Doublet solution

Straight: 175 m, maximum scallop angle: 12 mrad

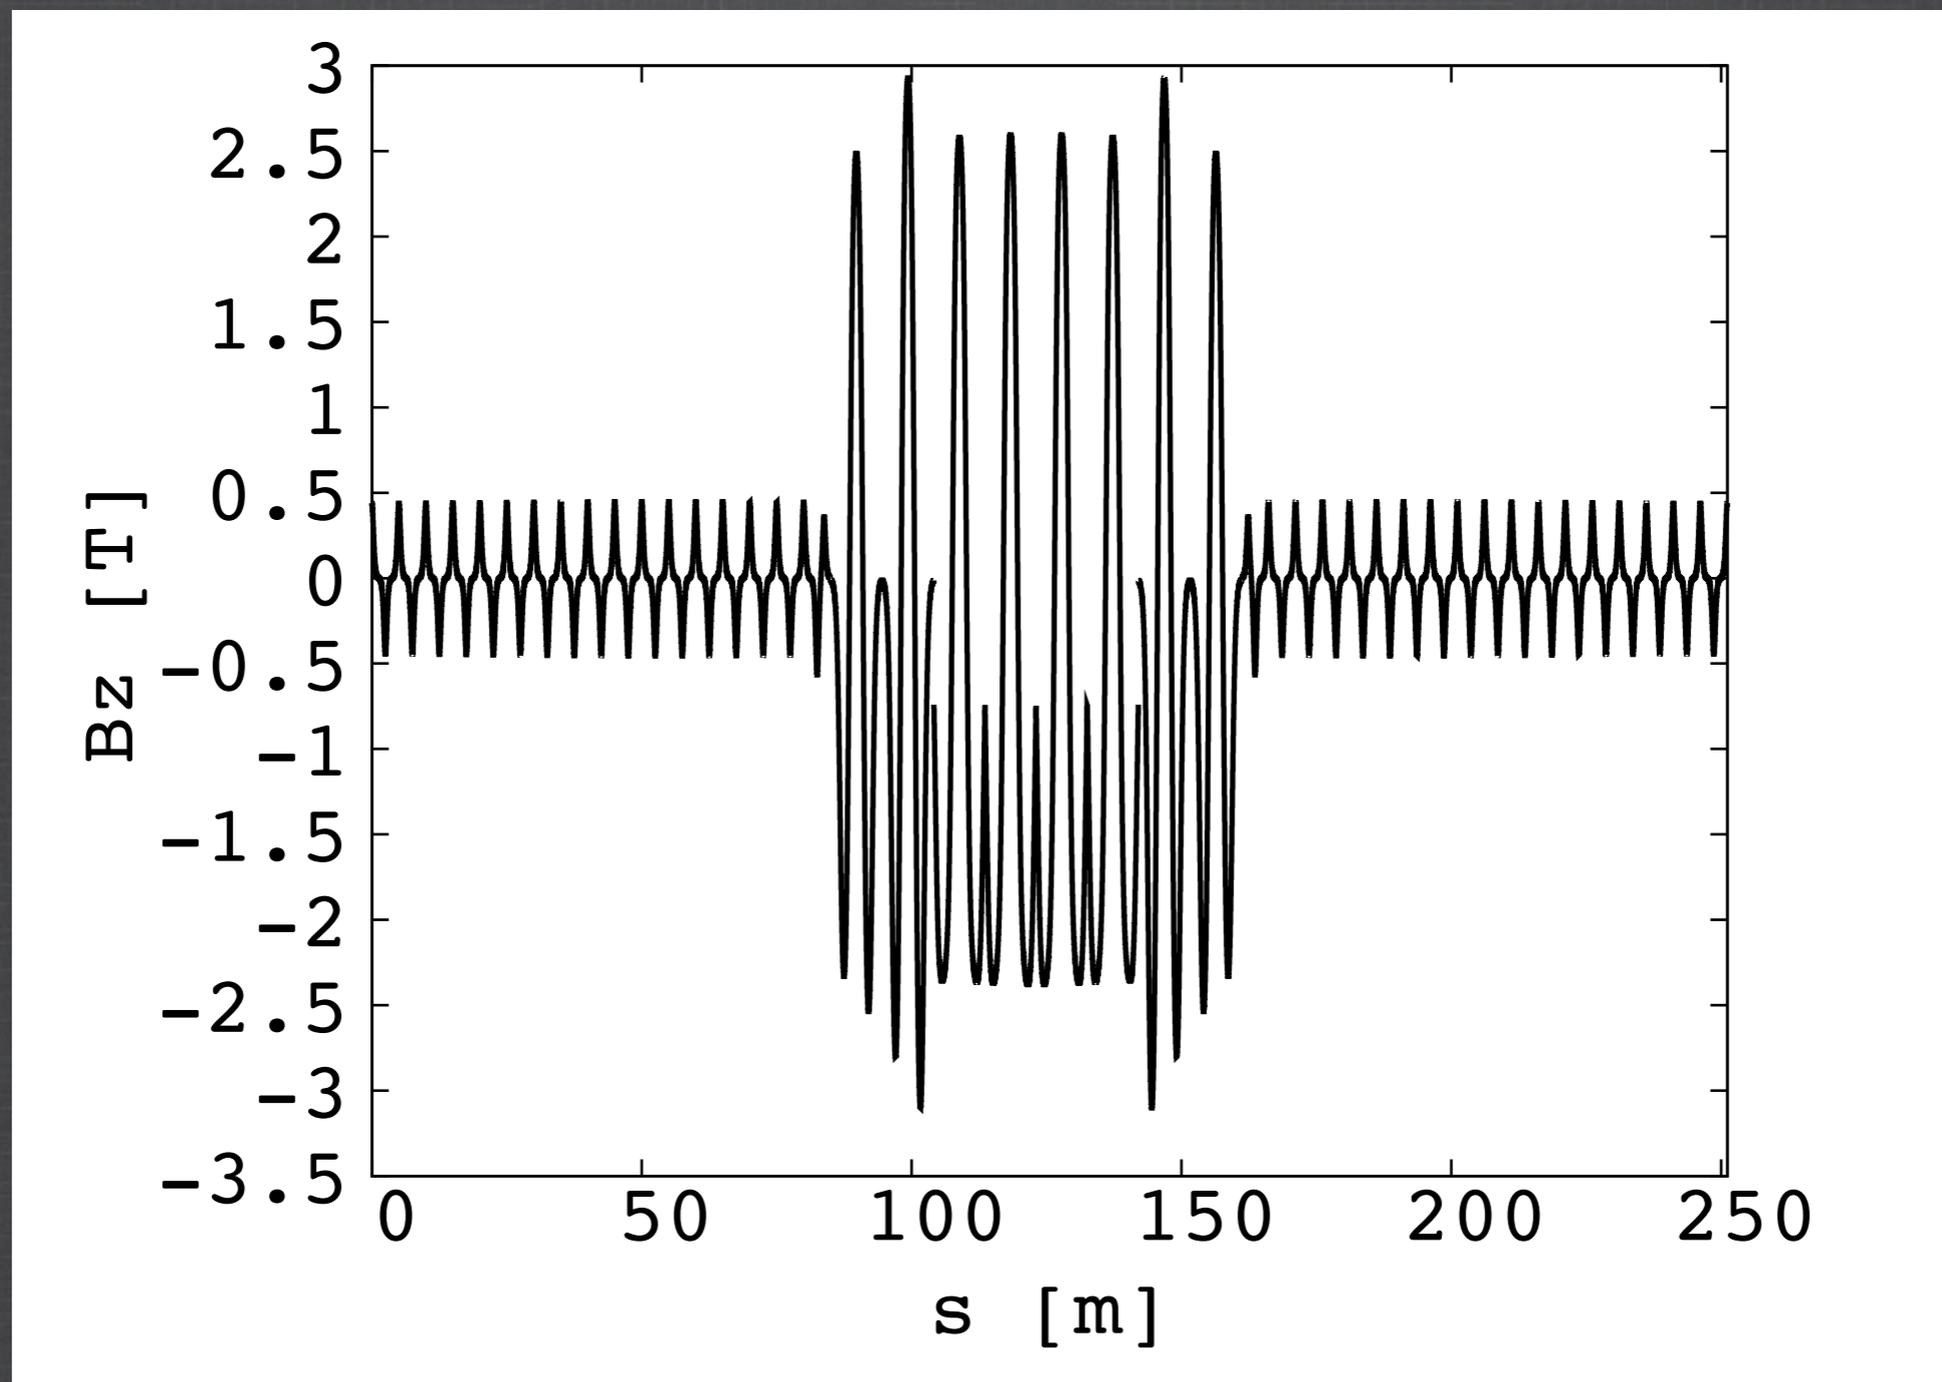

Doublet solution

Cell parameters

	Circular Section	Matching Section	Straight Section
Type	FDF	FDF	Doublet
Cell radius/length [m]	17.6	36.2	5
Opening angle [deg]	30	15	
k-value/m-value	6.043	25.929	5.5 m ⁻¹
Packing factor	0.92	0.58	0.16
Maximum magnetic field [T]	2.5	3.3	1.5
horizontal excursion [m]	1.3	1.1	0.4
Full gap height [m]	0.45	0.45	0.45
Average dispersion /cell [m]	2.5	1.3	0.18
Number of cells /ring	4 × 2	4 × 2	35 × 2

