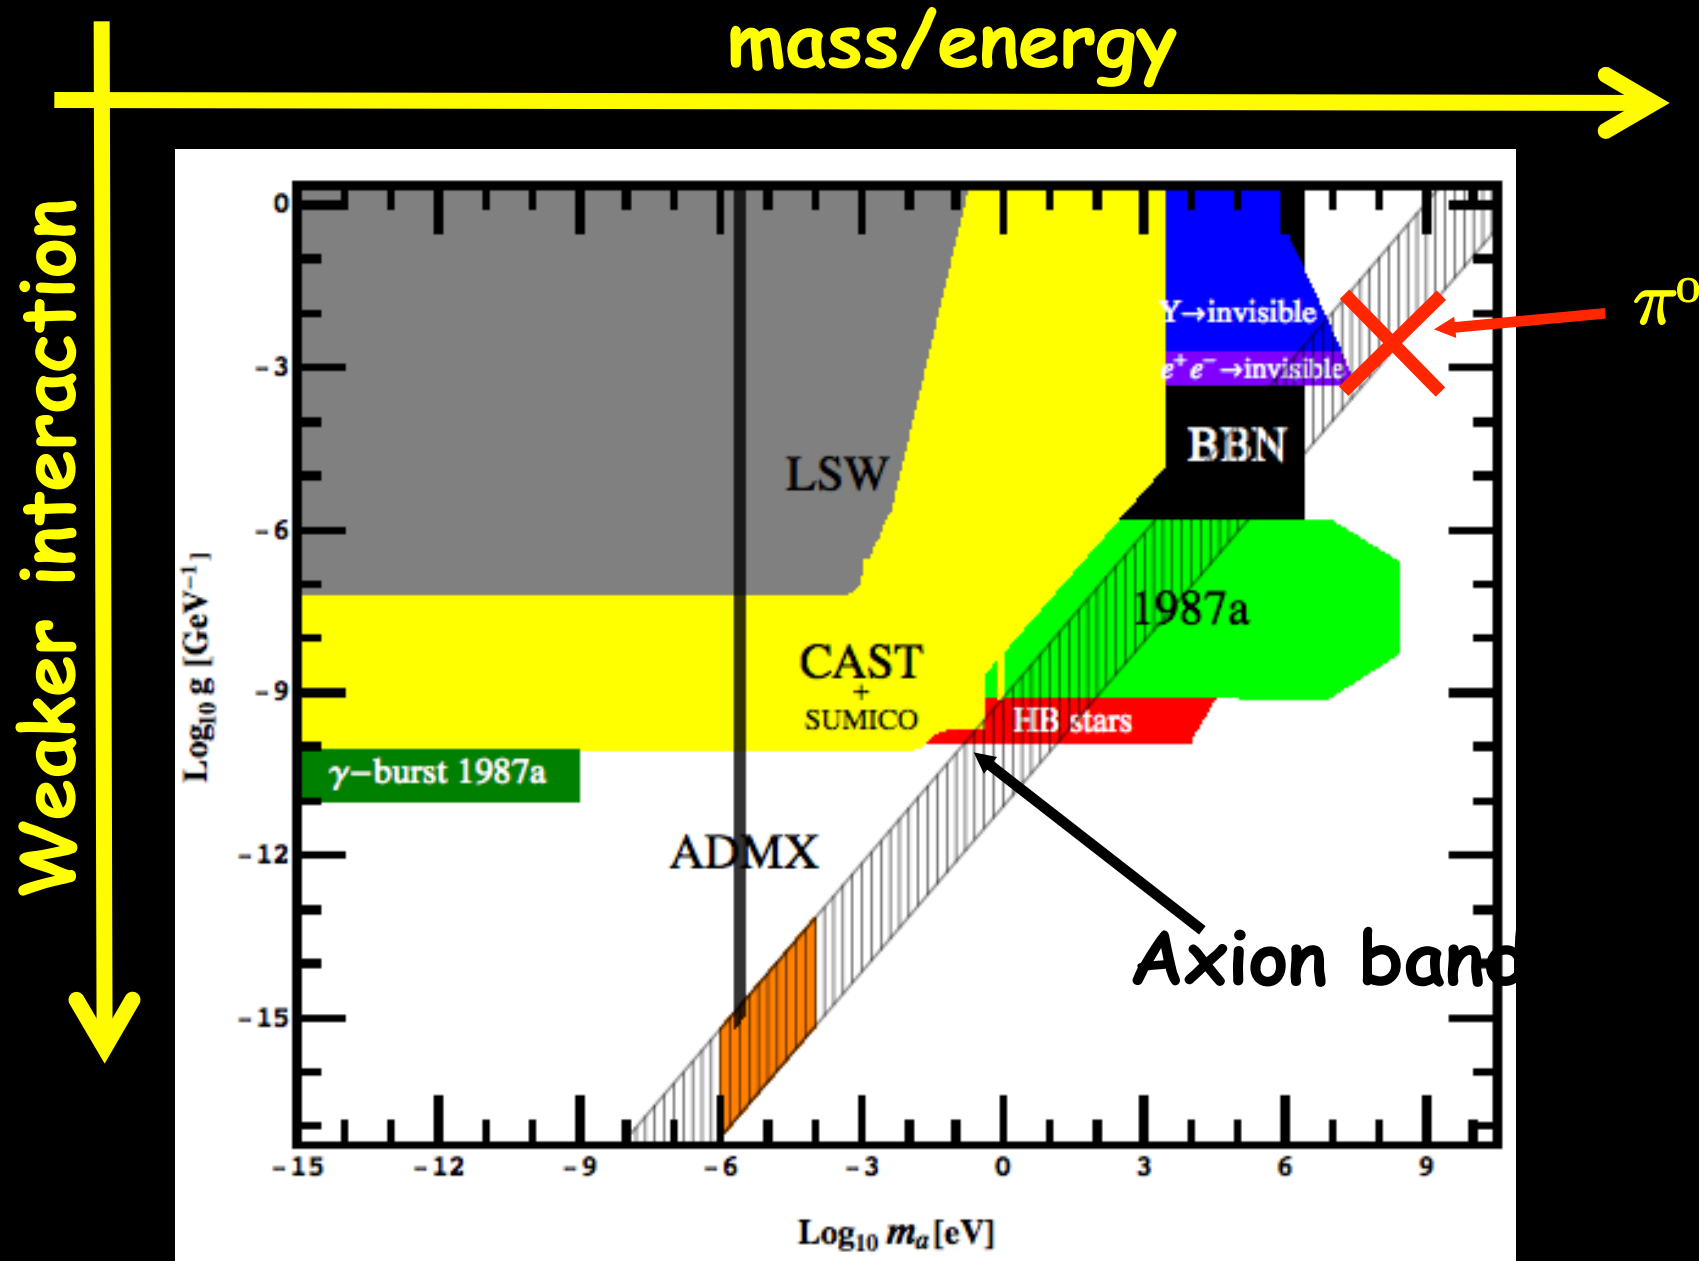

- GammeV

- LIPPS

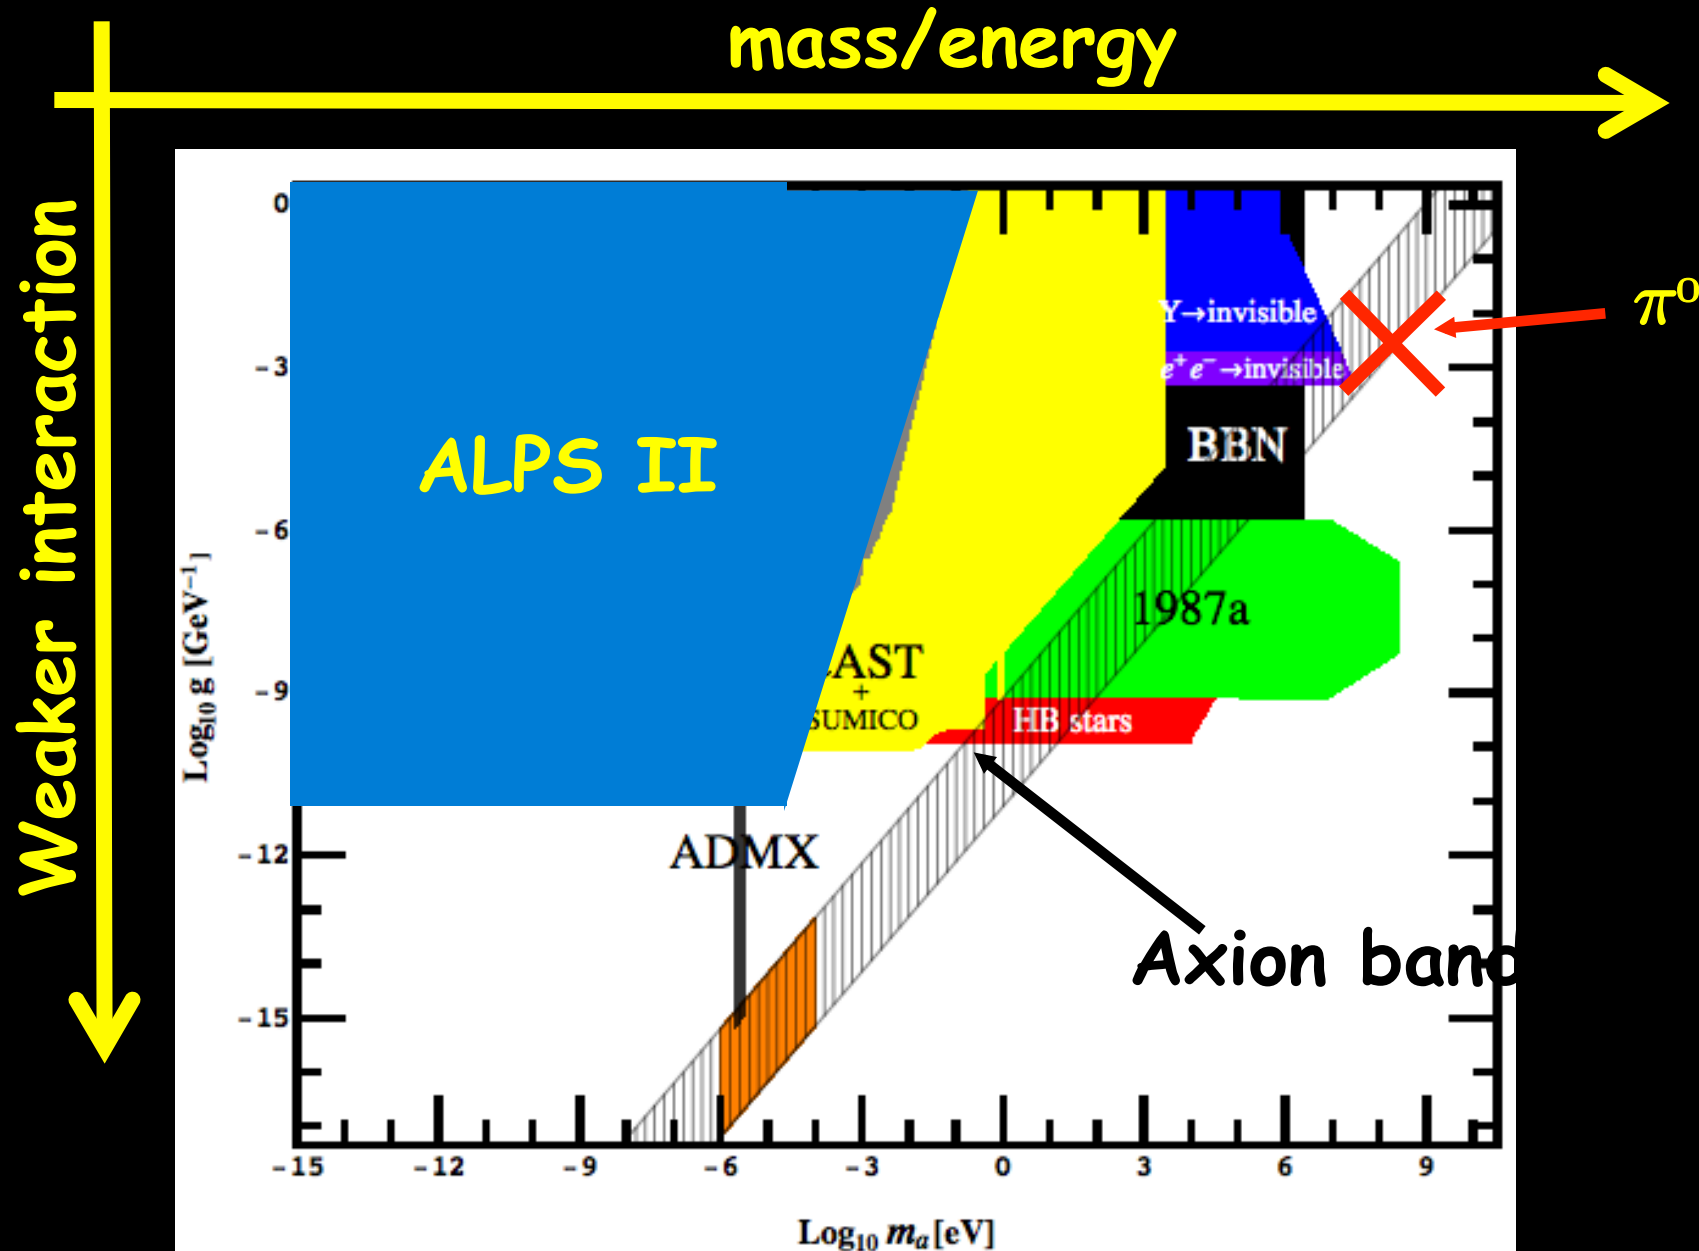

- OSQAR

Small coupling, small mass

Small coupling, small mass

Dark Matter(s)

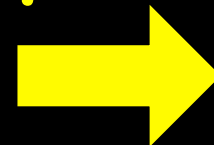

Can Dark Matter be WISPy?

(Weakly Interacting Sub-eV Particley)
Slim

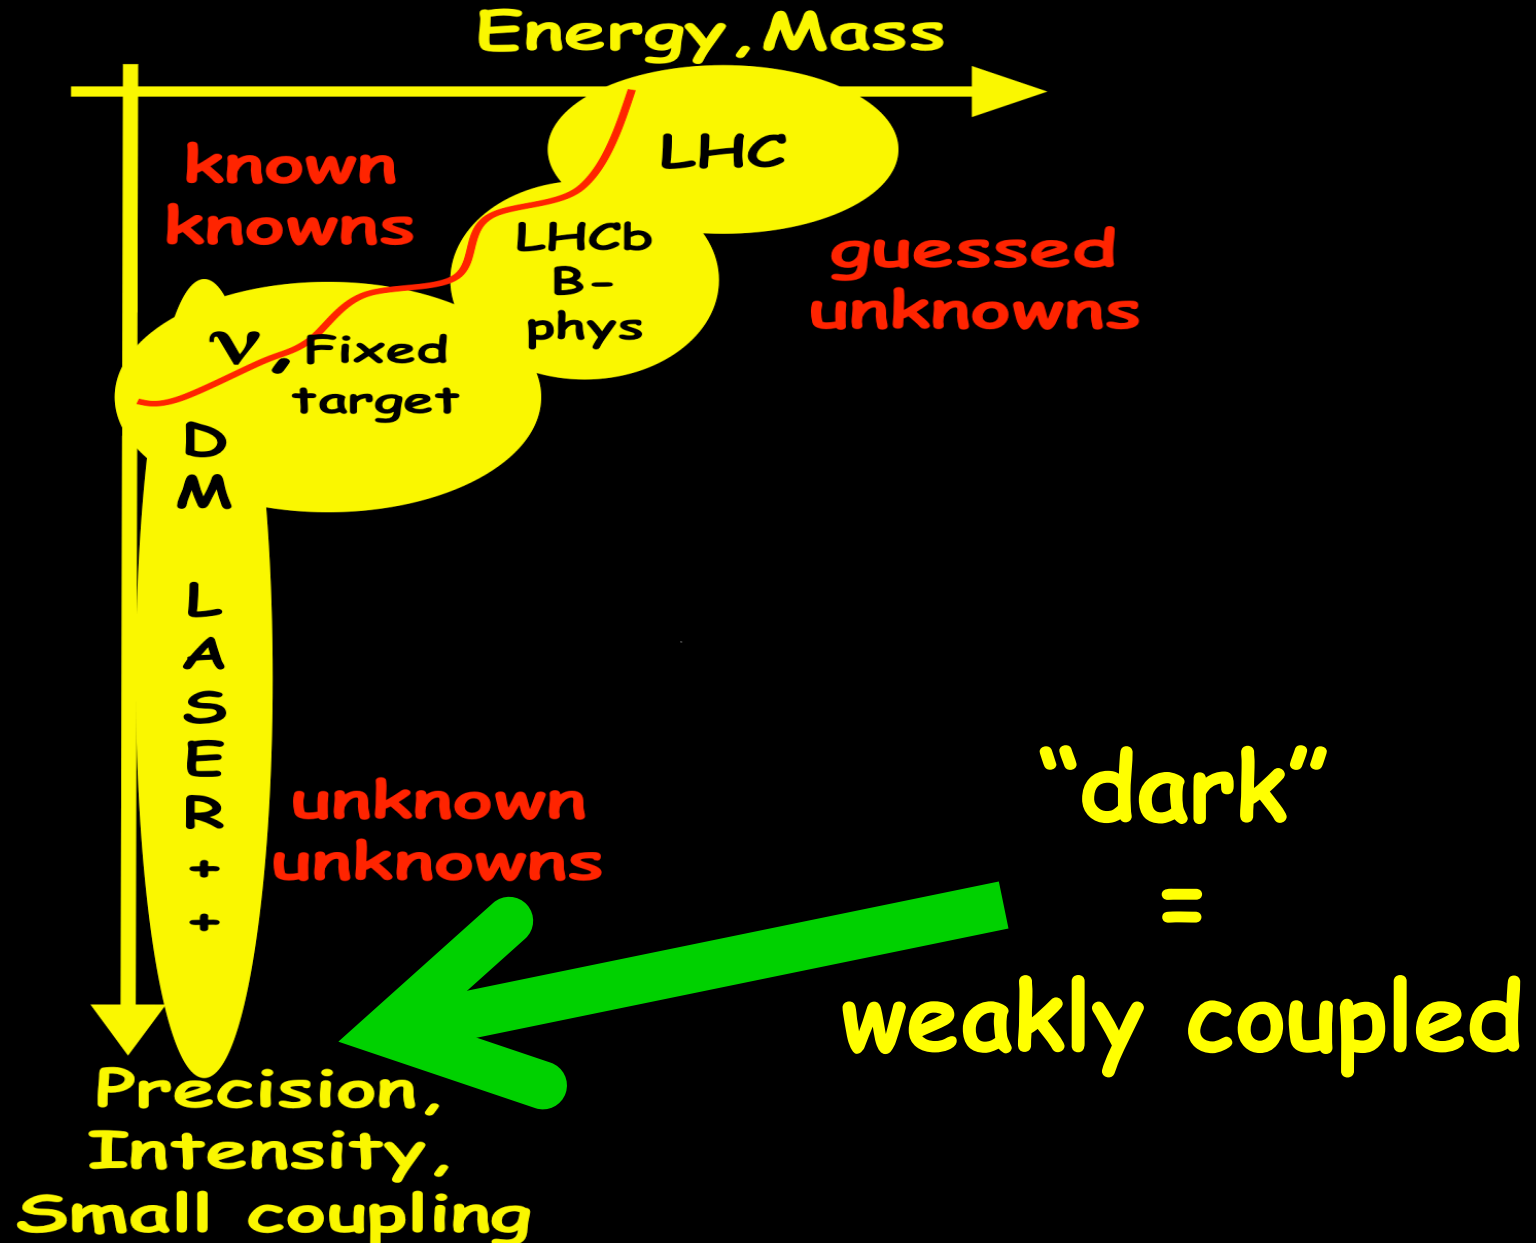

Properties of Dark Matter

- Dark matter is dark, i.e.
it doesn't radiate!
(and also doesn't absorb)
- very, very weak interactions with light
and with ordinary matter
- Exactly the property of
WISPs

Exploring is (at least) 2 dimensional

A common prejudice

- Dark Matter has to be heavy: $m_{\text{DM}} \gtrsim \text{keV}$.
- Prejudice based on thermal production!
and/or fermionic DM!

Both assumptions give minimal velocity
(thermal/Fermi)

→ galaxy, i.e. structure, formation inhibited!

Weakly interacting sub-eV DM

- Has to be non-thermally (cold!!!) produced

➡ See misalignment mechanism ✓

- Bosonic!

➡ Axion(-like particles)
Hidden Photons ✓

Dark matter has to be heavy...

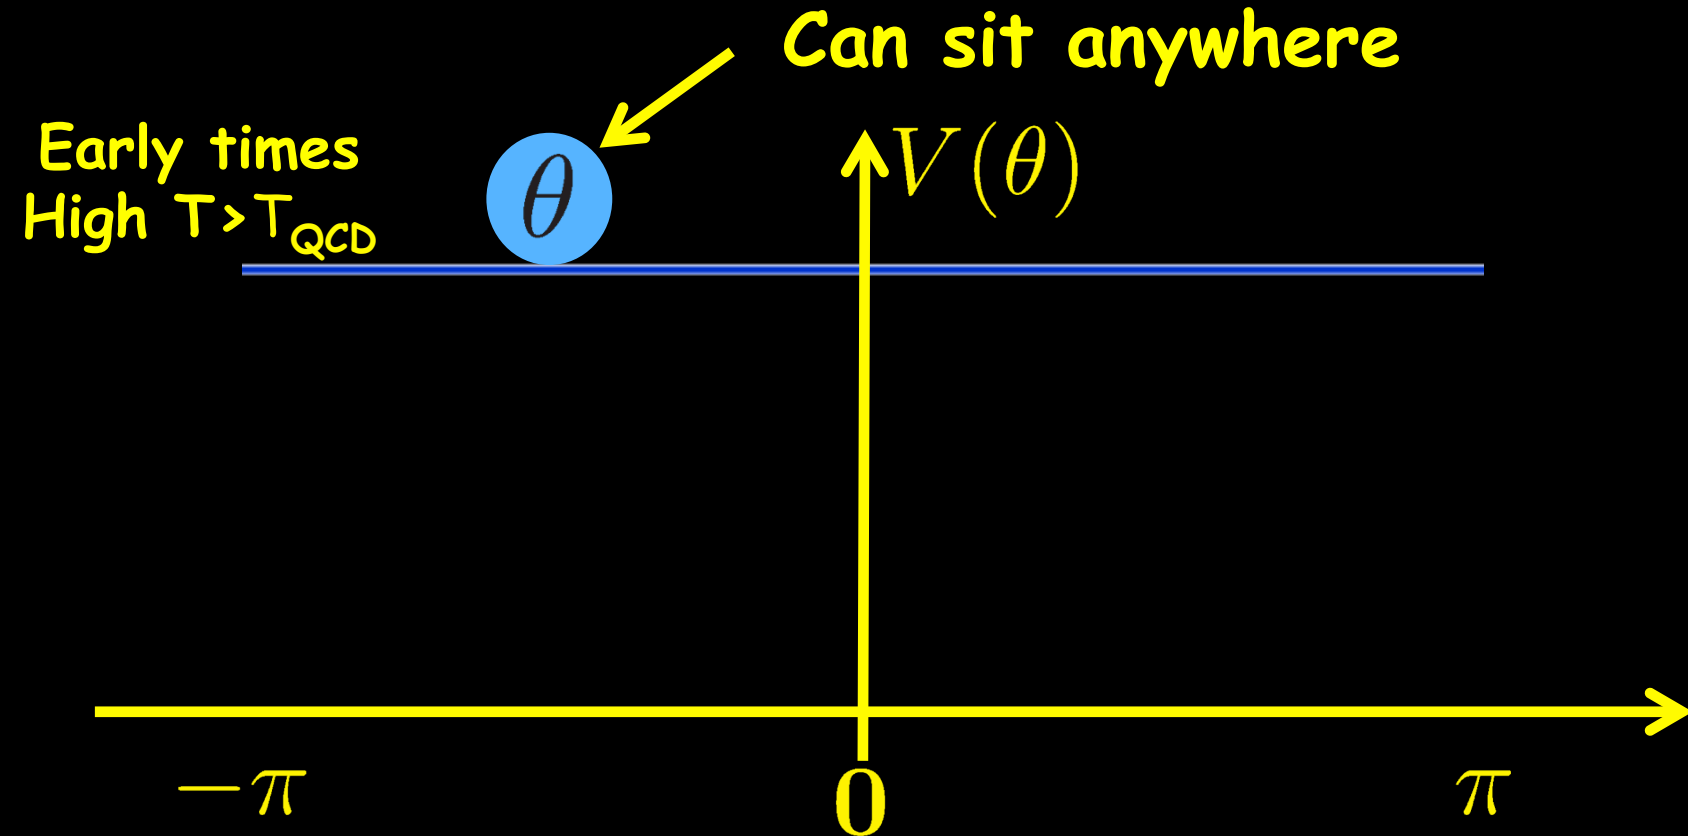

Dark matter has to be heavy $m_{\text{DM}} \gtrsim \text{keV}?$

Dark matter has to be heavy...

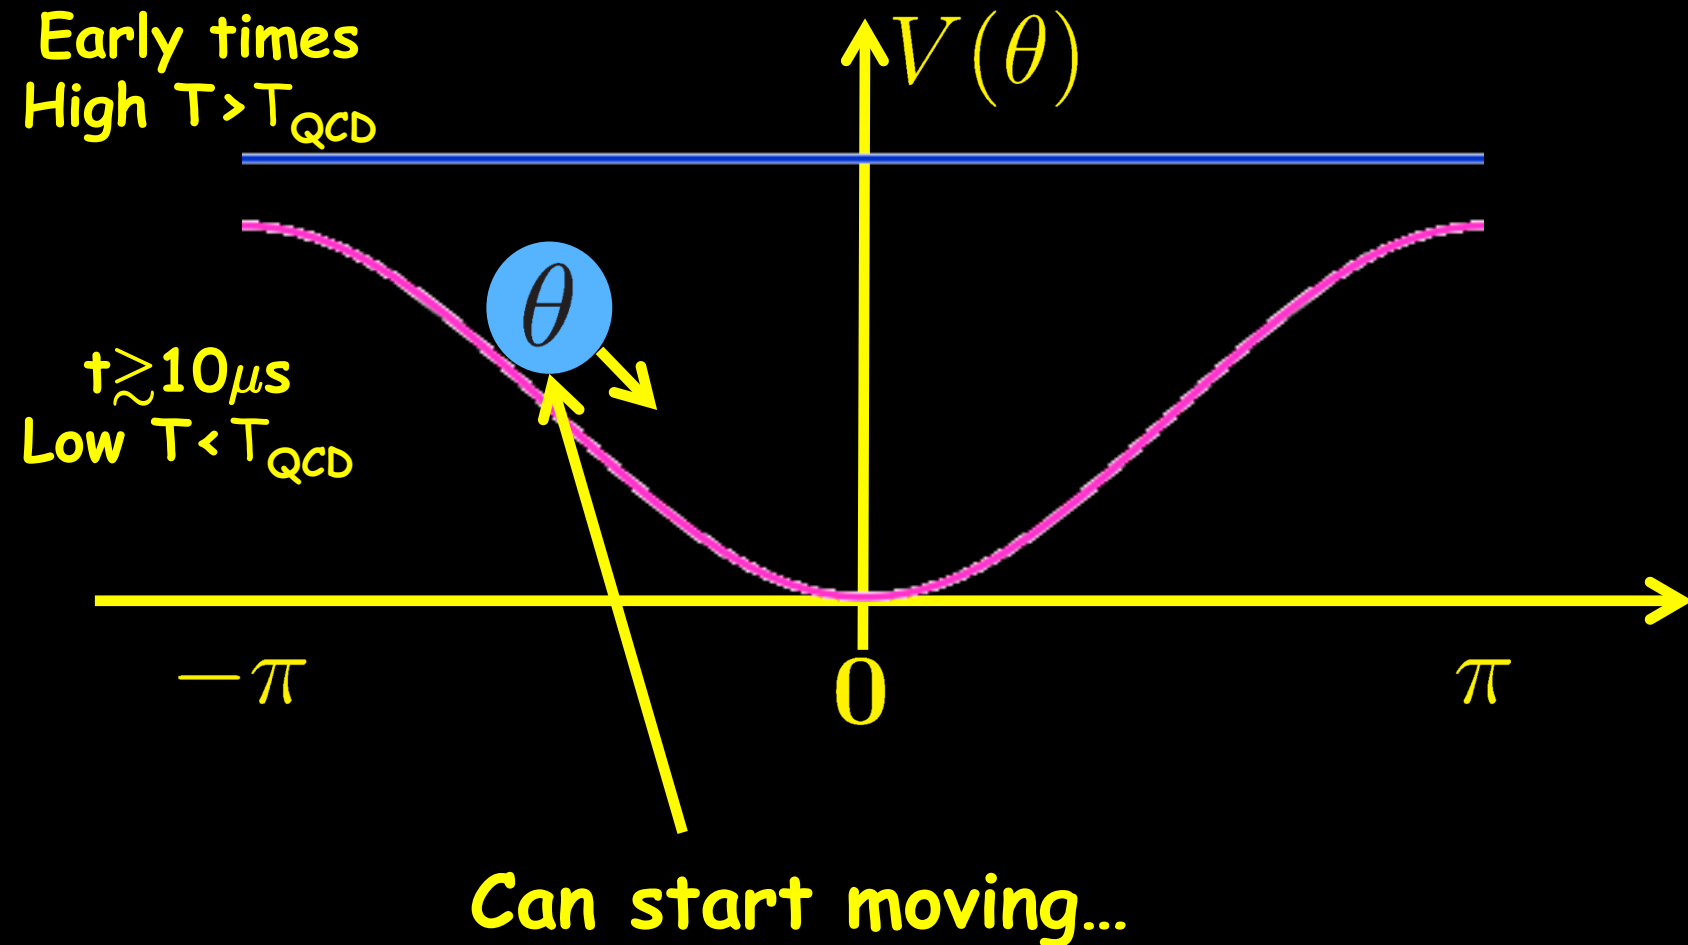

Dark
MYTH BUSTED
keV?