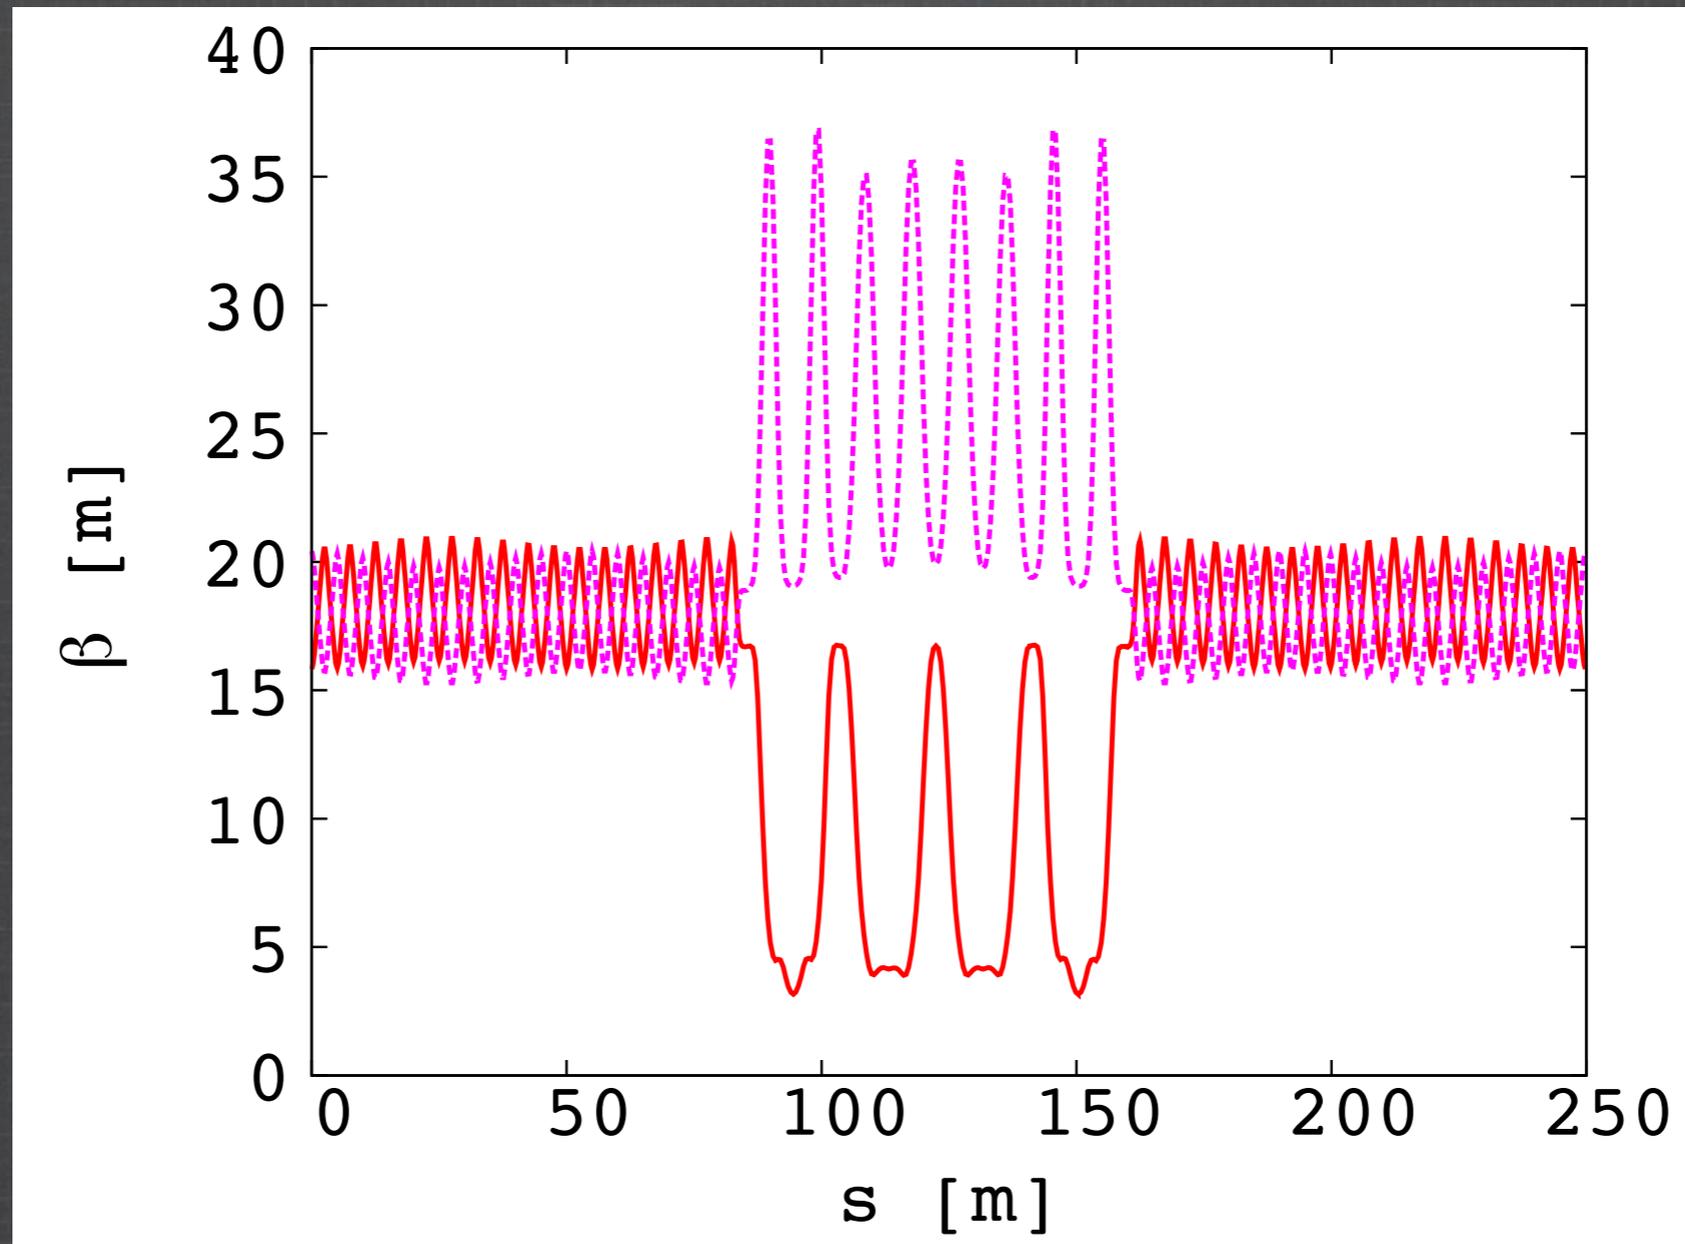

Doublet solution

Magnetic field for P_{\max} (+16%)

Doublet solution

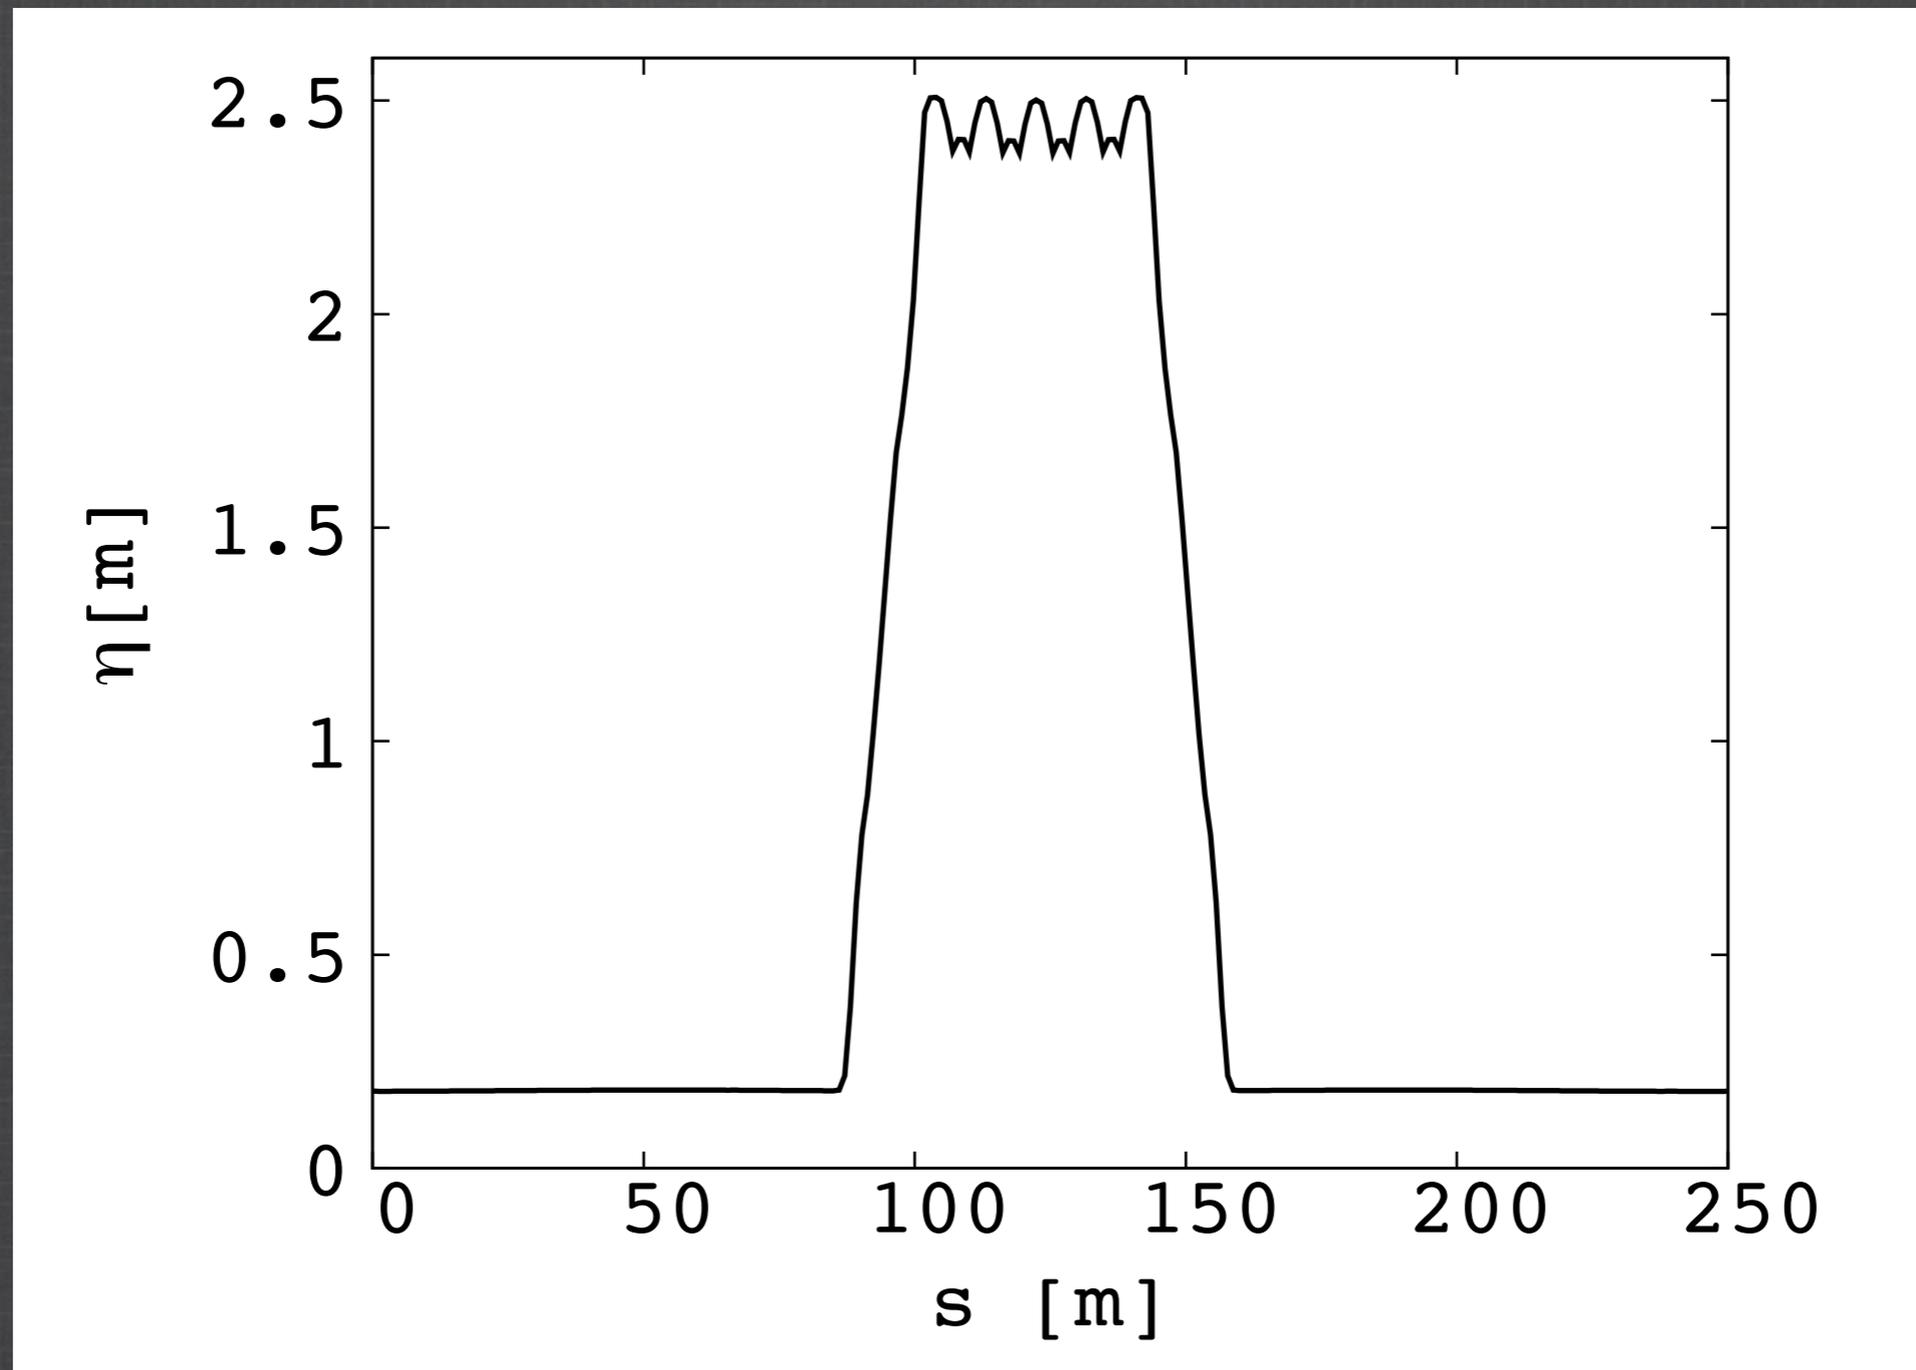

Beta-functions at matching momentum

Horizontal (plain red) and vertical (dotted purple) betafunctions for half of the ring.