Axion Dark Matter

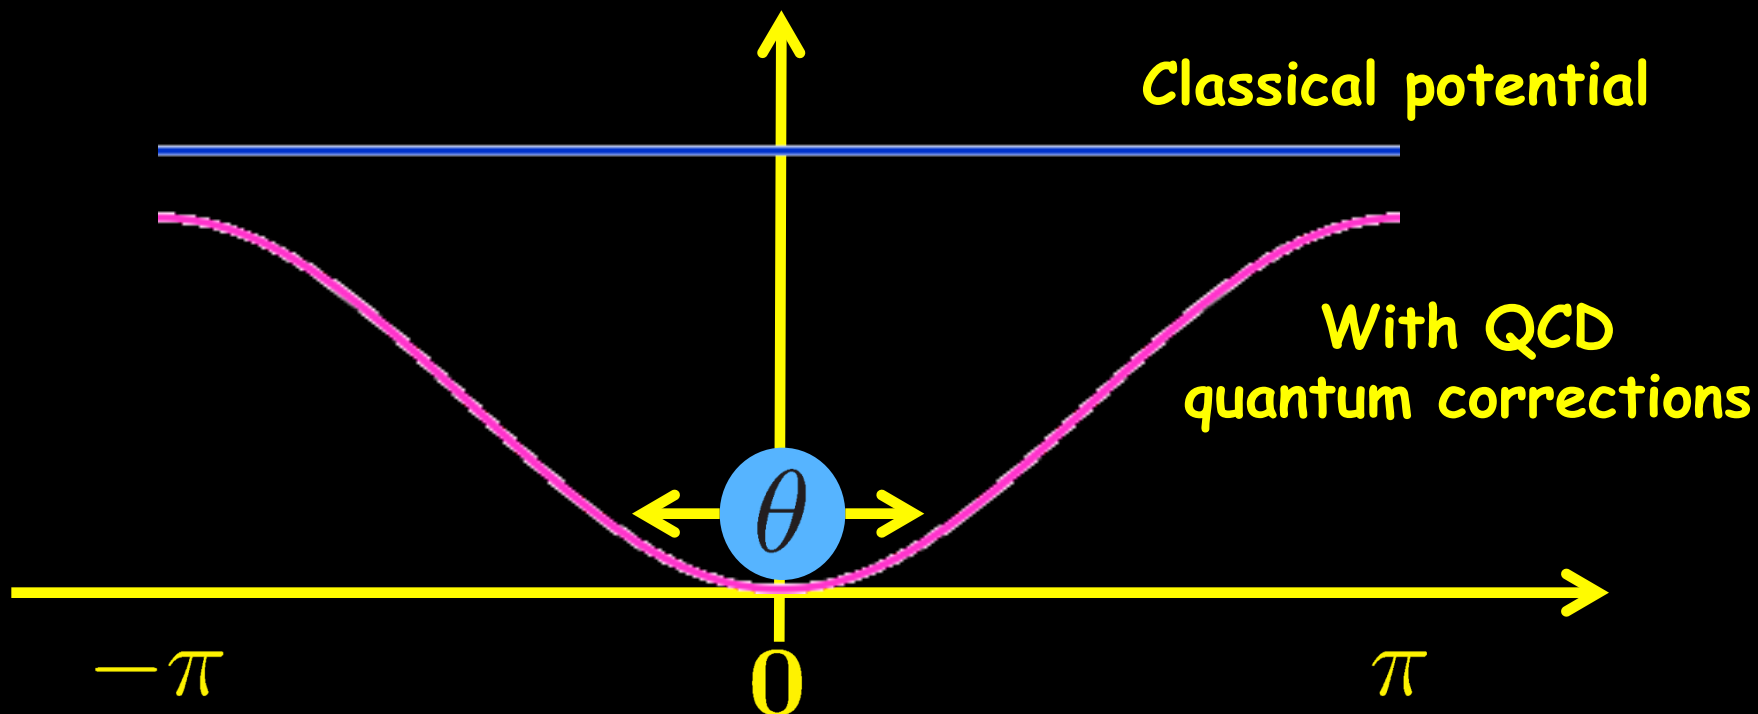

The axion has no clue where to start

The axion has no clue where to start

The axion solution to the strong CP problem

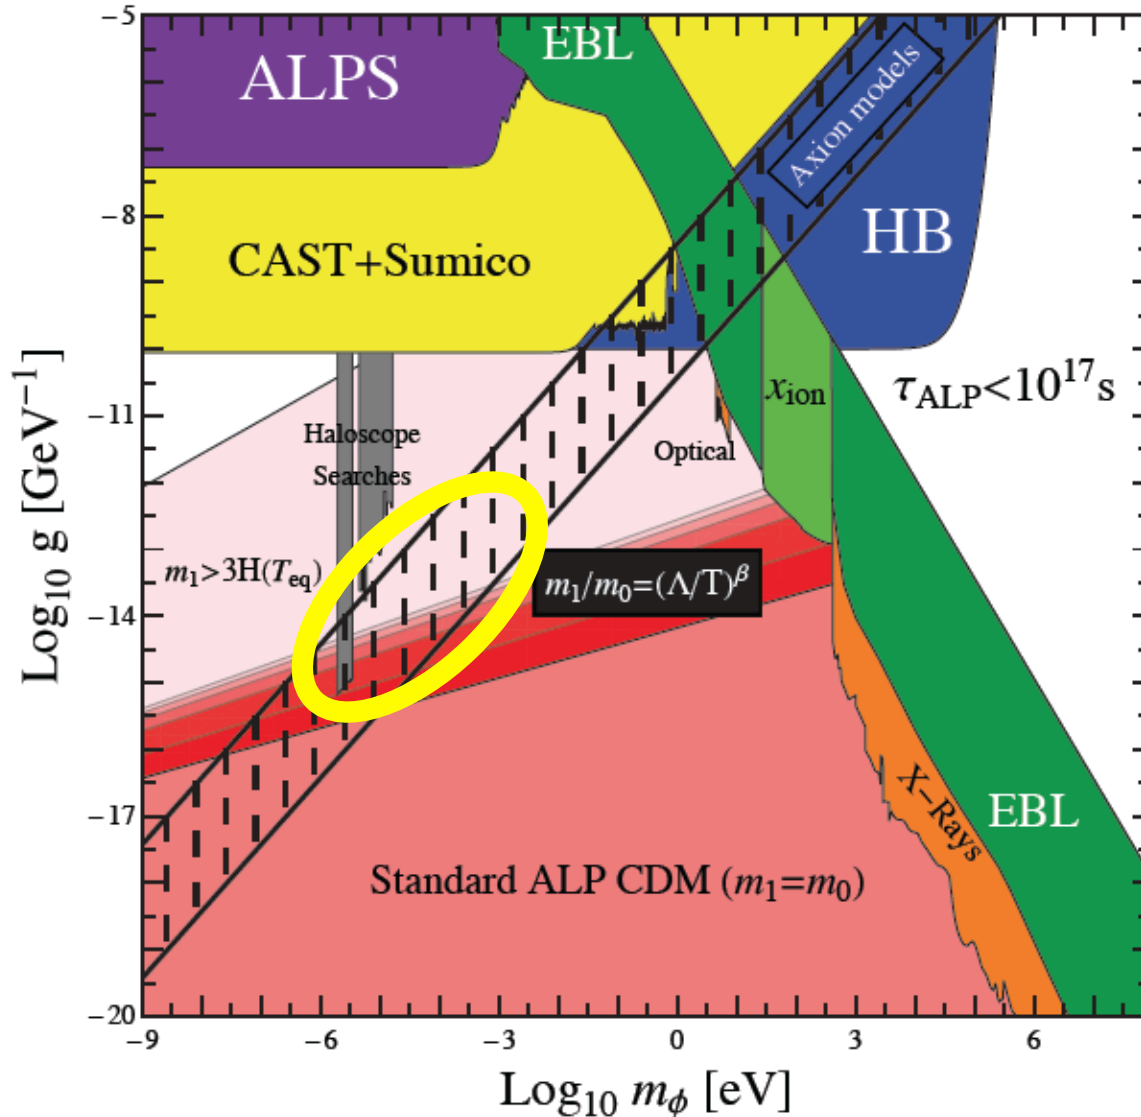

- Oscillations contain energy
- behave like non-relativistic particles ($T=0$)