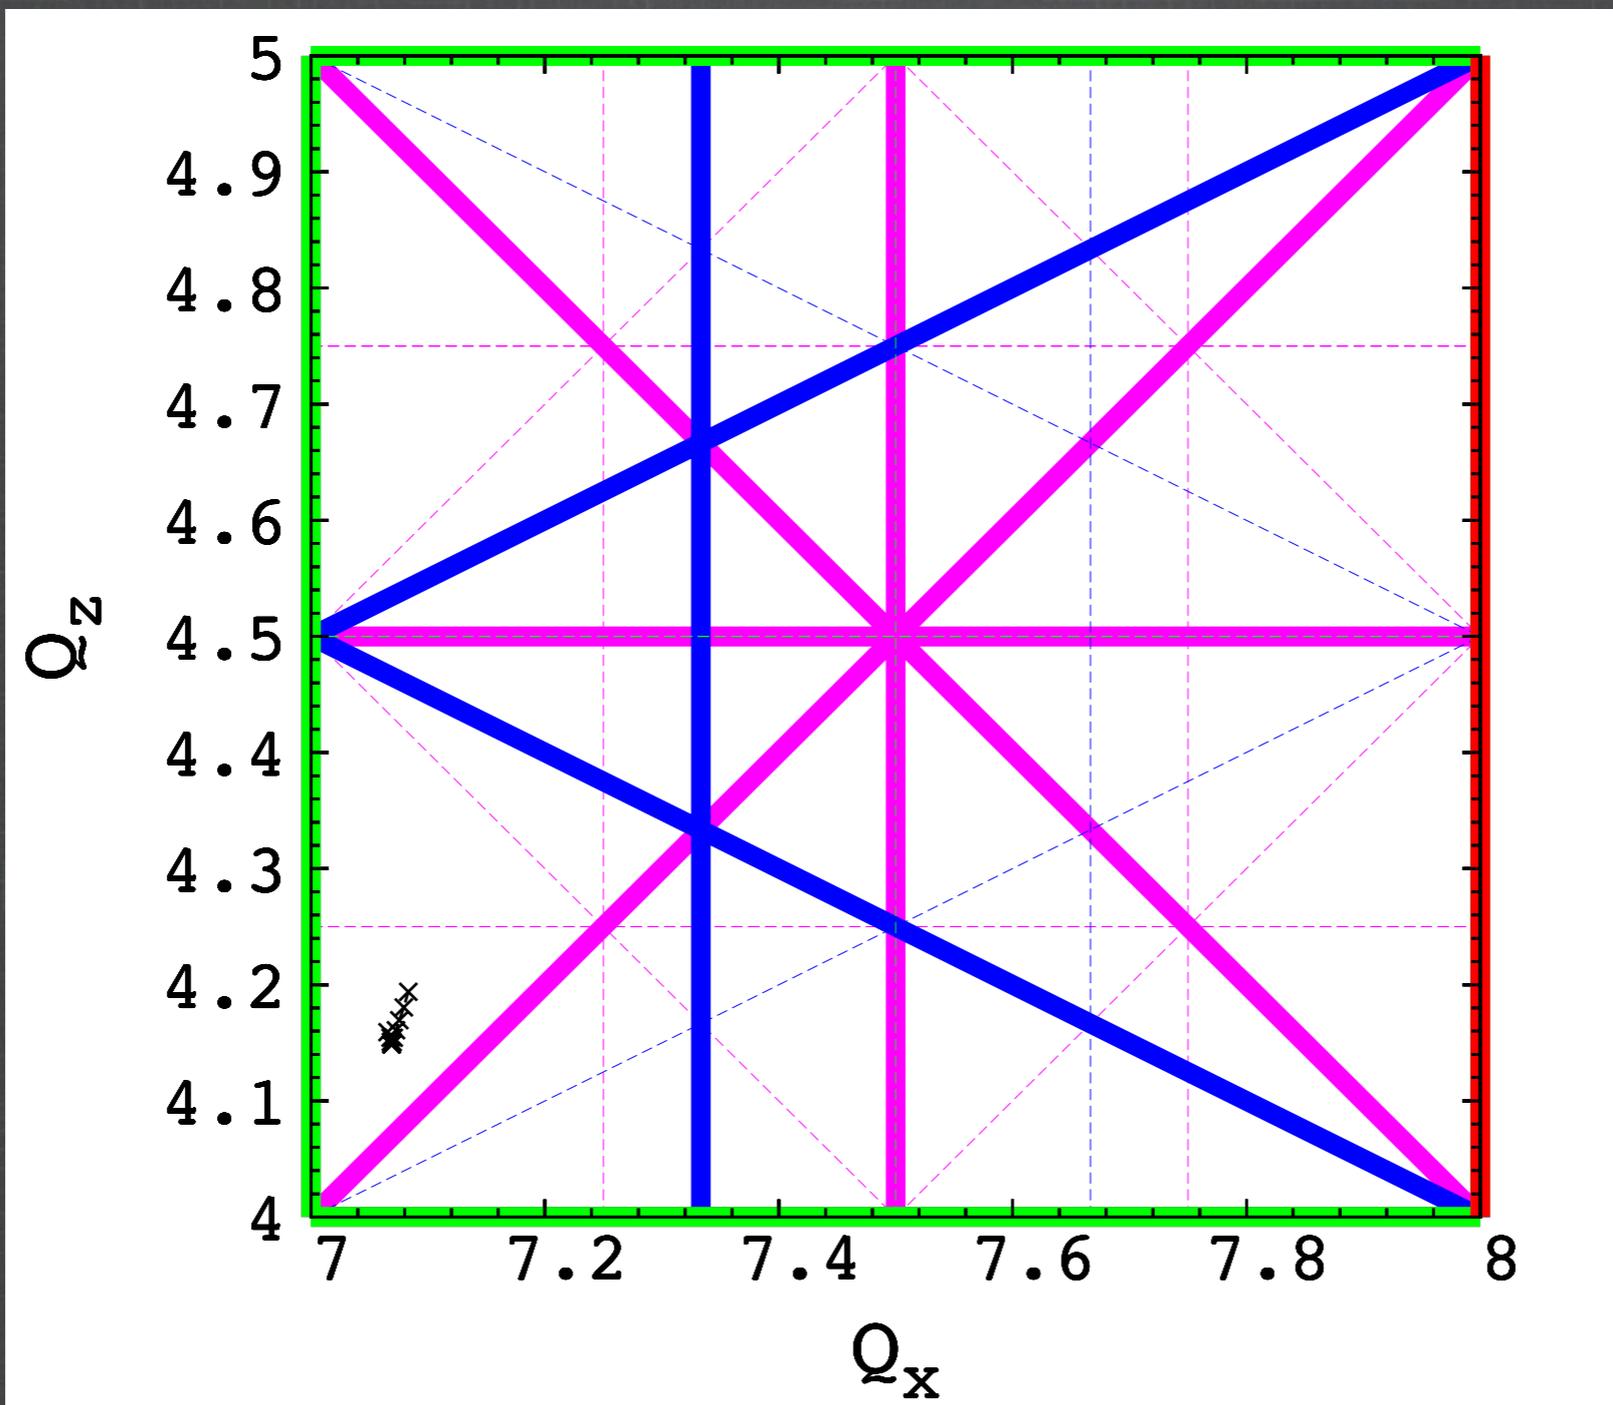

Doublet solution

Dispersion function at matching momentum

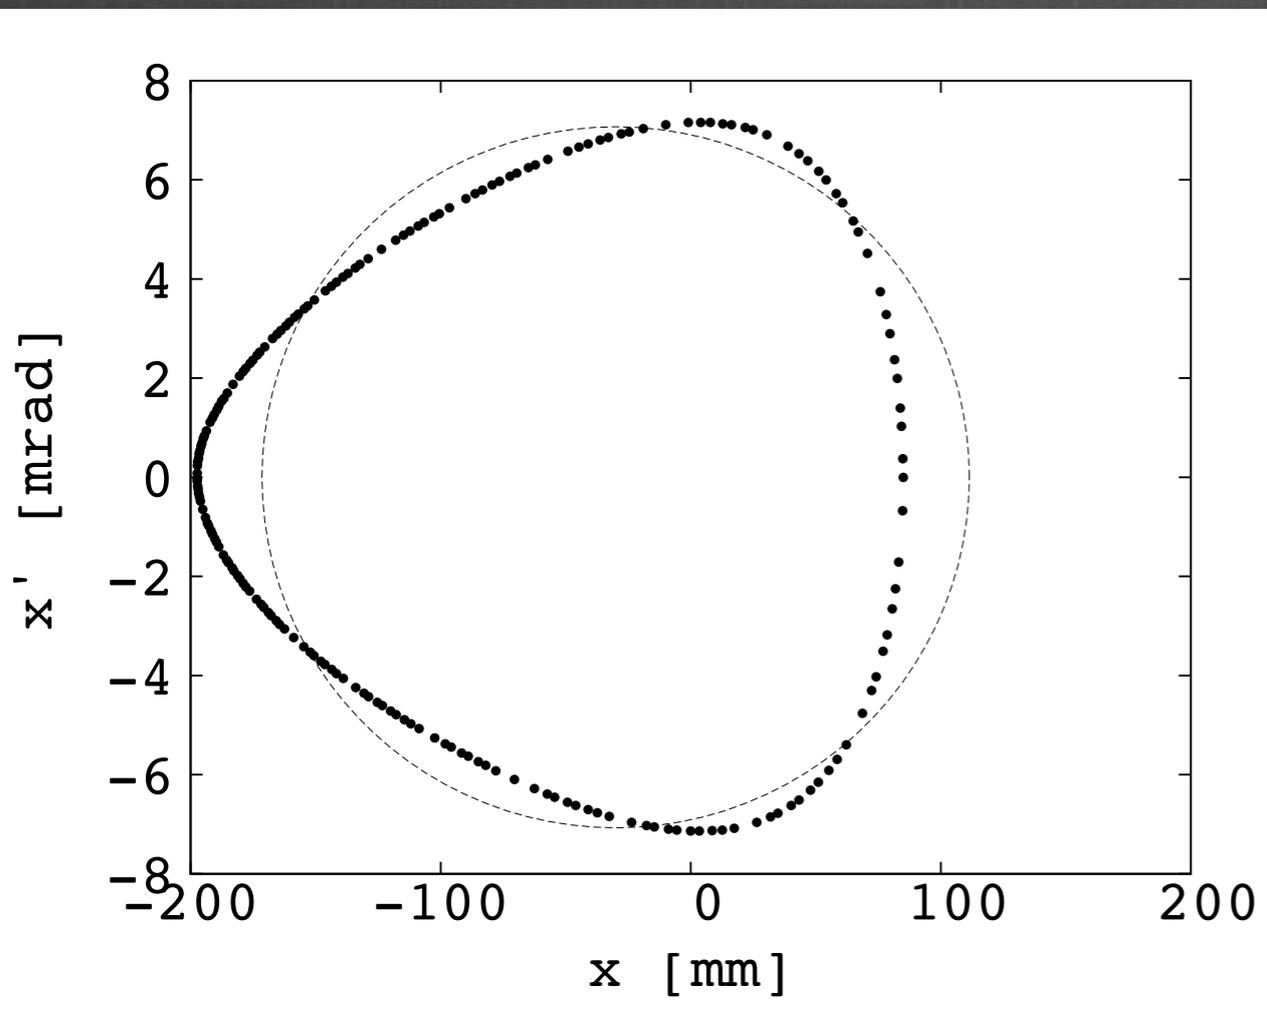

Doublet solution

Tune diagram $\frac{\Delta P}{P} = \pm 16\%$

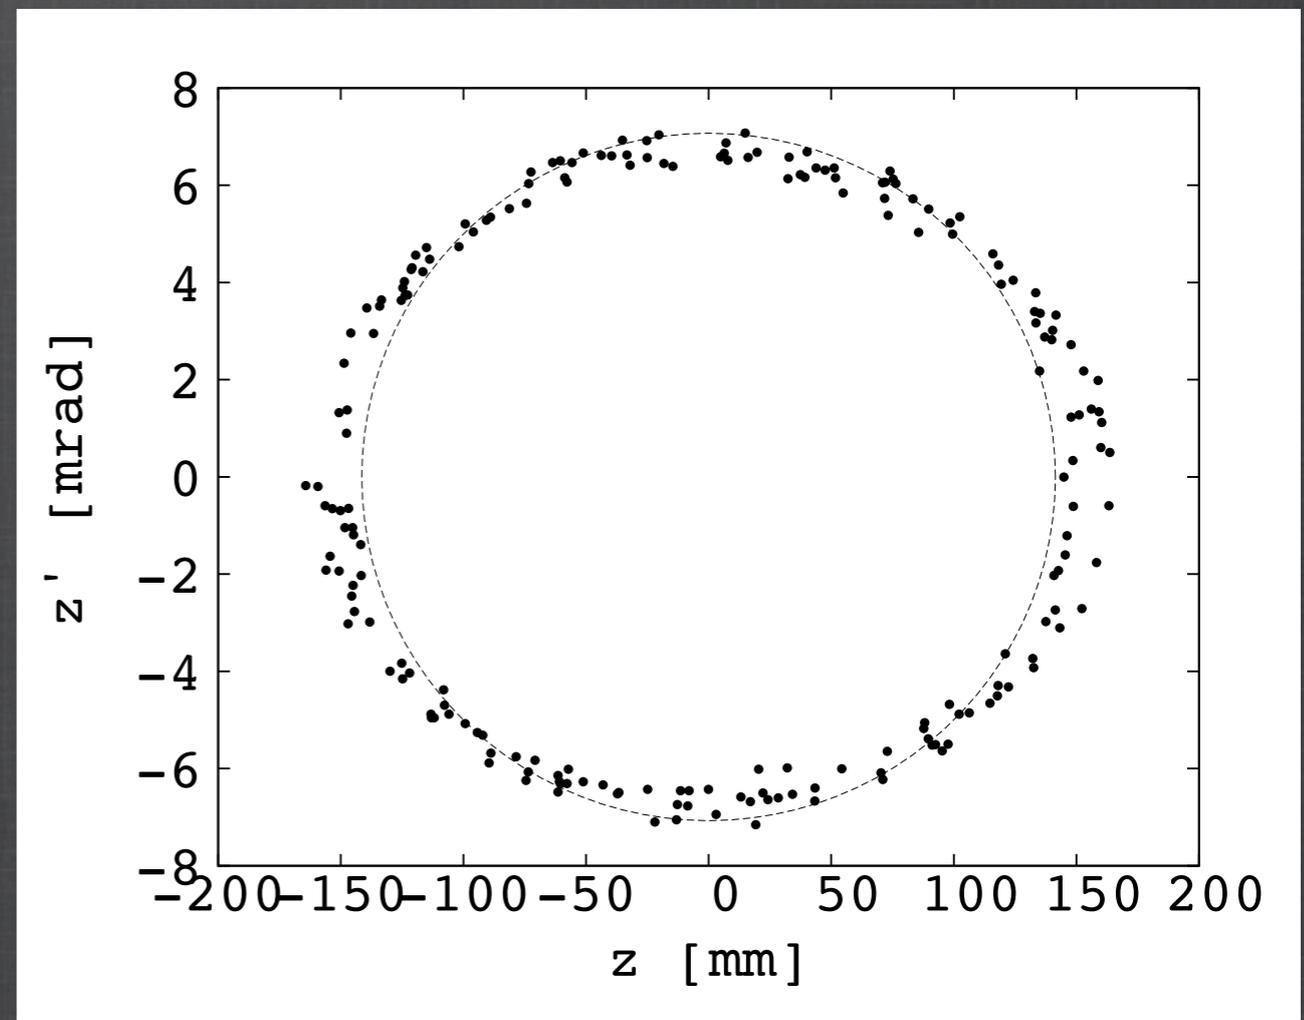

Doublet solution

Transverse acceptance

Maximum horizontal stable amplitude over 100 turns

Maximum vertical stable amplitude over 100 turns

Motivations

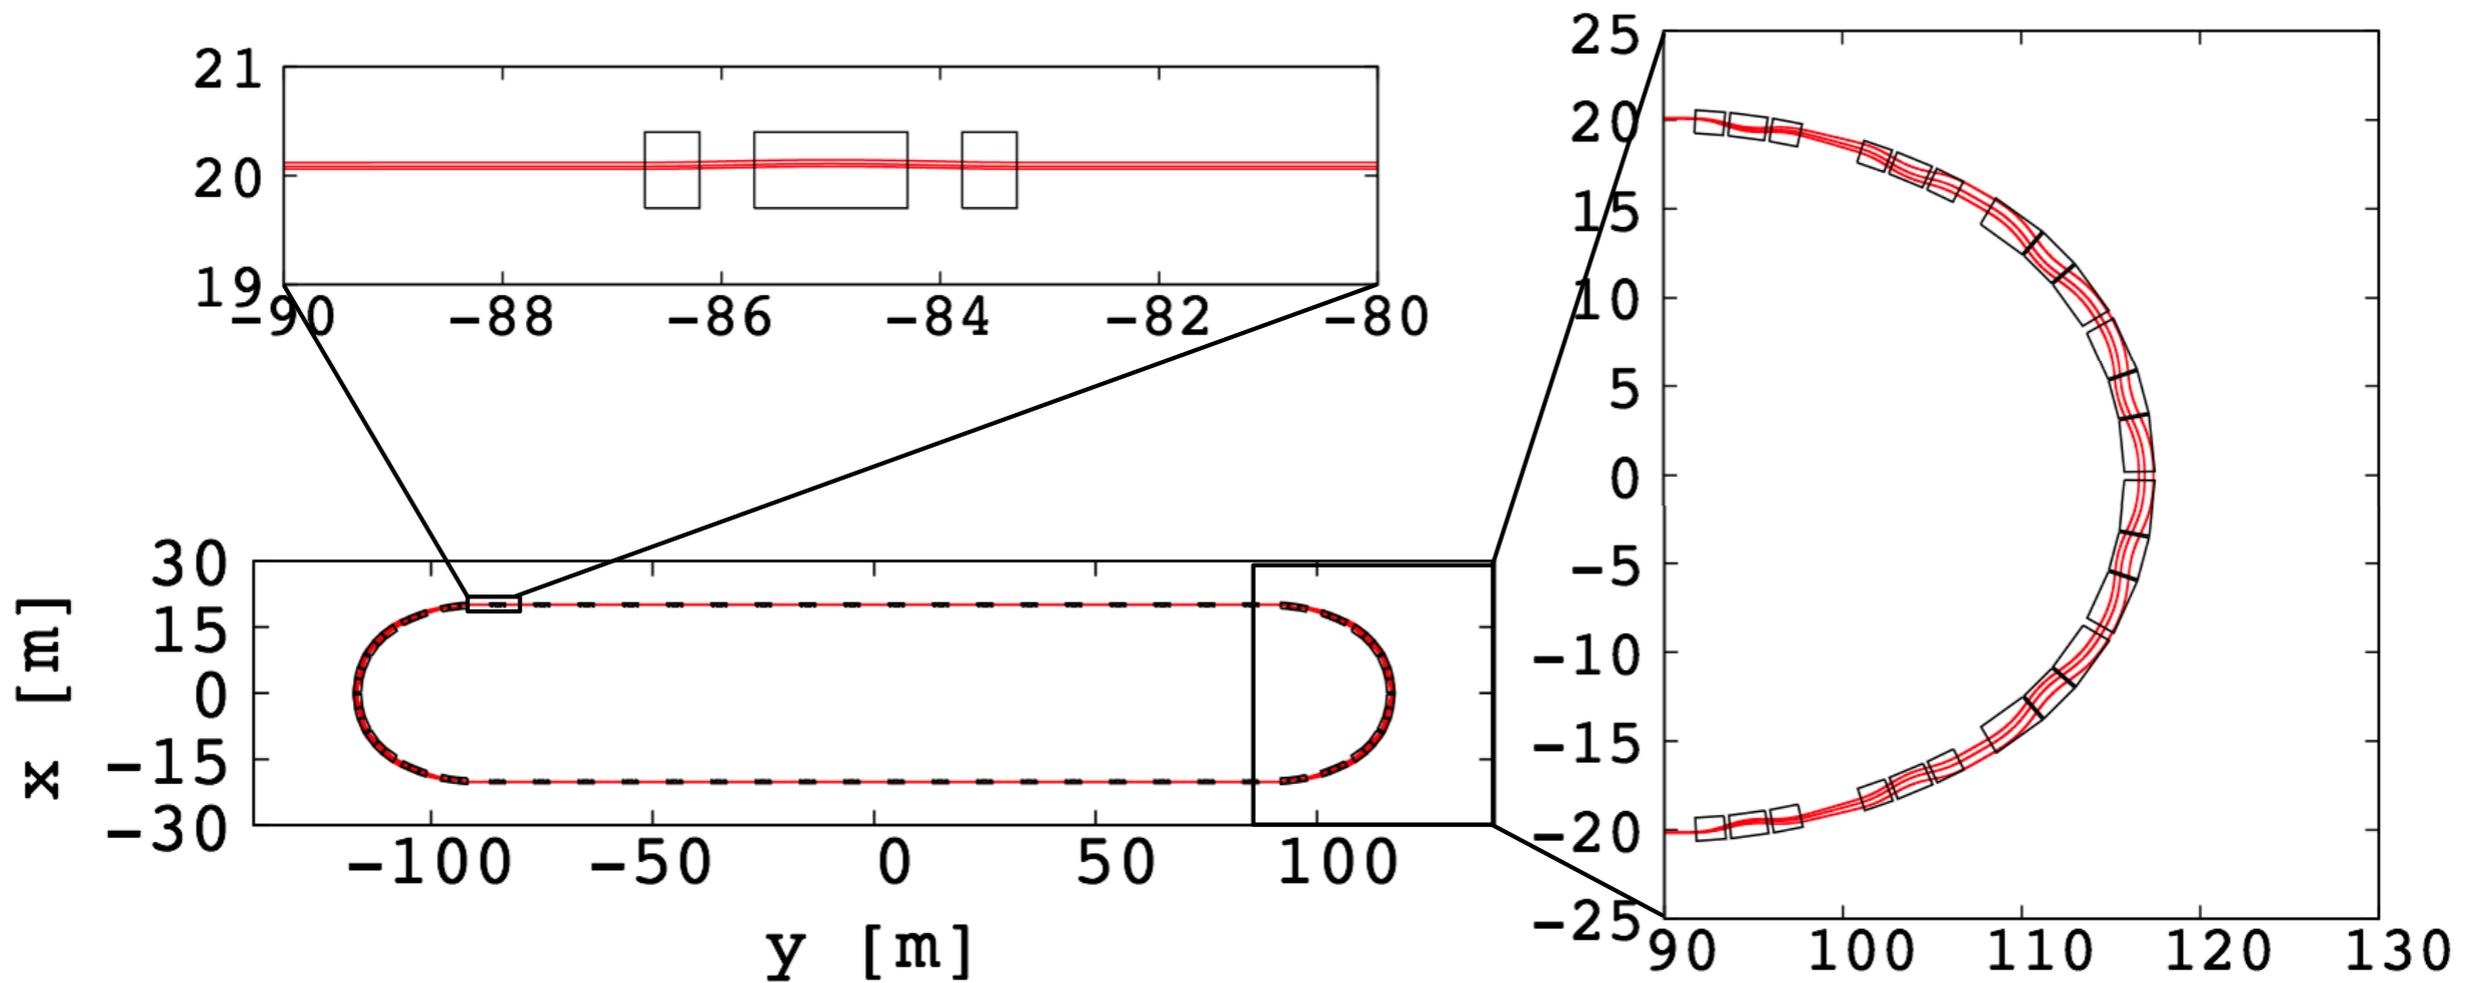

1300 km decay scenario incompatible with scallop of the closed orbit.

Doublet in the straight section cannot be used.

→ Triplet in the straight section.