Axion(-like particle) Dark Matter

$\sim 10^8 \text{ GeV}$

$\sim 10^{12} \text{ GeV}$

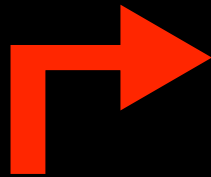

Detecting WISPy
DM

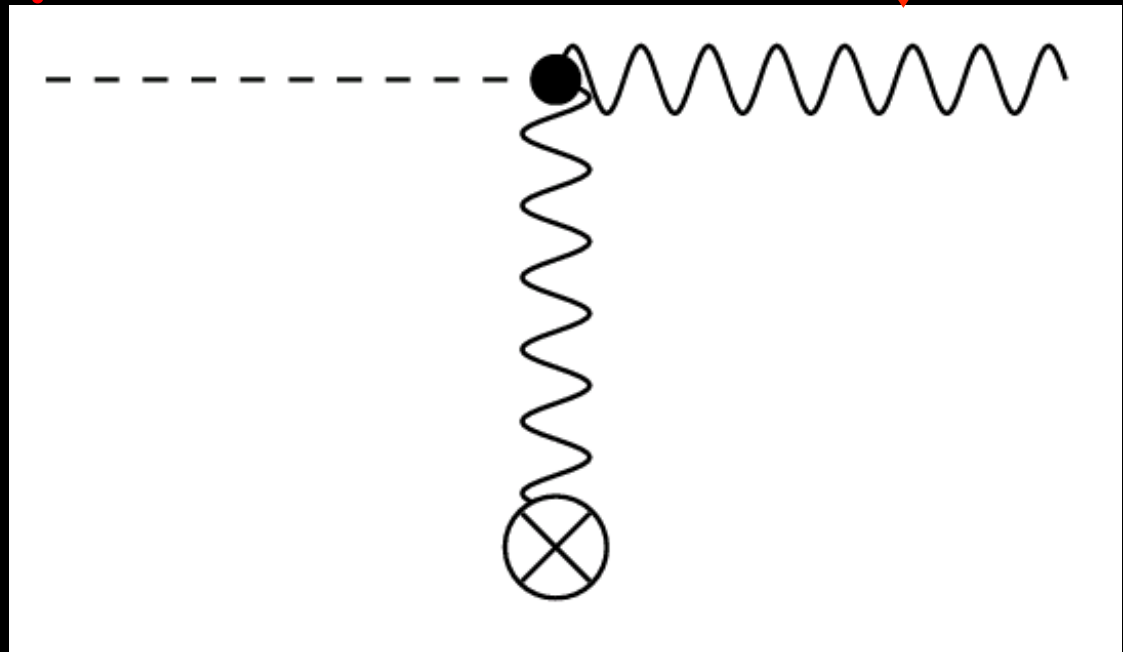

Use a plentiful source of axions

- Photon Regeneration

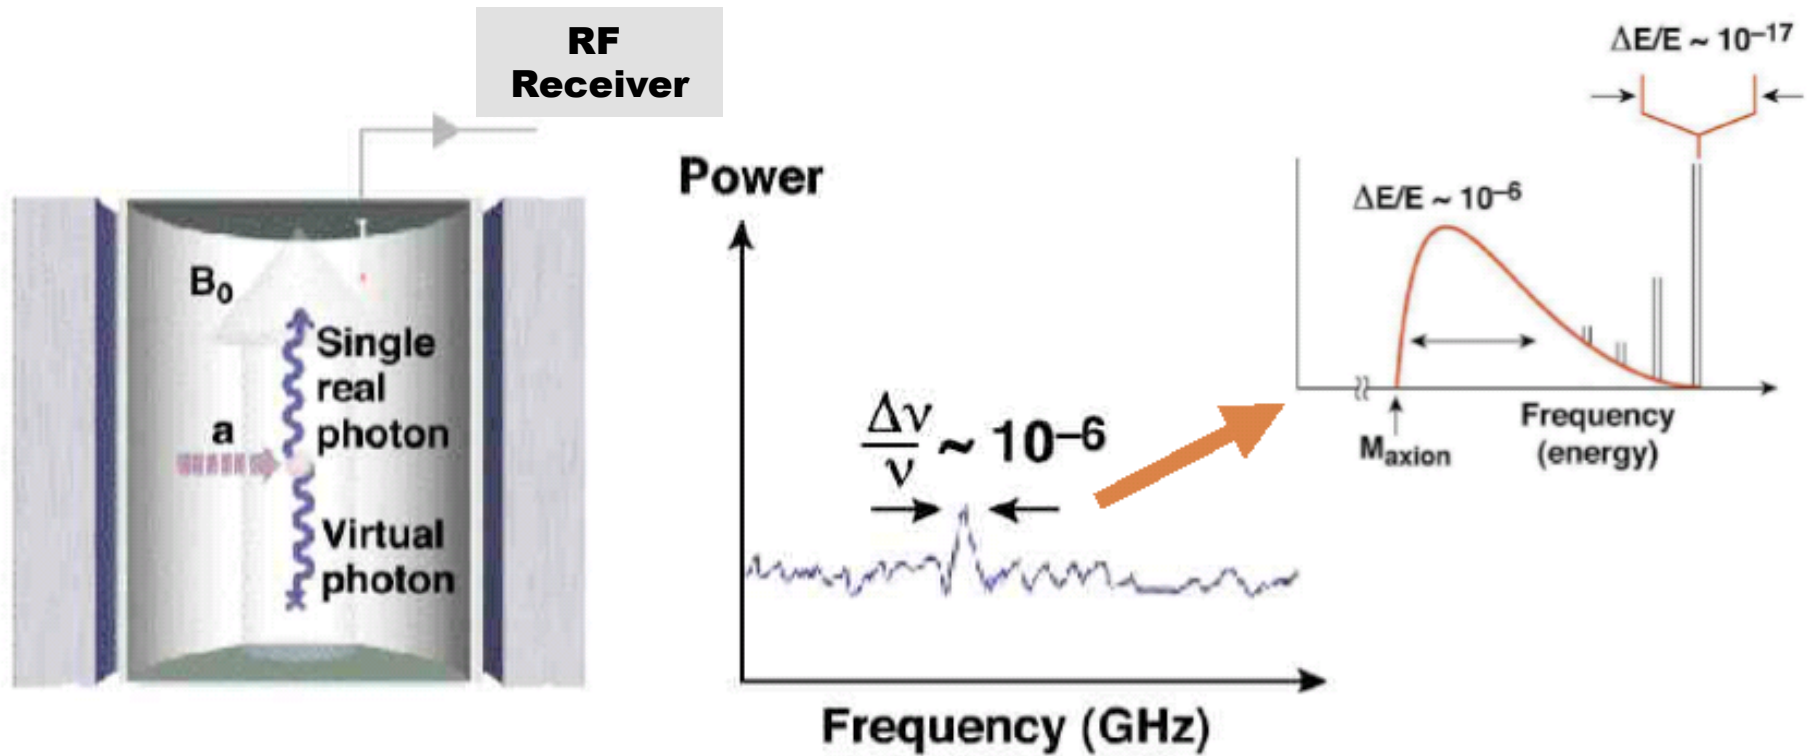

Photon
(amplified in resonator)

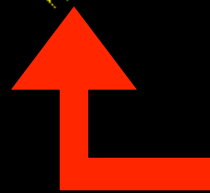

axion
(dark matter)

Signal: Total energy of axion

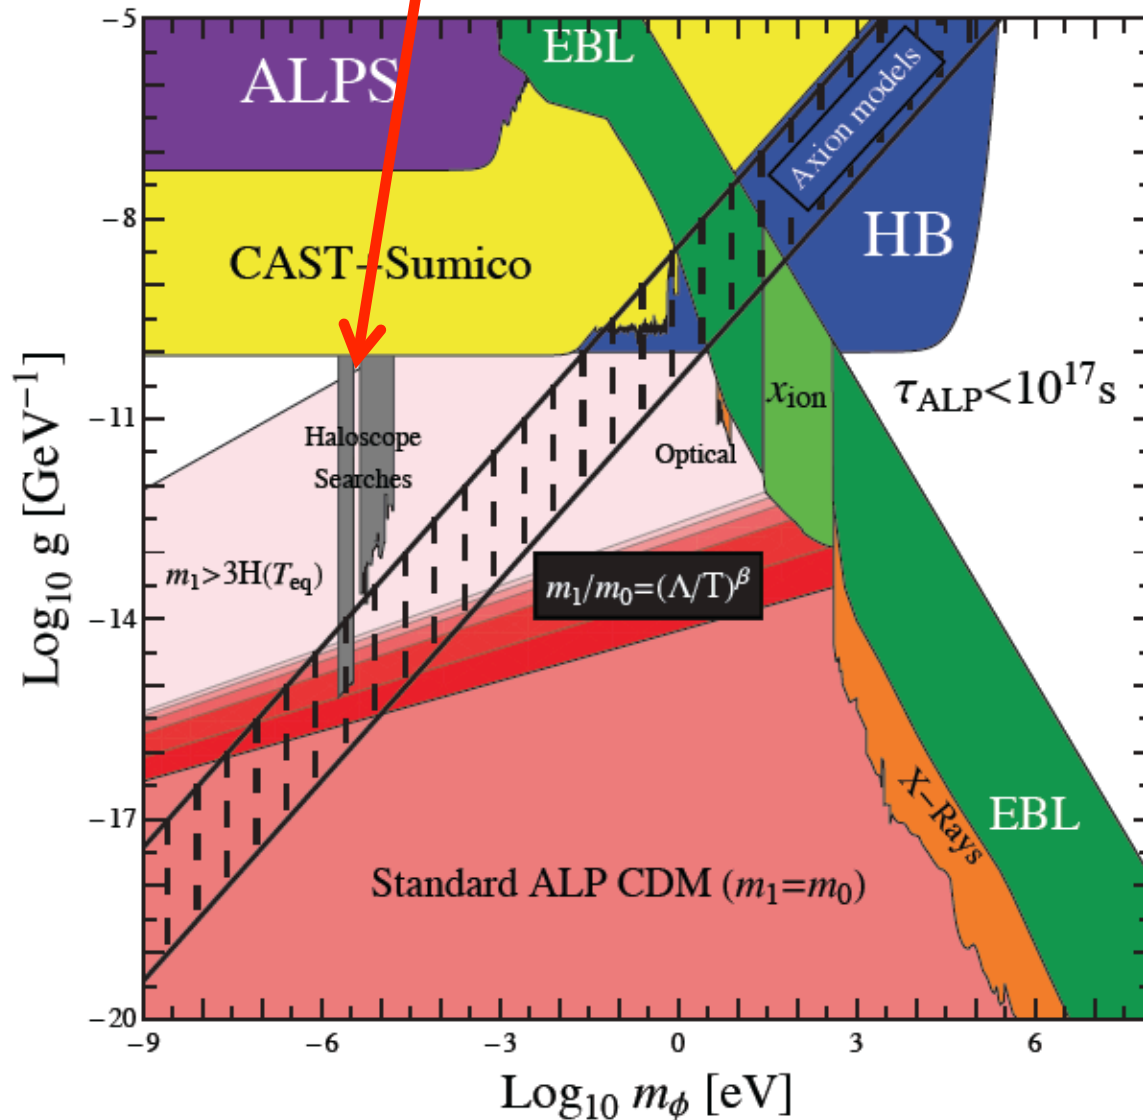

$$h\nu = m_a c^2 [1 + \mathcal{O}(\beta^2 \sim 10^{-6})]$$

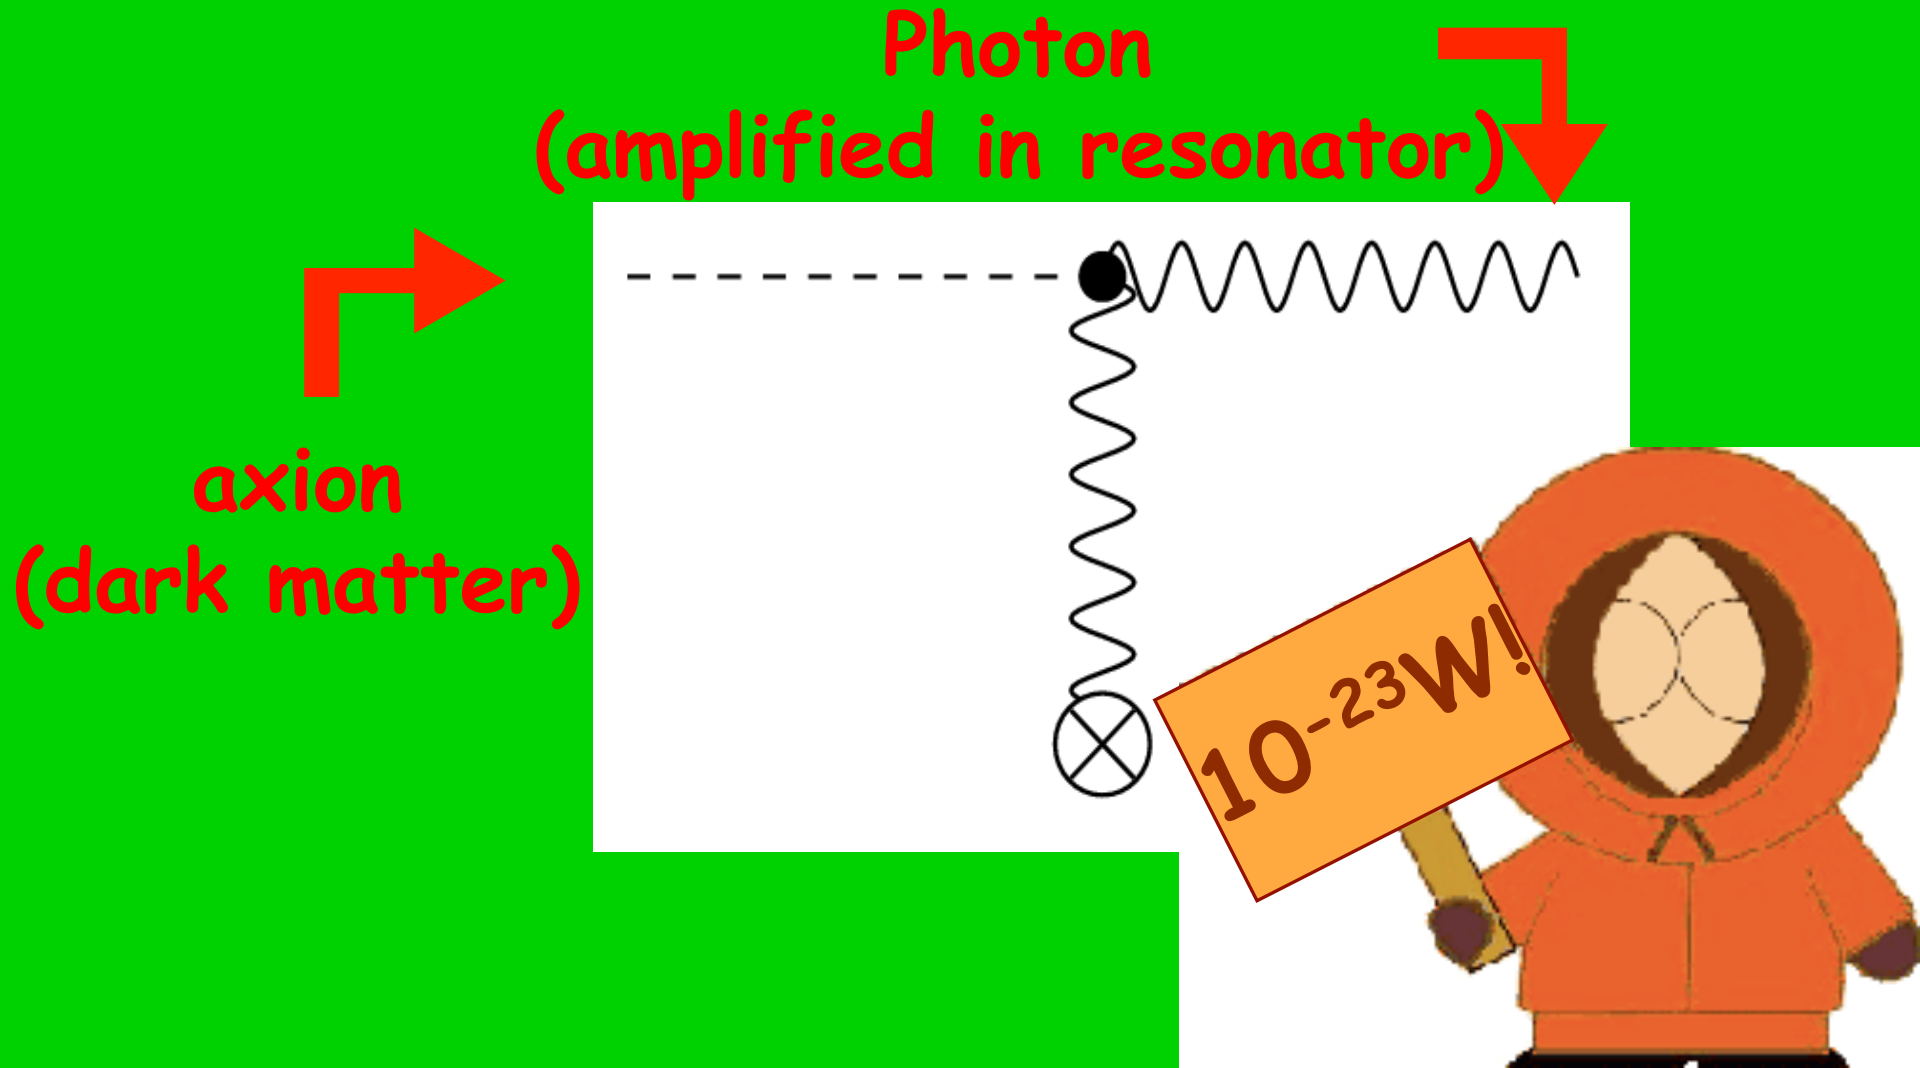

Virial velocity
in galaxy halo!

An extremely sensitive probe!!!

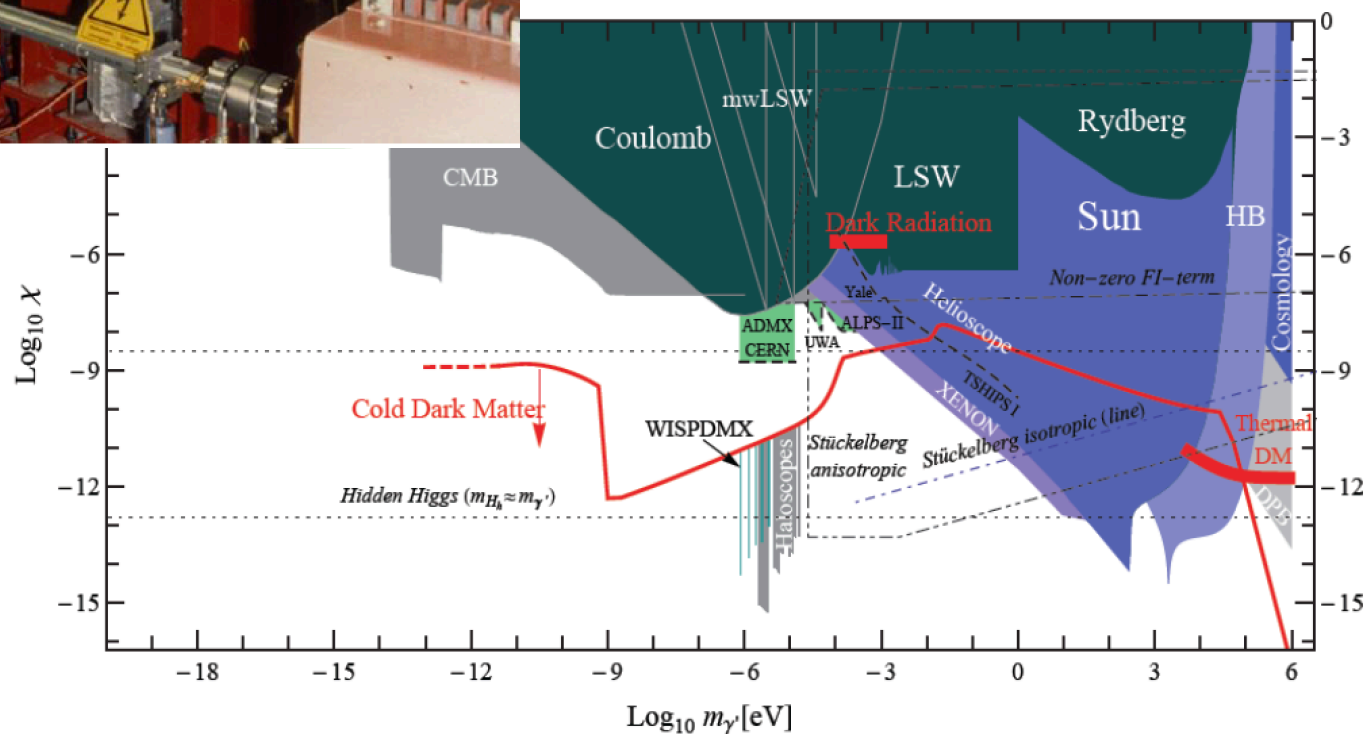

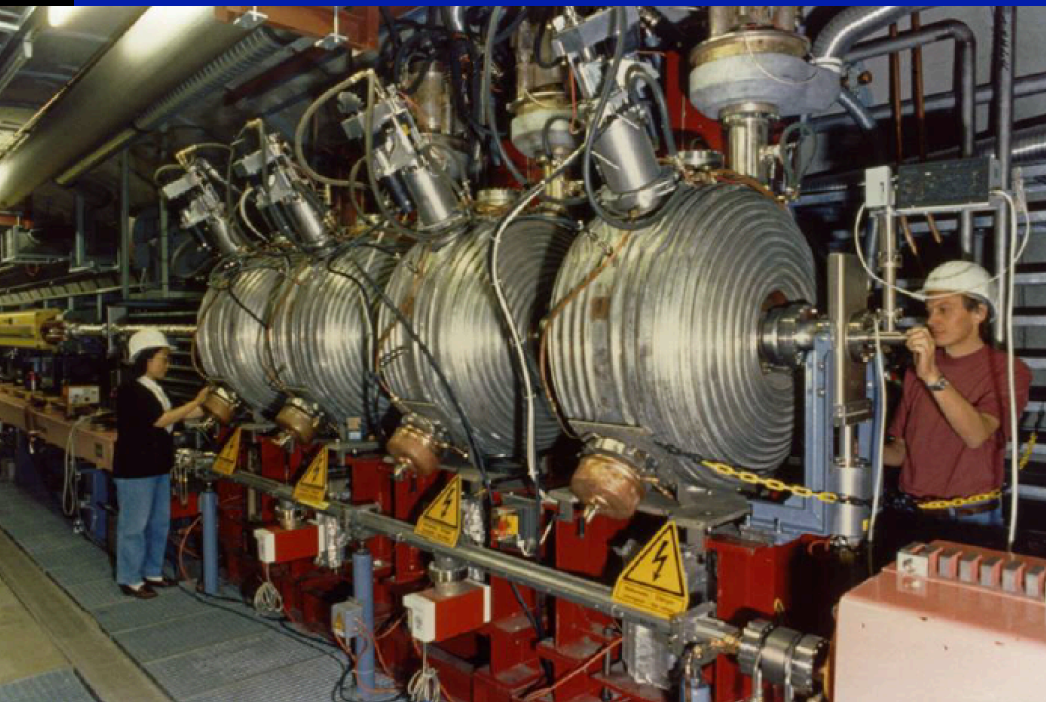

Electricity from Dark Matter :-).