Triplet solution

Straight: 180 m, maximum scallop angle: 24 mrad

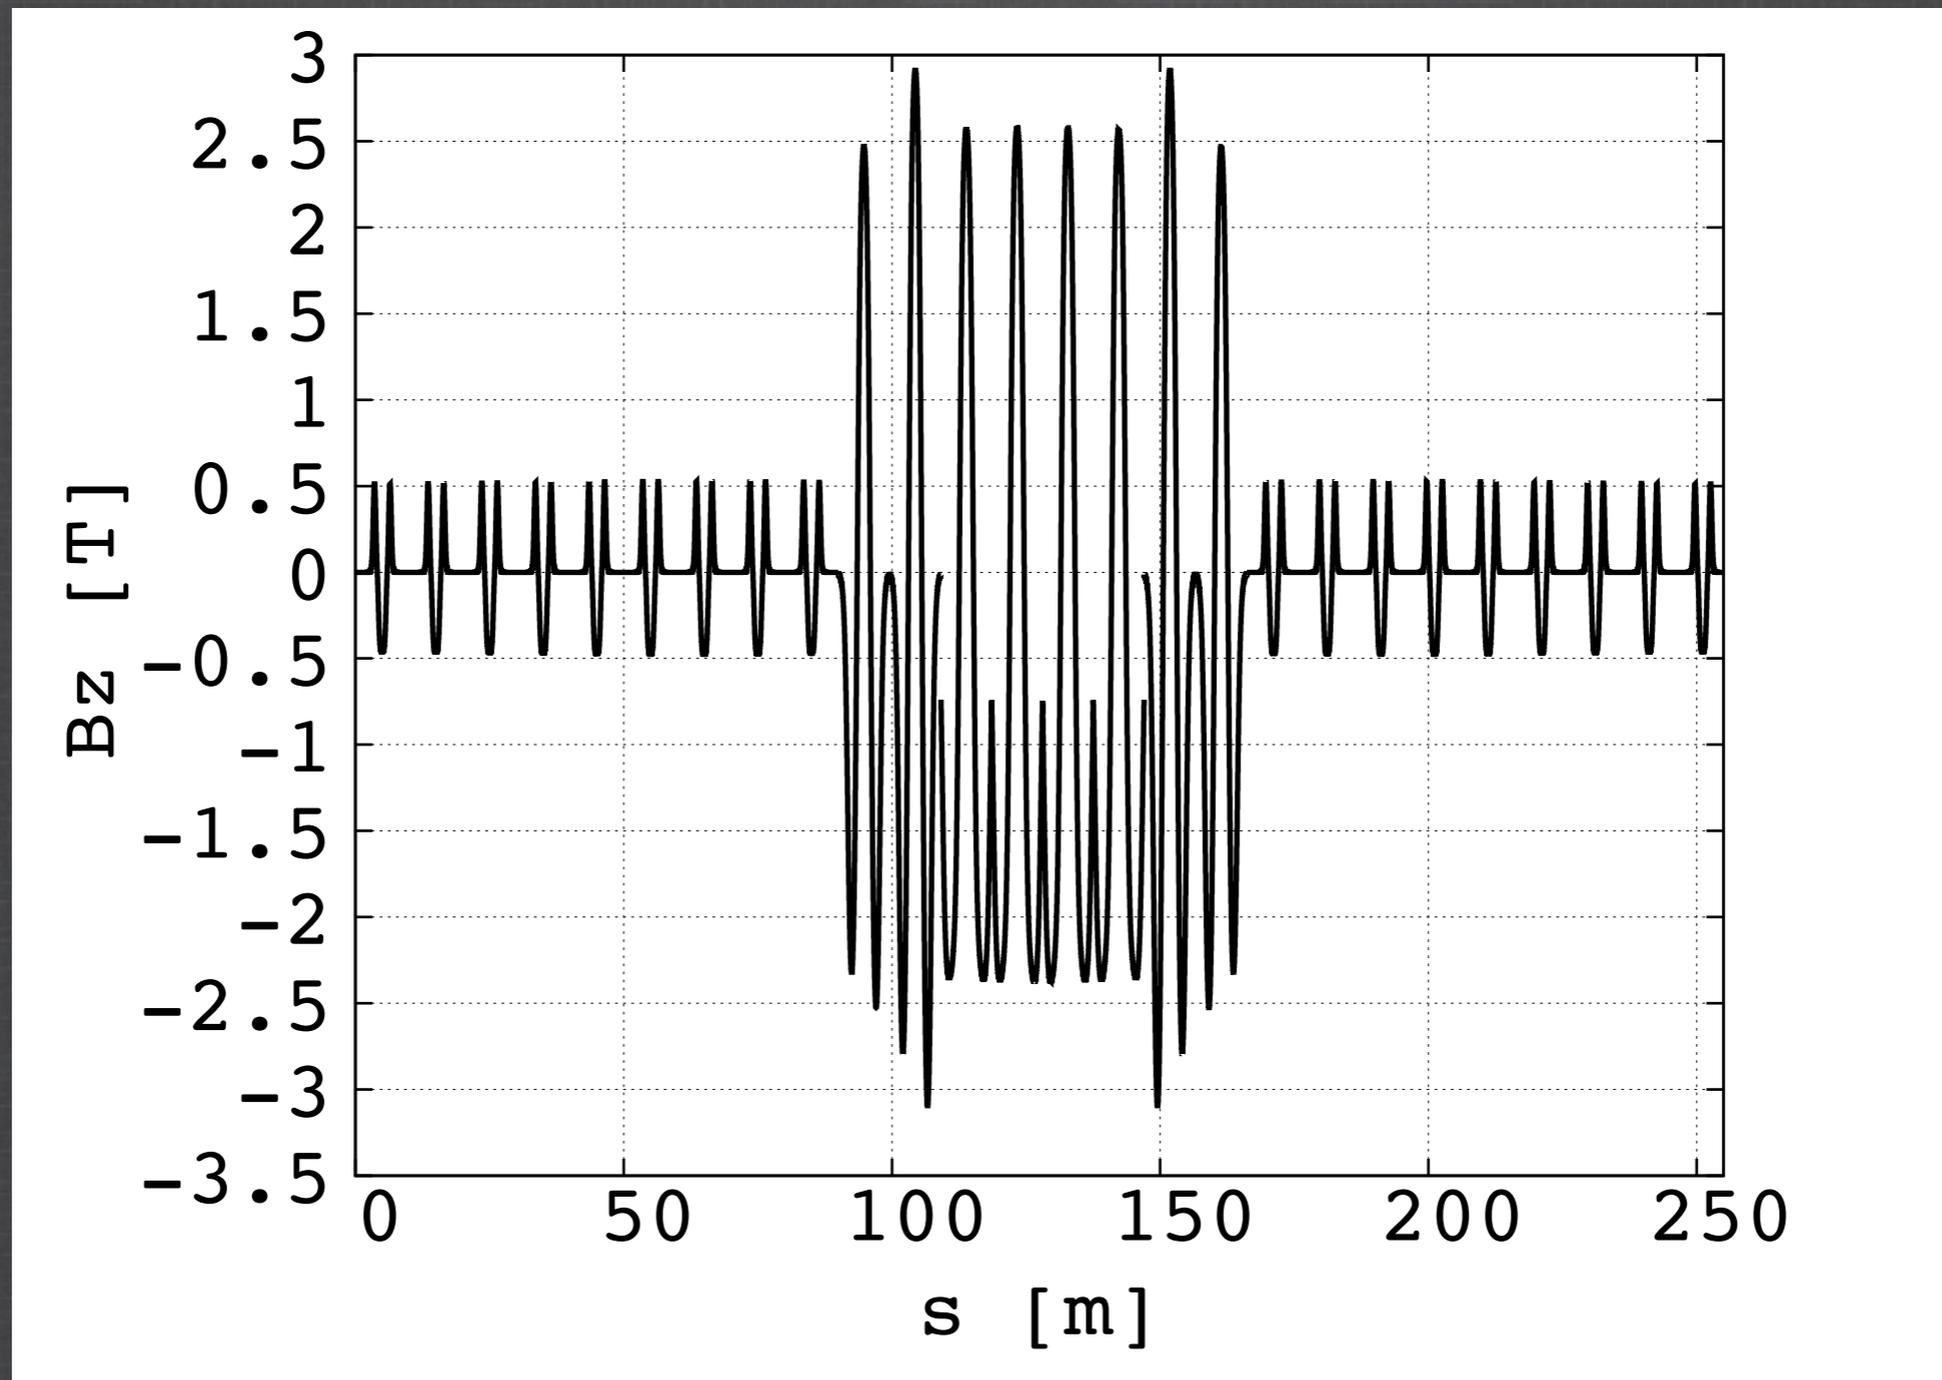

Triplet solution

Cell parameters

	Circular Section	Matching Section	Straight Section
Type	FDF	FDF	DFD
Cell radius/length [m]	17.6	36.2	10
Opening angle [deg]	30	15	
k-value/m-value	6.057	26.	5.5 m ⁻¹
Packing factor	0.92	0.58	0.24
Maximum magnetic field [T]	2.5	3.3	1.5
horizontal excursion [m]	1.3	1.1	0.6
Full gap height [m]	0.45	0.45	0.45
Average dispersion /cell [m]	2.5	1.3	0.18
Number of cells /ring	4 × 2	4 × 2	36 × 2

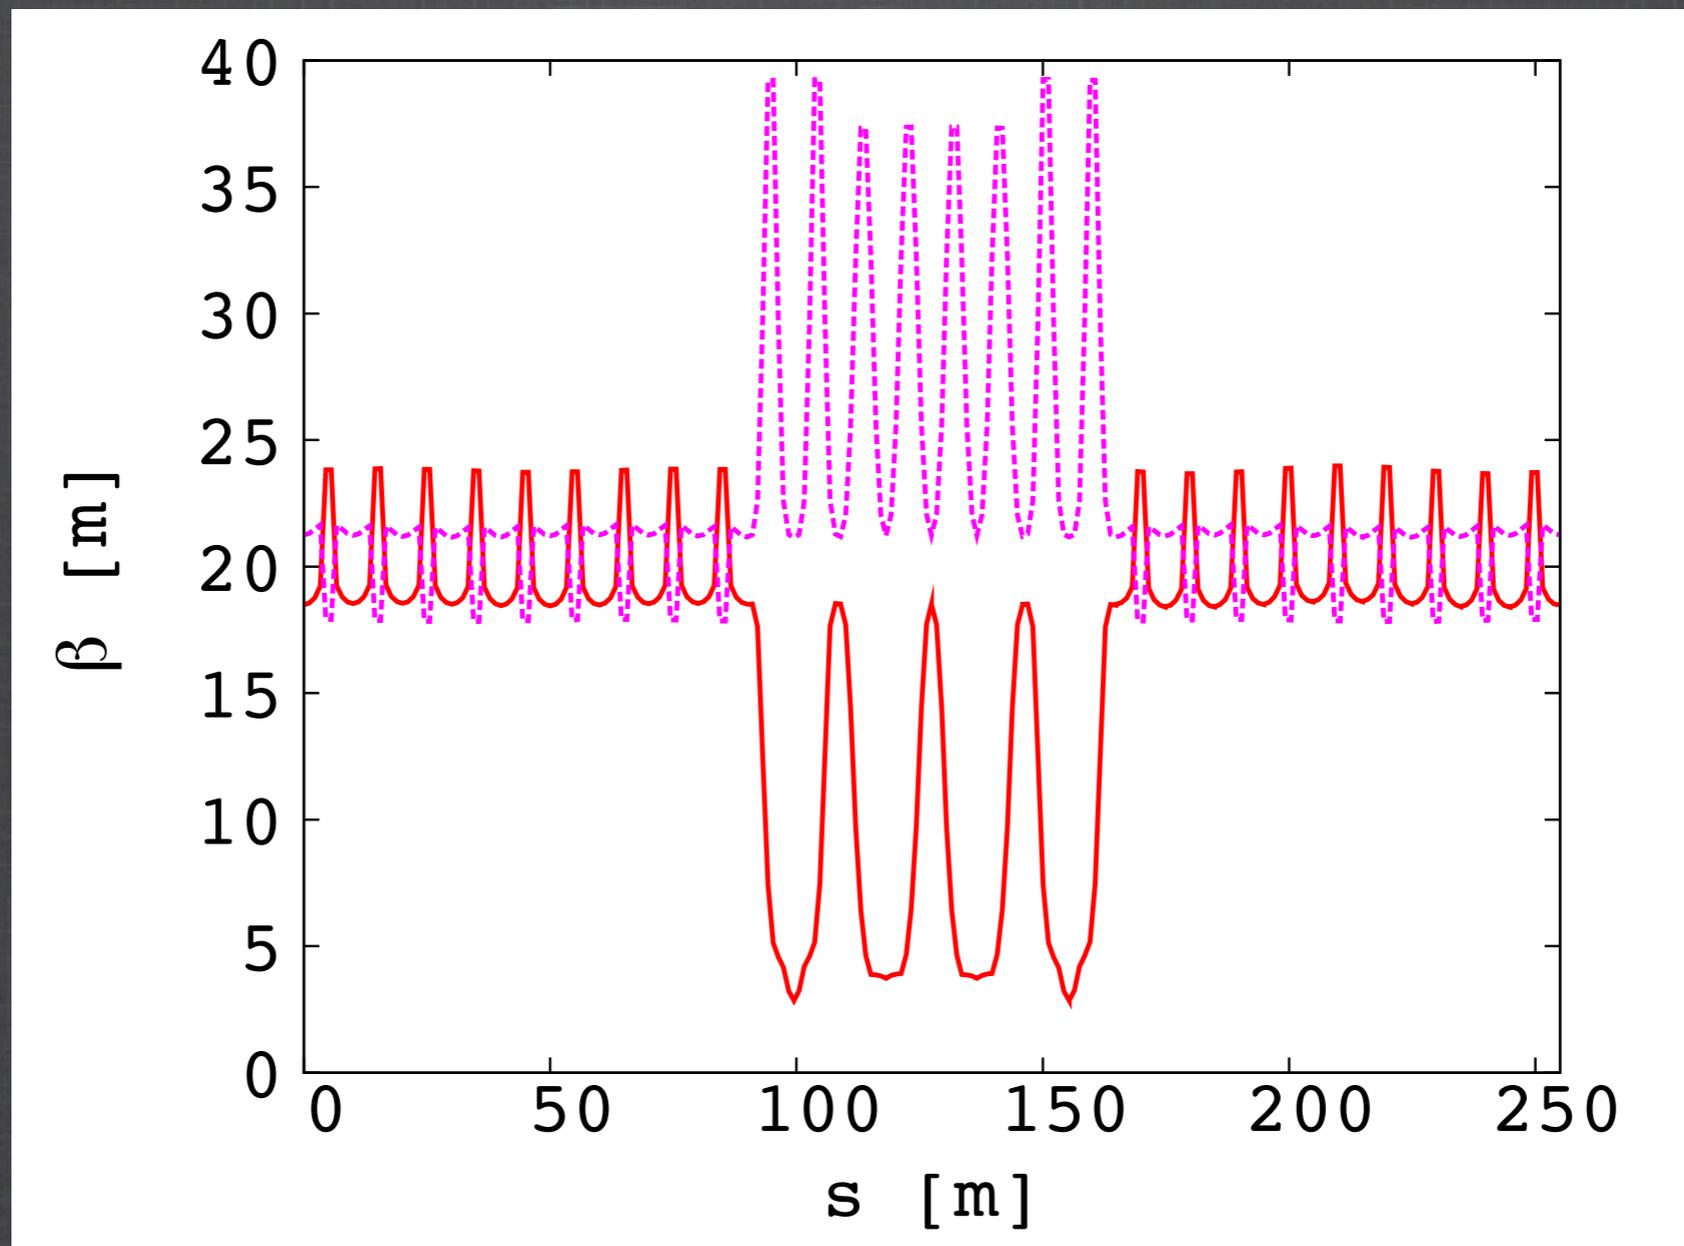

Triplet solution

Magnetic field for P_{\max} (+16%)

Triplet solution

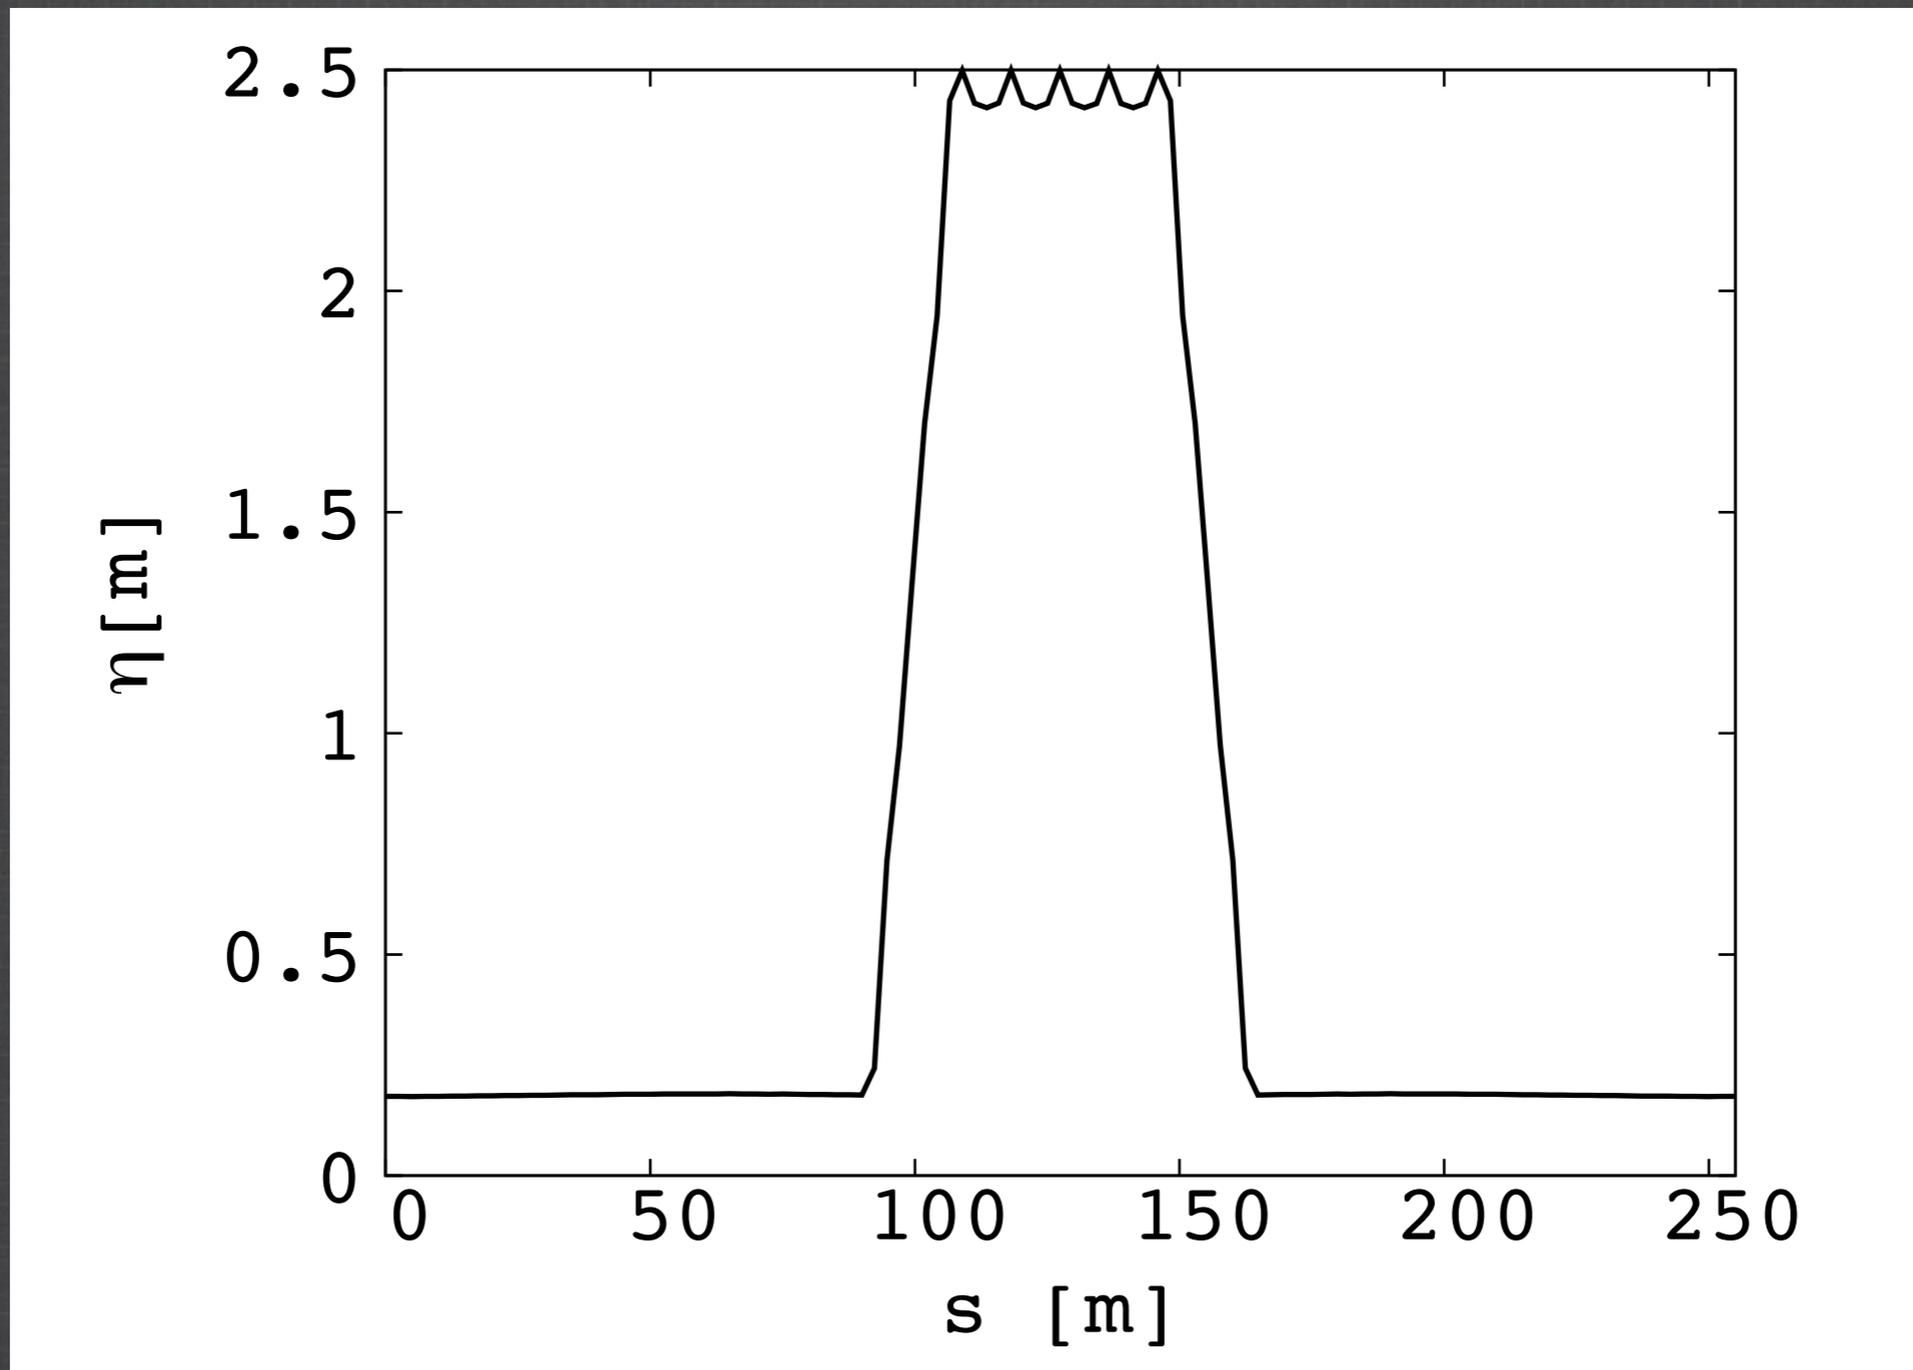

Beta-functions at matching momentum

Horizontal (plain red) and vertical (dotted purple) betafunctions for half of the ring.