Broadband Search Strategy

Dark Matter Antenna

Probes here;
very sensitive!!

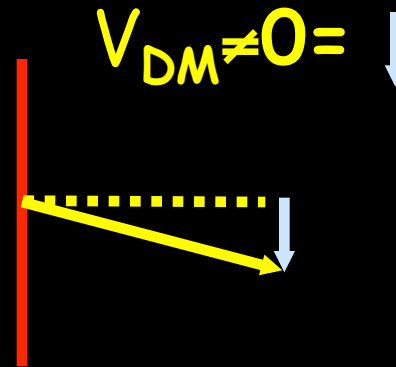

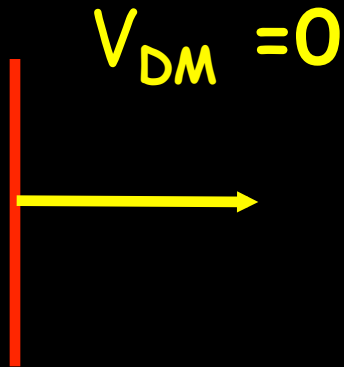

Recycle Auger mirror

A Dream for Astrology ehnm Astronomy

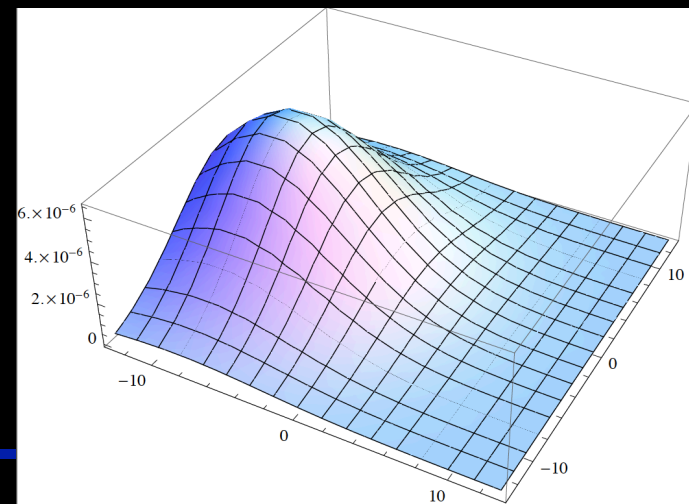

- Emission from moving dark matter

- A picture of the DM-velocity distribution

Screen

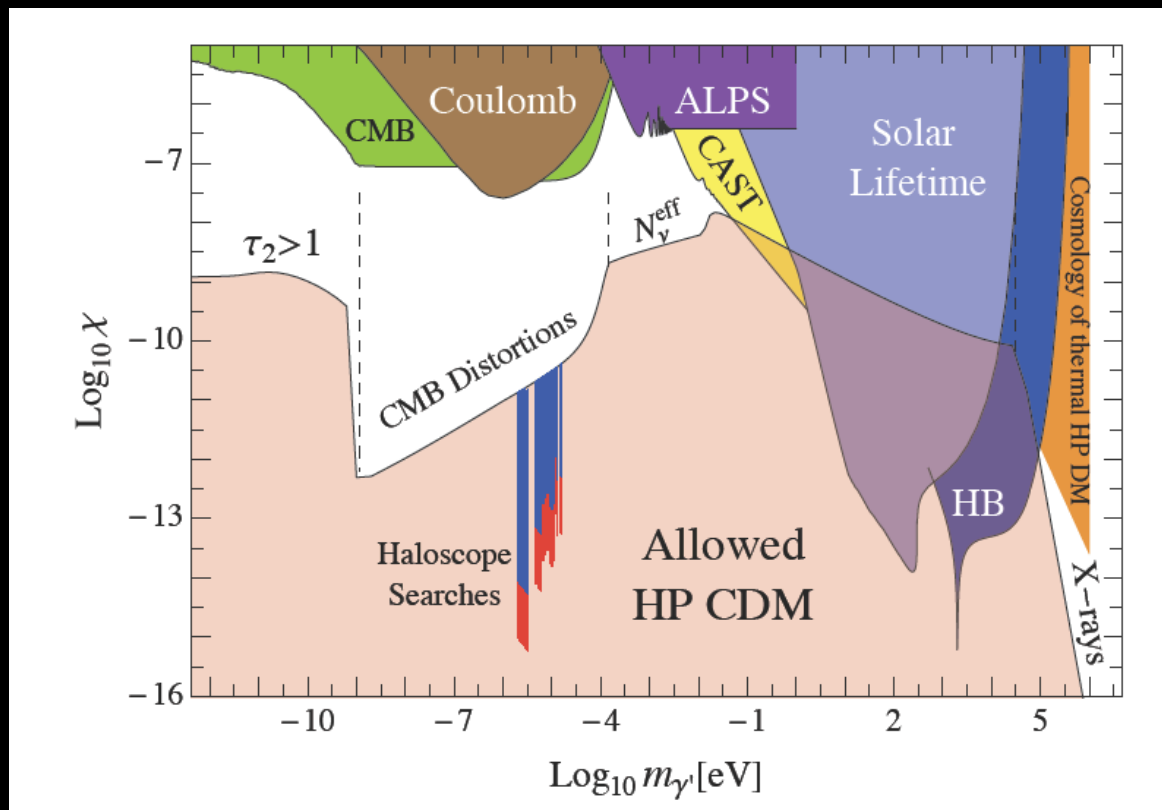

Pre-Final words

Also for hidden photons!!!

- Most things also work for other well motivated light particles.

- E.g

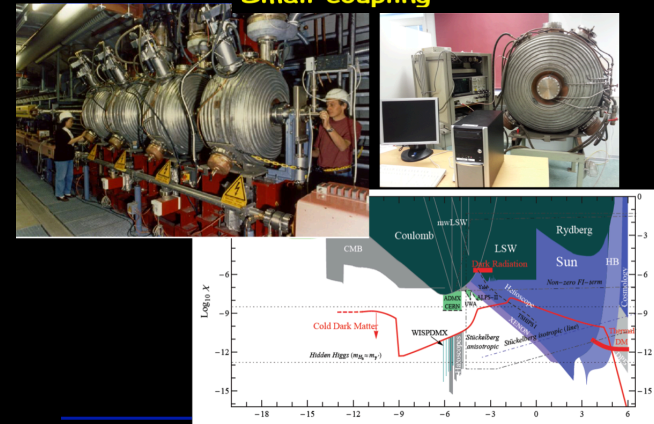

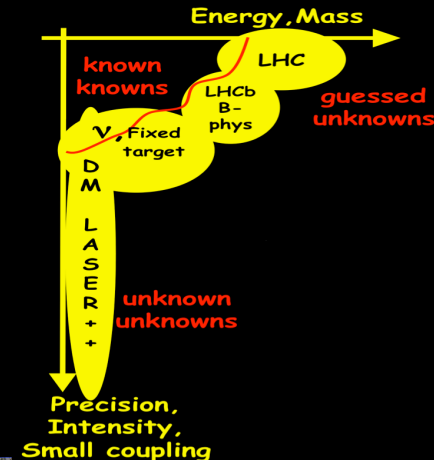

extra (hidden) $U(1)$ bosons=hidden photons!!!

Conclusions

- ➡ explore 'The Low Energy Frontier'

- Dark Matter may be WISPy 😊
 - ➔ New Search opportunities!
 - ➔ Searches ongoing!