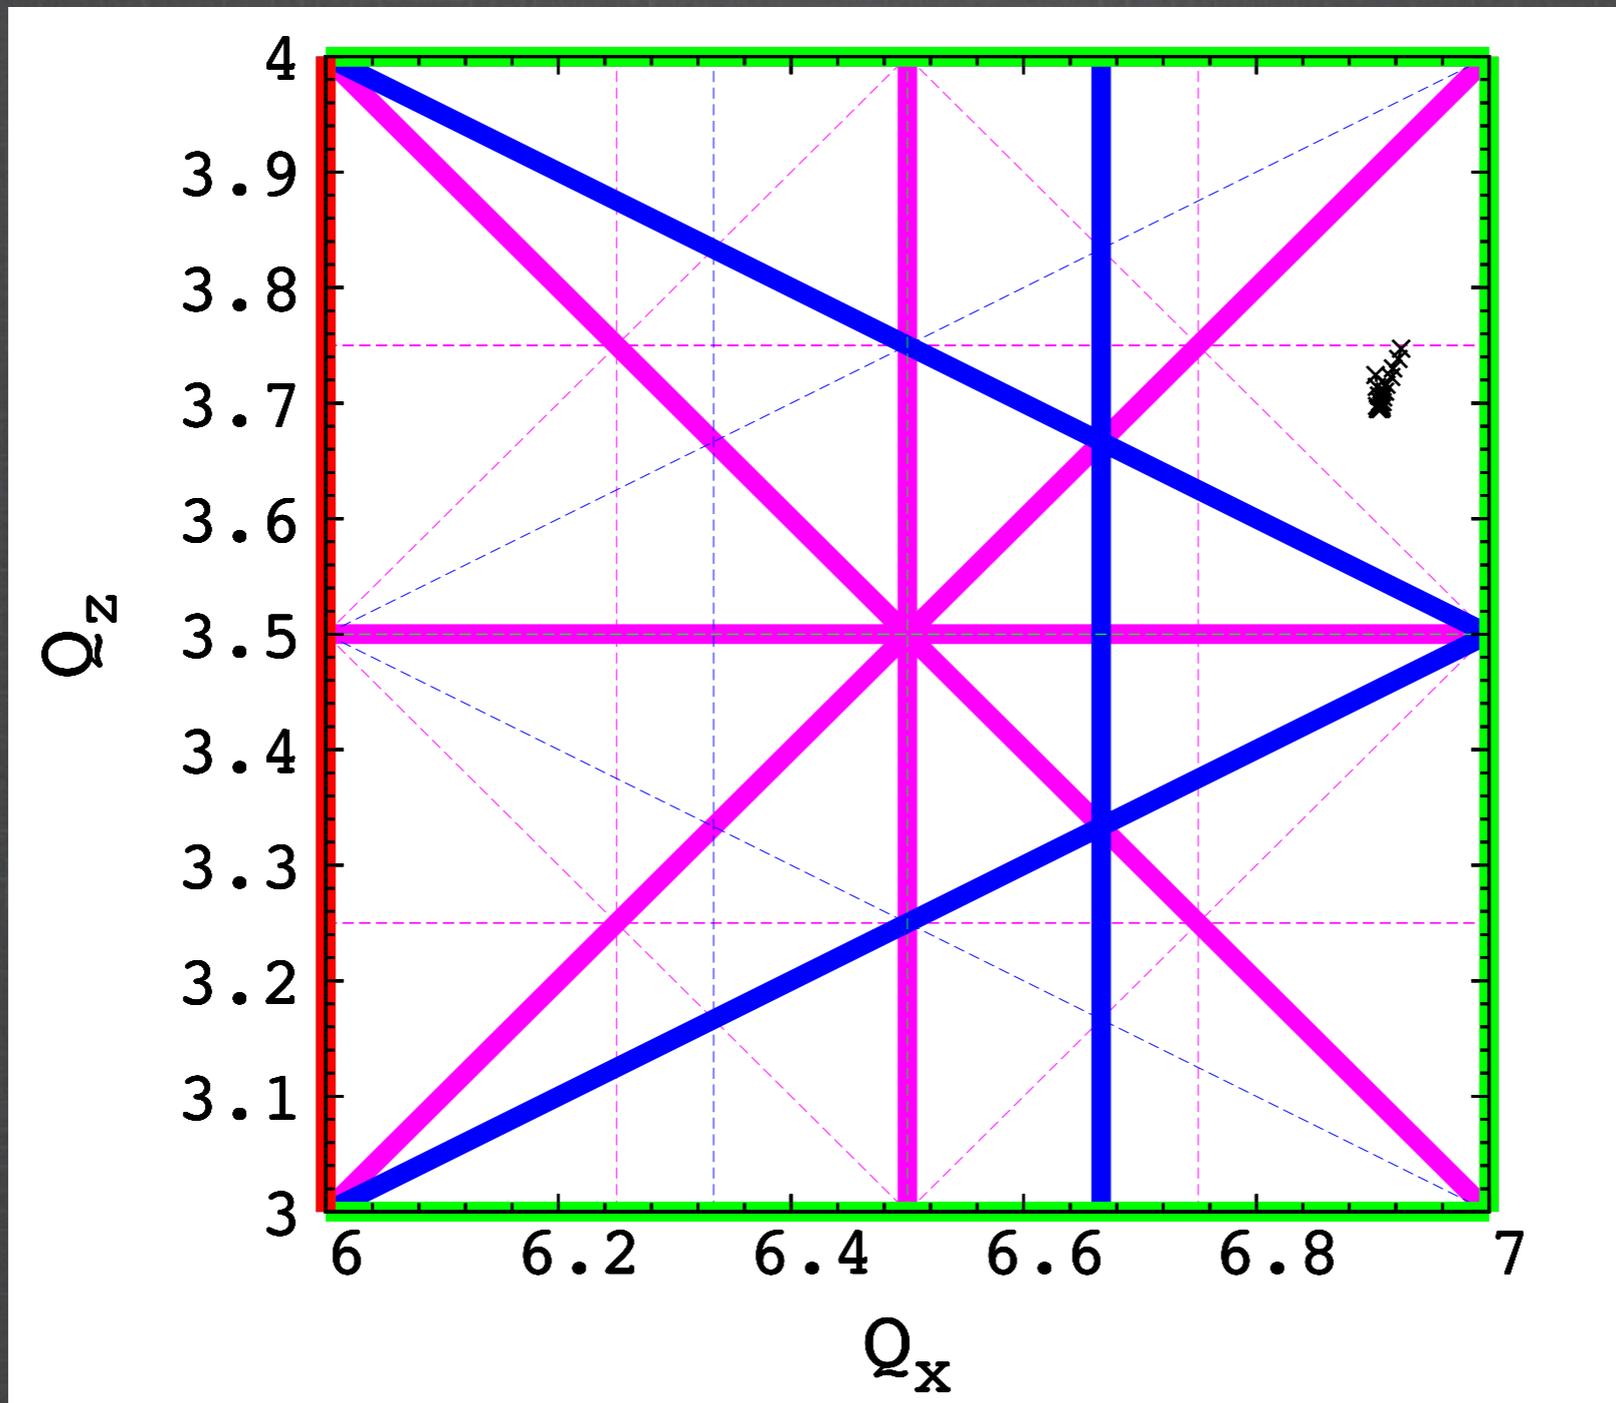

Triplet solution

Dispersion function at matching momentum

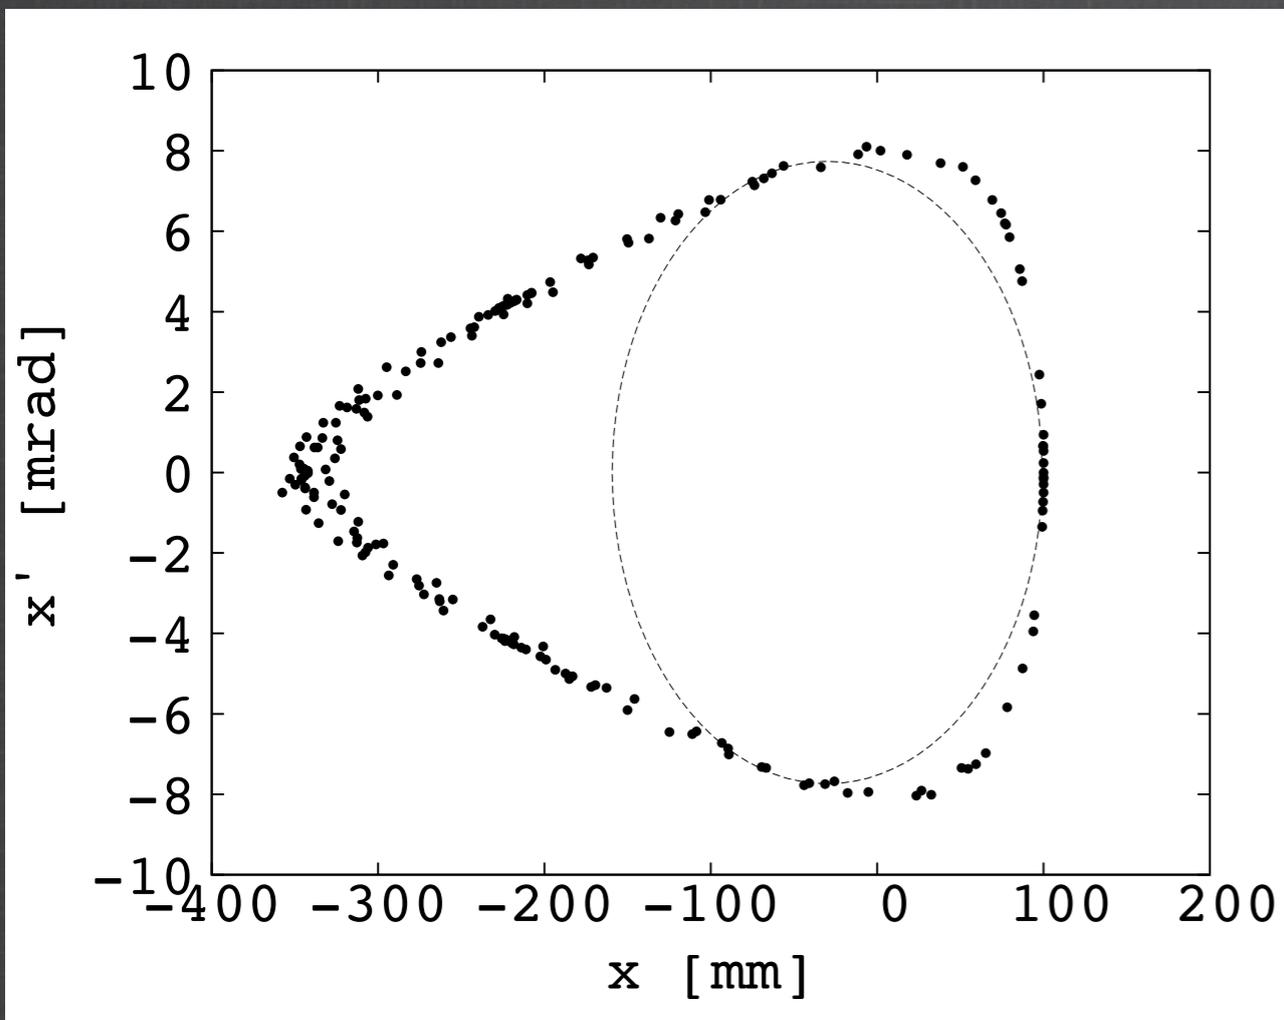

Triplet solution

Tune diagram $\frac{\Delta P}{P} = \pm 16\%$

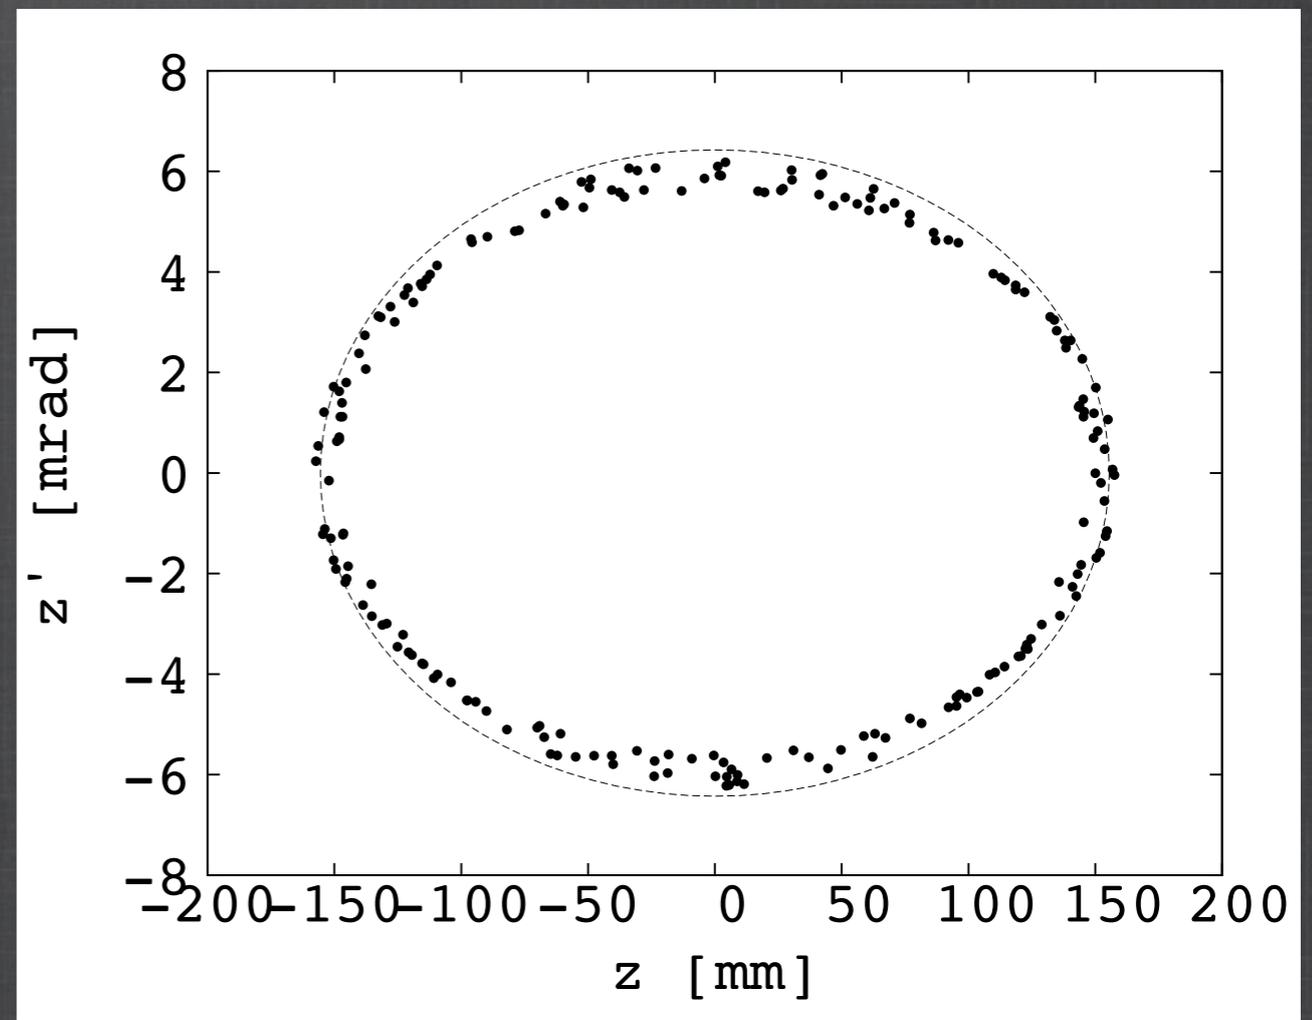

Triplet solution

Transverse acceptance

Maximum horizontal stable amplitude over 100 turns

Maximum vertical stable amplitude over 100 turns

Preliminary Stochastic injection geometry

(J. Pasternak)

Injection with matched dispersion

(J. Pasternak)

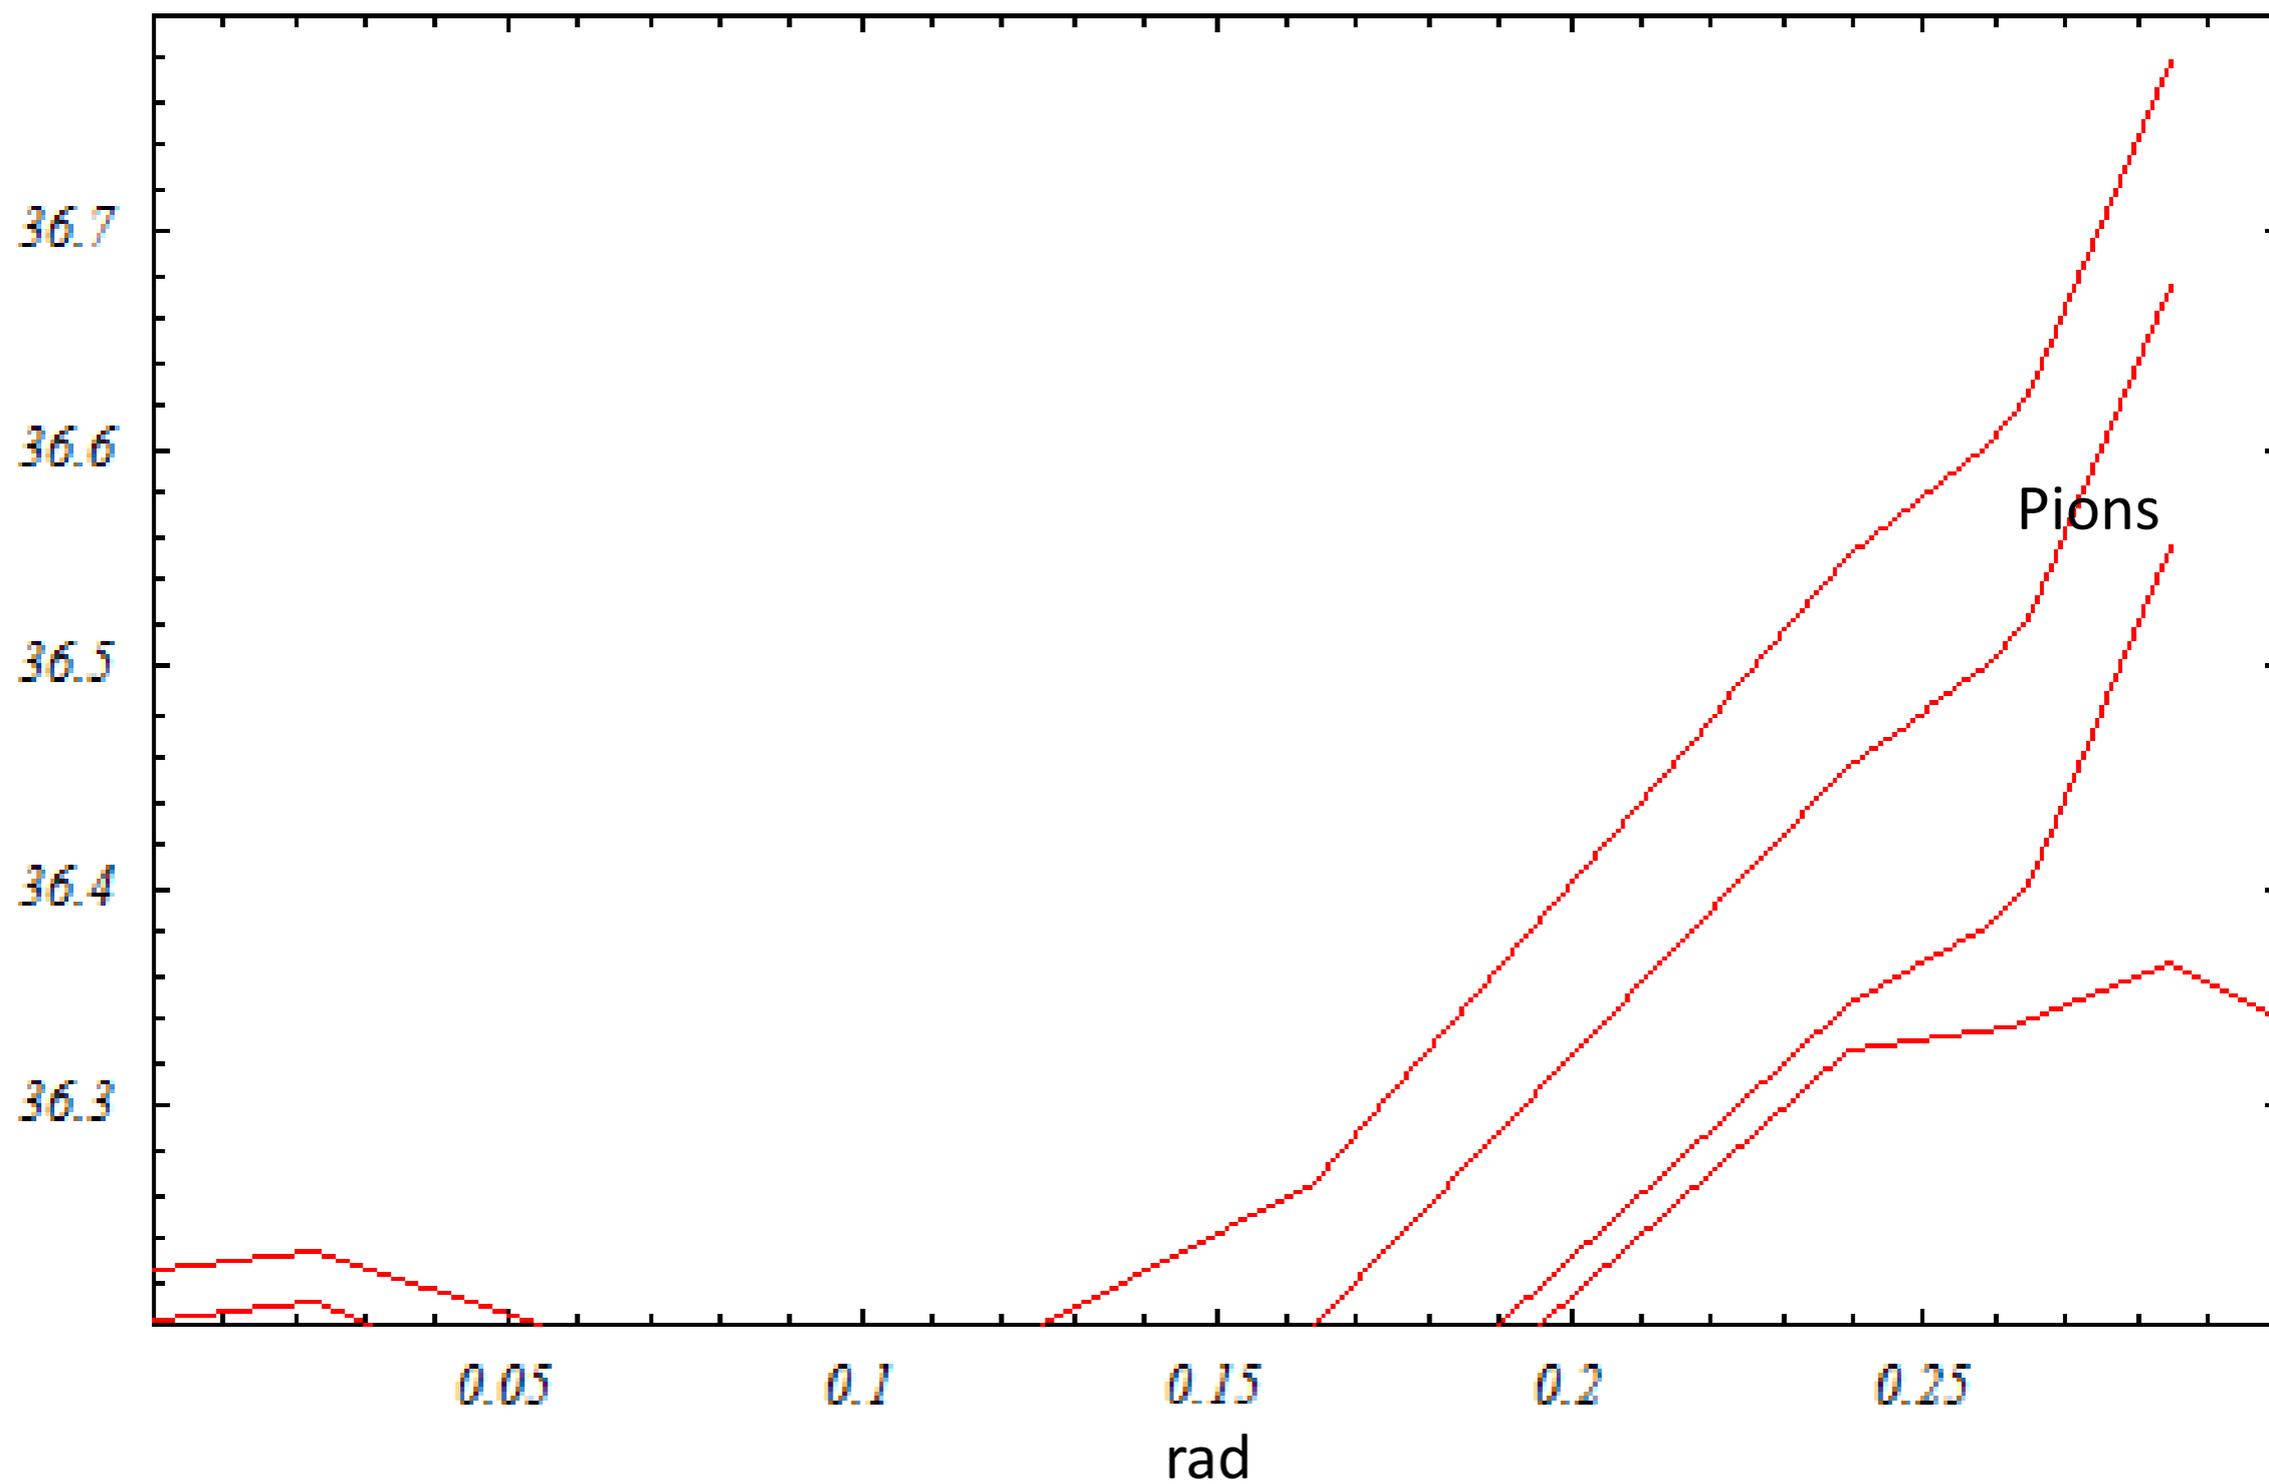

Injection parameters with matched dispersion

- Septum field 1.4 T (room temperature)
- Septum thickness/length $\sim 2\text{cm}/\sim 72\text{cm}$
- It requires SC dipole/septum of 4 T and 6 cm thickness to be placed upstream (72 cm in length)
- It gives 20 cm beam clearance at the upstream FFAG magnet.
- Alternatively we could use $\sim 2\text{cm}/164\text{ cm}$ SC septum with 1.8T (results are pretty the same)

(J. Pasternak)

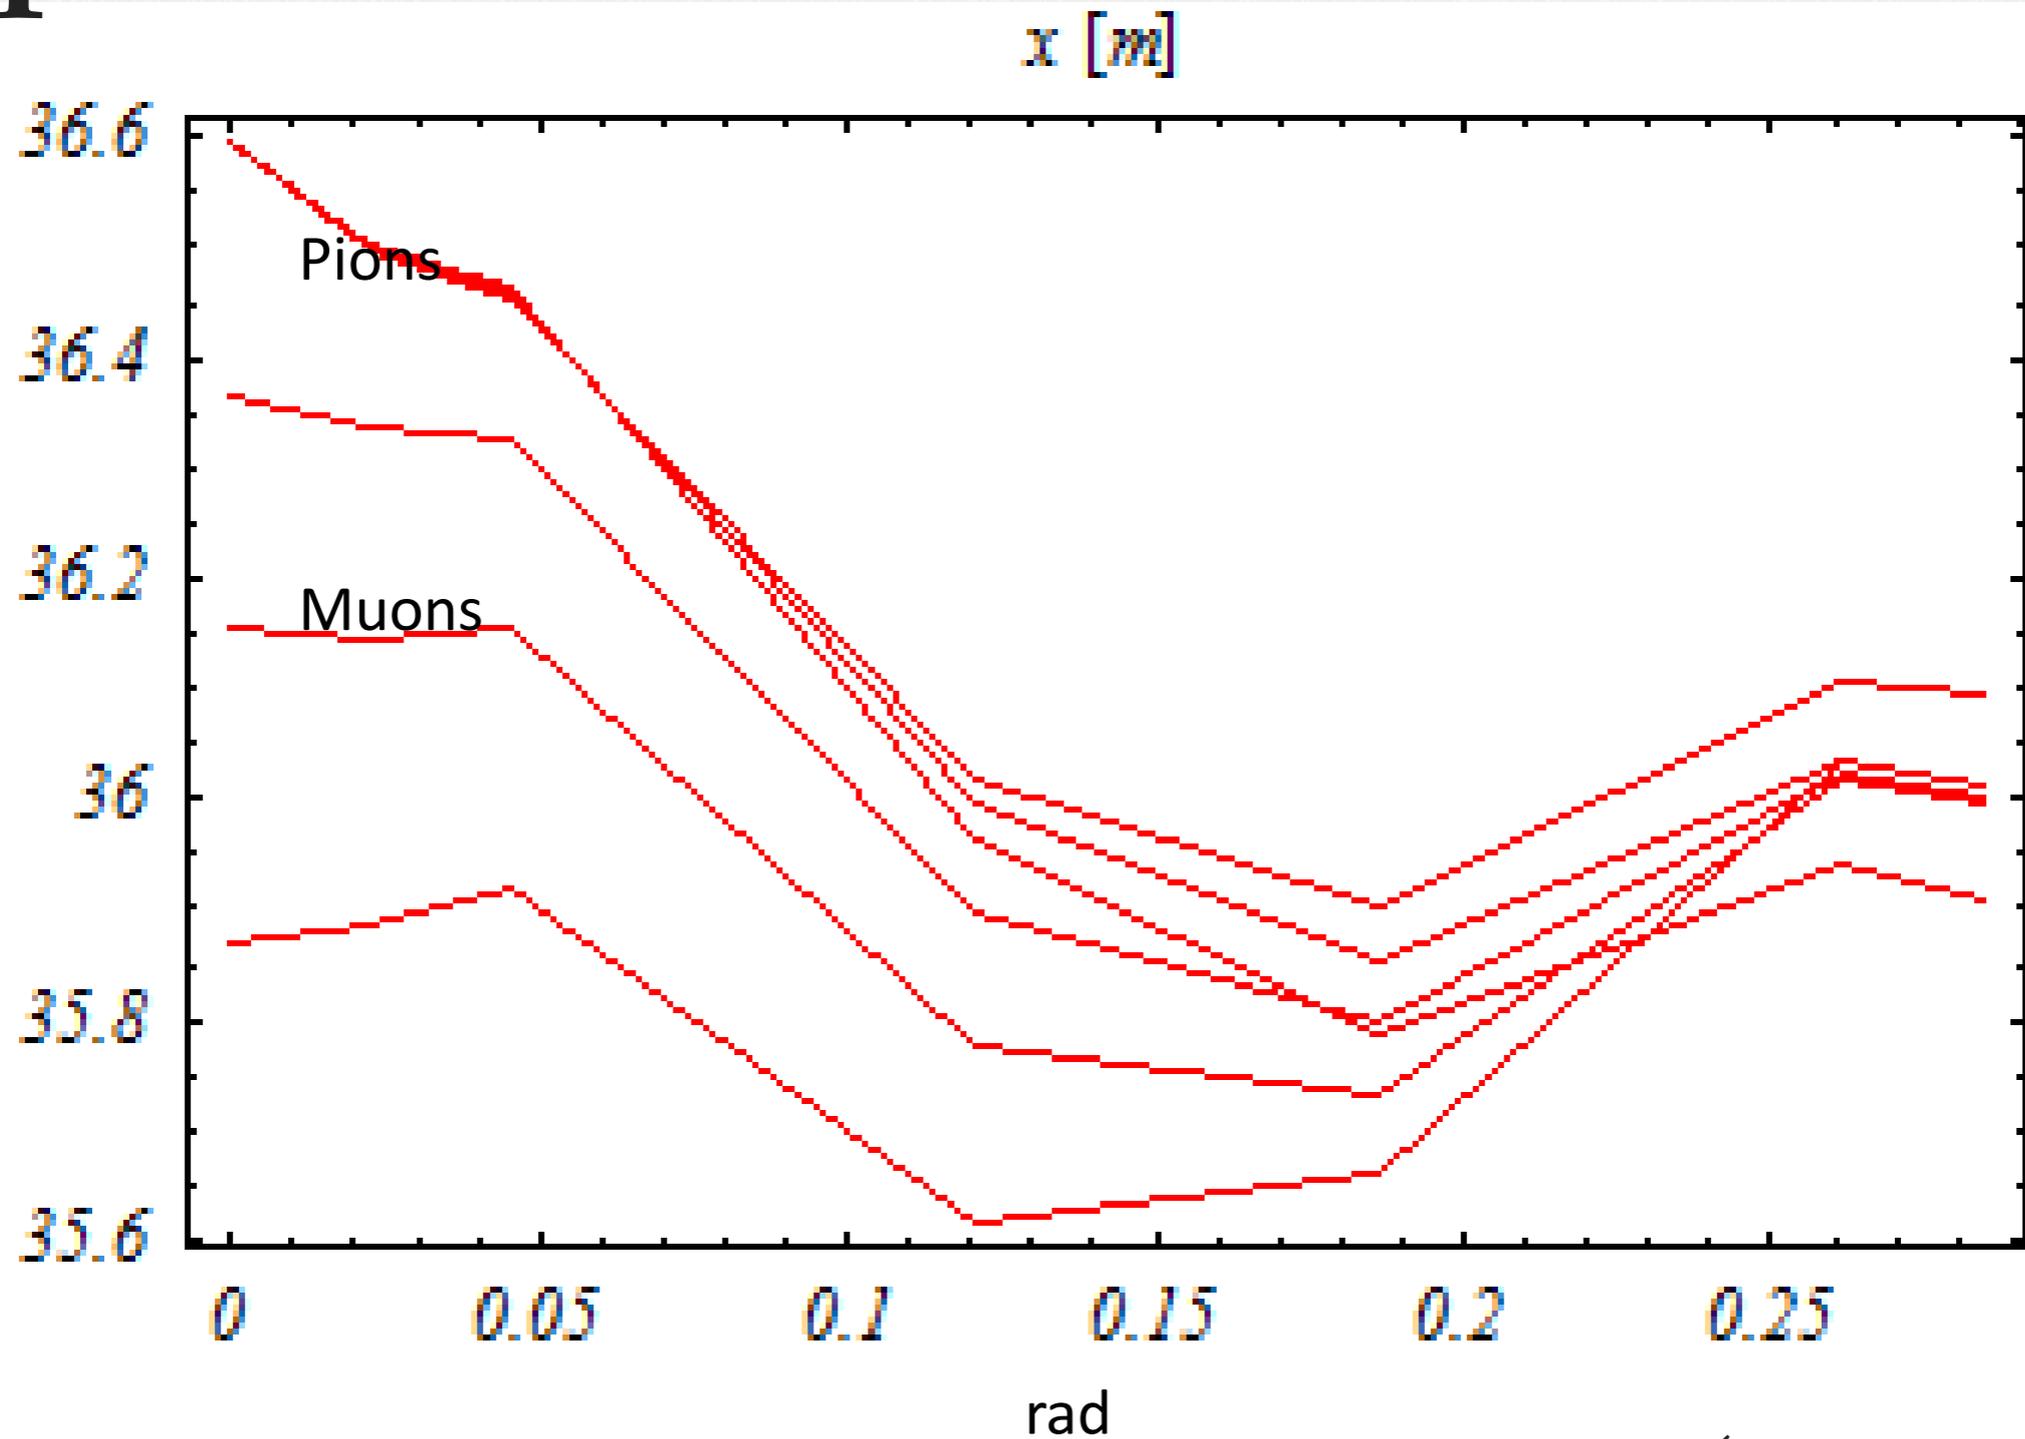

Zoom in

(J. Pasternak)

Injection with no dispersion (reversed direction)

(J. Pasternak)

Injection parameters with no dispersion

- Septum field 0.8 T (room temperature)
- Septum thickness/length $\sim 2\text{cm}/\sim 164\text{cm}$
- It gives 20 cm beam clearance at the upstream FFAG magnet.
- The pion orbits will oscillate in the decay section. We need to evaluate, how this affects the muon collection efficiency.

Outline

● Doublet solution

● Triplet solution

● Injection

● Improvements

Future improvements

- Small scallop angle in the straight: reduce the portion of the straight cell with scallop.
- Larger DA: smaller gradient (m-value) in the straight section
- Smaller magnets in the arcs: reduce the maximum dispersion in the arcs (> 1.3 m necessary for injection).
- Neutrino flux estimation from pion & muon decay for doublet and triplet lattice, and comparison with FODO (see D. Adey's talk).

Thank you for your attention