Hidden sector

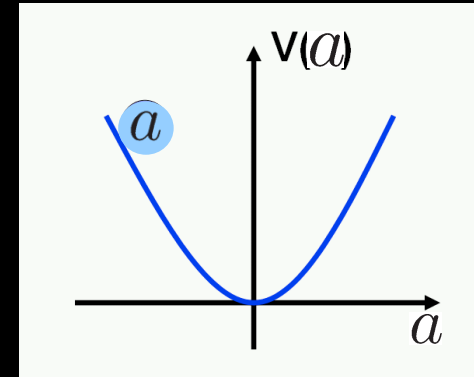

Axion Dark Matter

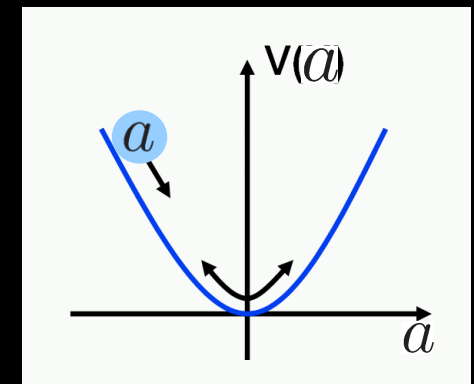

$$\ddot{a} + 3H\dot{a} + m_a^2 a = 0$$

$$H = \frac{\dot{R}(t)}{R(t)}$$

- $H \gg m_a \rightarrow$ overdamped oscillator

- $H \ll m_a \rightarrow$ damped oscillator

$$\rho_a(t) = \frac{\rho_{ini}}{R^3(t)} \rightarrow \text{Dark Matter}$$

Beyond Photon Couplings

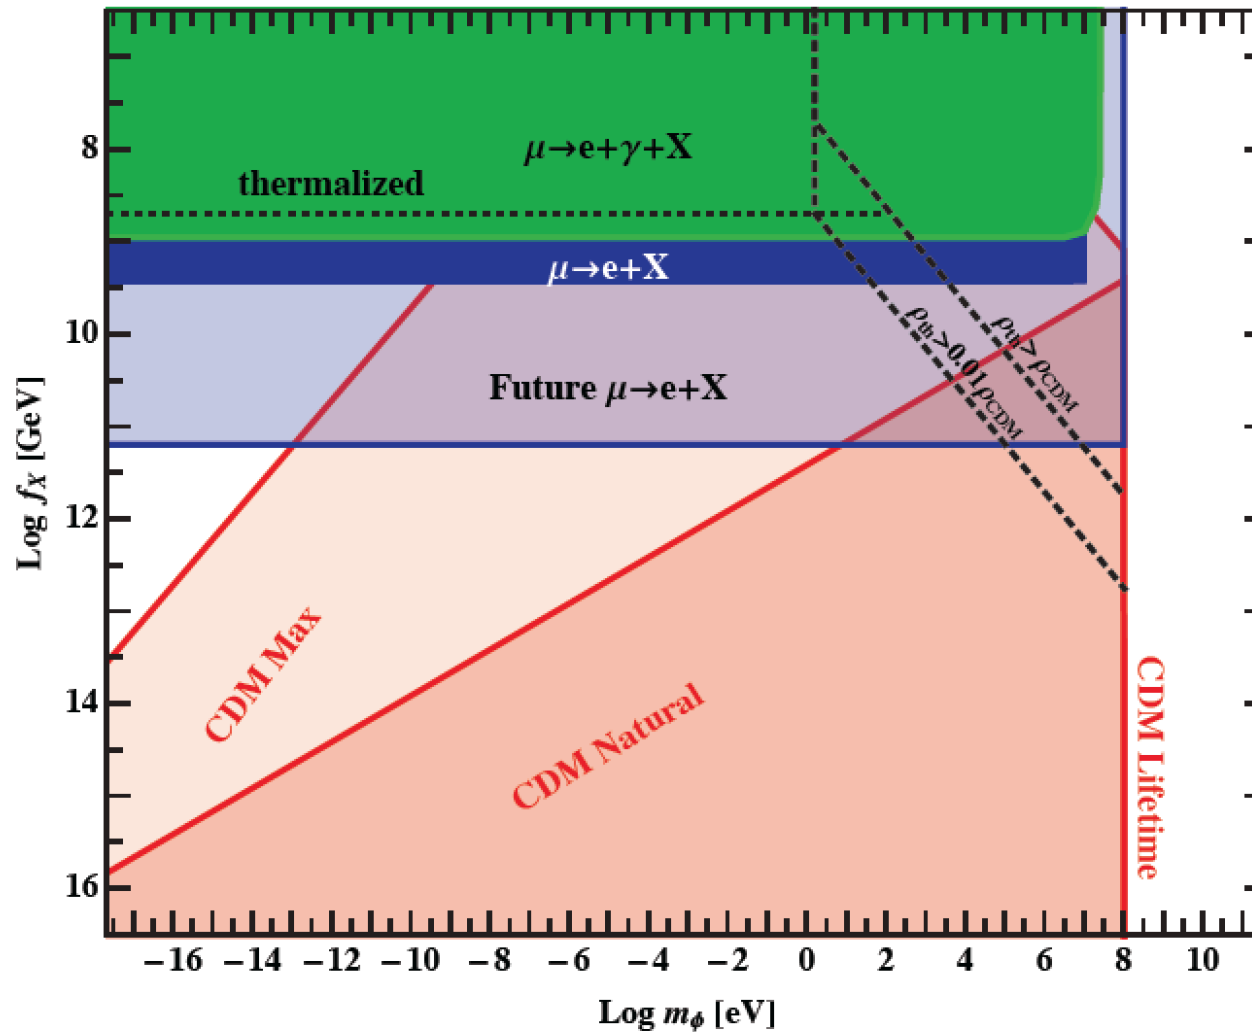

Light bosons can couple to fermions

- Goldstone bosons naturally couple to fermions (charged under the symmetry)
- E.g. Family symmetry changing e into μ

$$(\partial_\mu \phi) \bar{\mu} \gamma^\mu e + h.c.$$

Interestingly these couplings are not very constrained from astrophysics!
(not enough energy to make μ s

Plenty of room for dark matter

Flexing BICEP 2

Axion/ALP DM: Two Scenarios

1) Phase Transition before inflation

Inflation ensures:

same initial field value everywhere

→ Can choose this value

→ Tune to right DM density (always poss.)

But quantum fluctuations from inflation

→ Isocurvature fluctuations $\sim H_I$

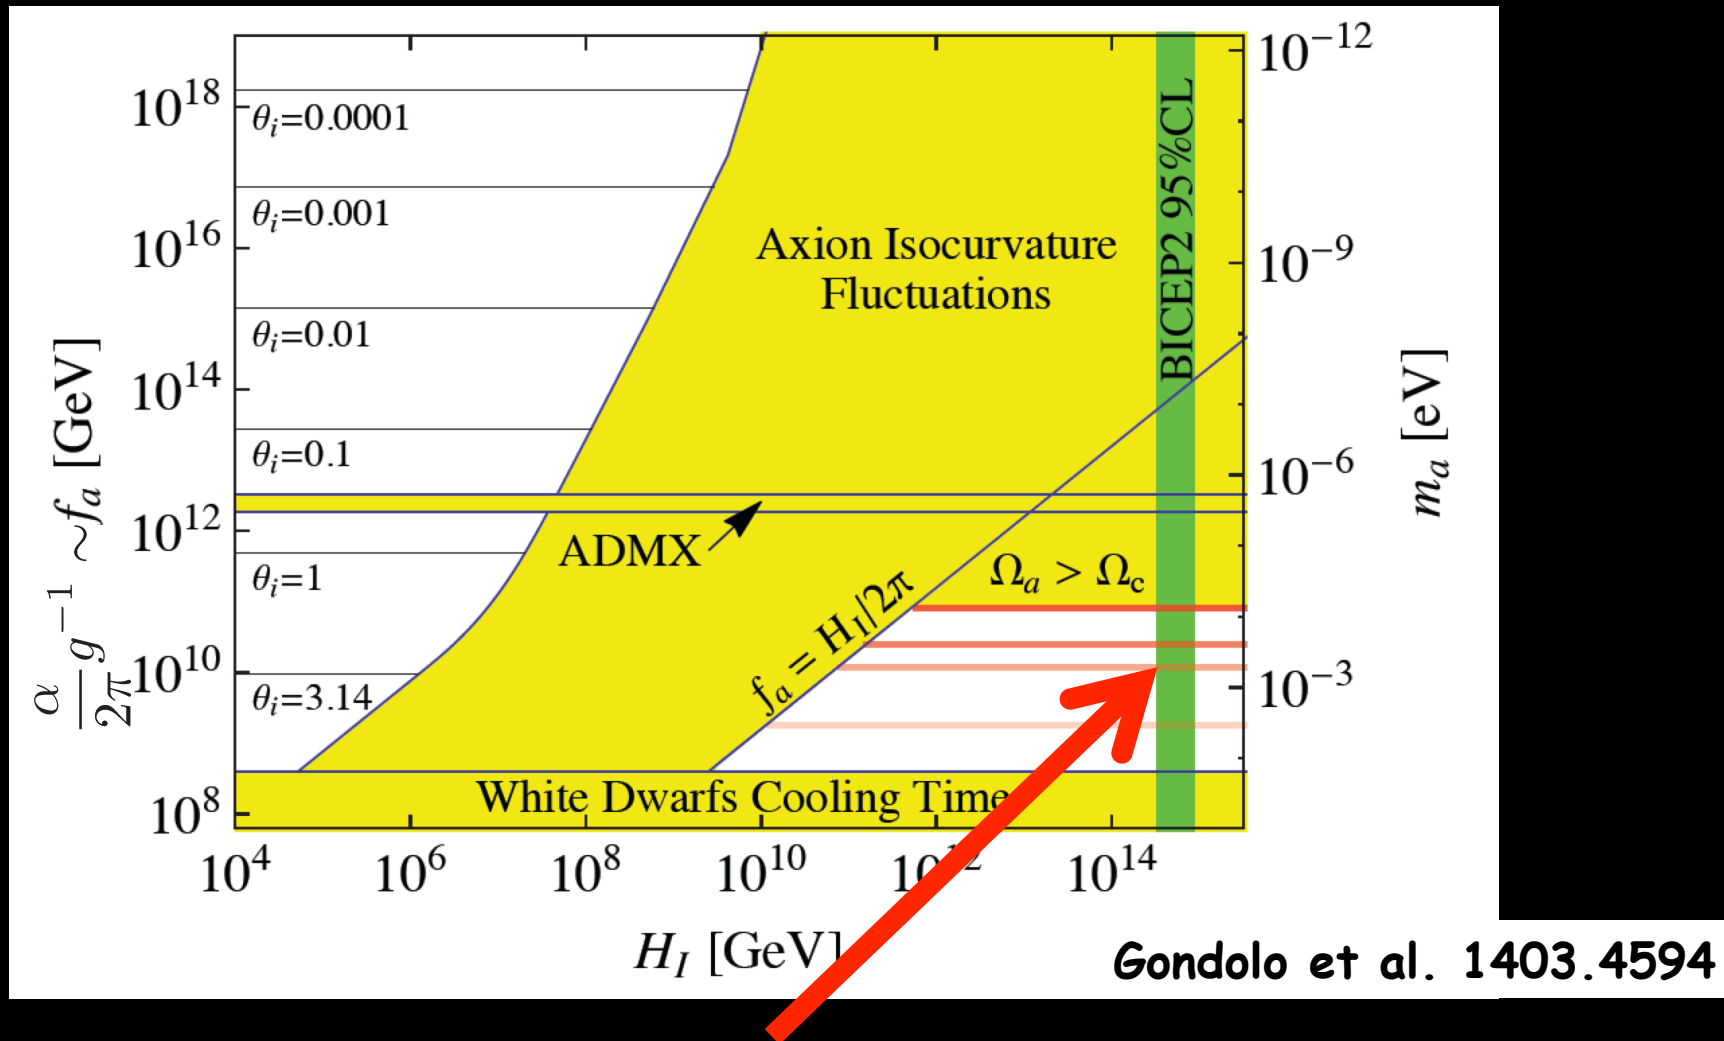

2) Phase Transition after inflation

average over initial field values

→ Predict DM density (correct only for specific mass/coup.)

→ No isocurvature fluctuations

What is allowed?

Preferred range!

Two.5 comments

- 1) Similar behavior for other ALPs/WISPs
 - 2) Can be circumvented by non-trivial couplings to gravity.
- 2.5) Needs to be confirmed
-
