

p_T dependent event-plane angle:
A further step in understanding initial state
fluctuations in PbPb and pPb collisions

**WPCF 2014: Xth Workshop on Particle Correlations and
Femtoscscopy**

**Damir Devetak
CMS Collaboration**

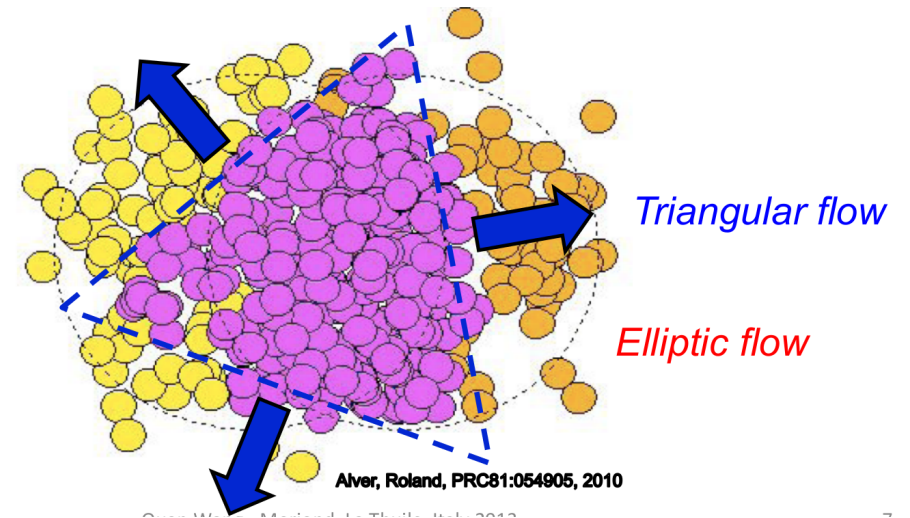

Motivation

► Single particle distribution

$$\frac{dN}{d\phi} \sim 1 + \underbrace{2v_2 \cos[2(\phi - \Psi_2)]}_{\text{elliptic flow}} + \underbrace{2v_3 \cos[3(\phi - \Psi_3)]}_{\text{triangular flow}} + \dots$$

$$v_n = \langle \cos[n(\phi - \Psi_n)] \rangle$$

Two particle correlations: $\frac{dN}{d\Delta\phi} \sim 1 + 2V_{2\Delta} \cos 2\Delta\phi + 2V_{3\Delta} \cos 3\Delta\phi$

Asymmetric pressure gradients

Initial state fluctuations

Motivation

- ▶ **Connect $V_{n\Delta}$ and v_n :**

$$V_{n\Delta}(p_{T_1}, p_{T_2}) = \langle v_n(p_{T_1}) v_n(p_{T_2}) \times \cos[n(\Psi_n(p_{T_1}) - \Psi_n(p_{T_2}))] \rangle$$

$\neq 1$

initial state fluctuations $\rightarrow \Psi_n(p_T) \rightarrow$ factorization breaking

- ▶ $\Psi_n(p_T)$ determined by final-state particles
- ▶ $\Psi_n(p_T)$ fluctuates from event to event

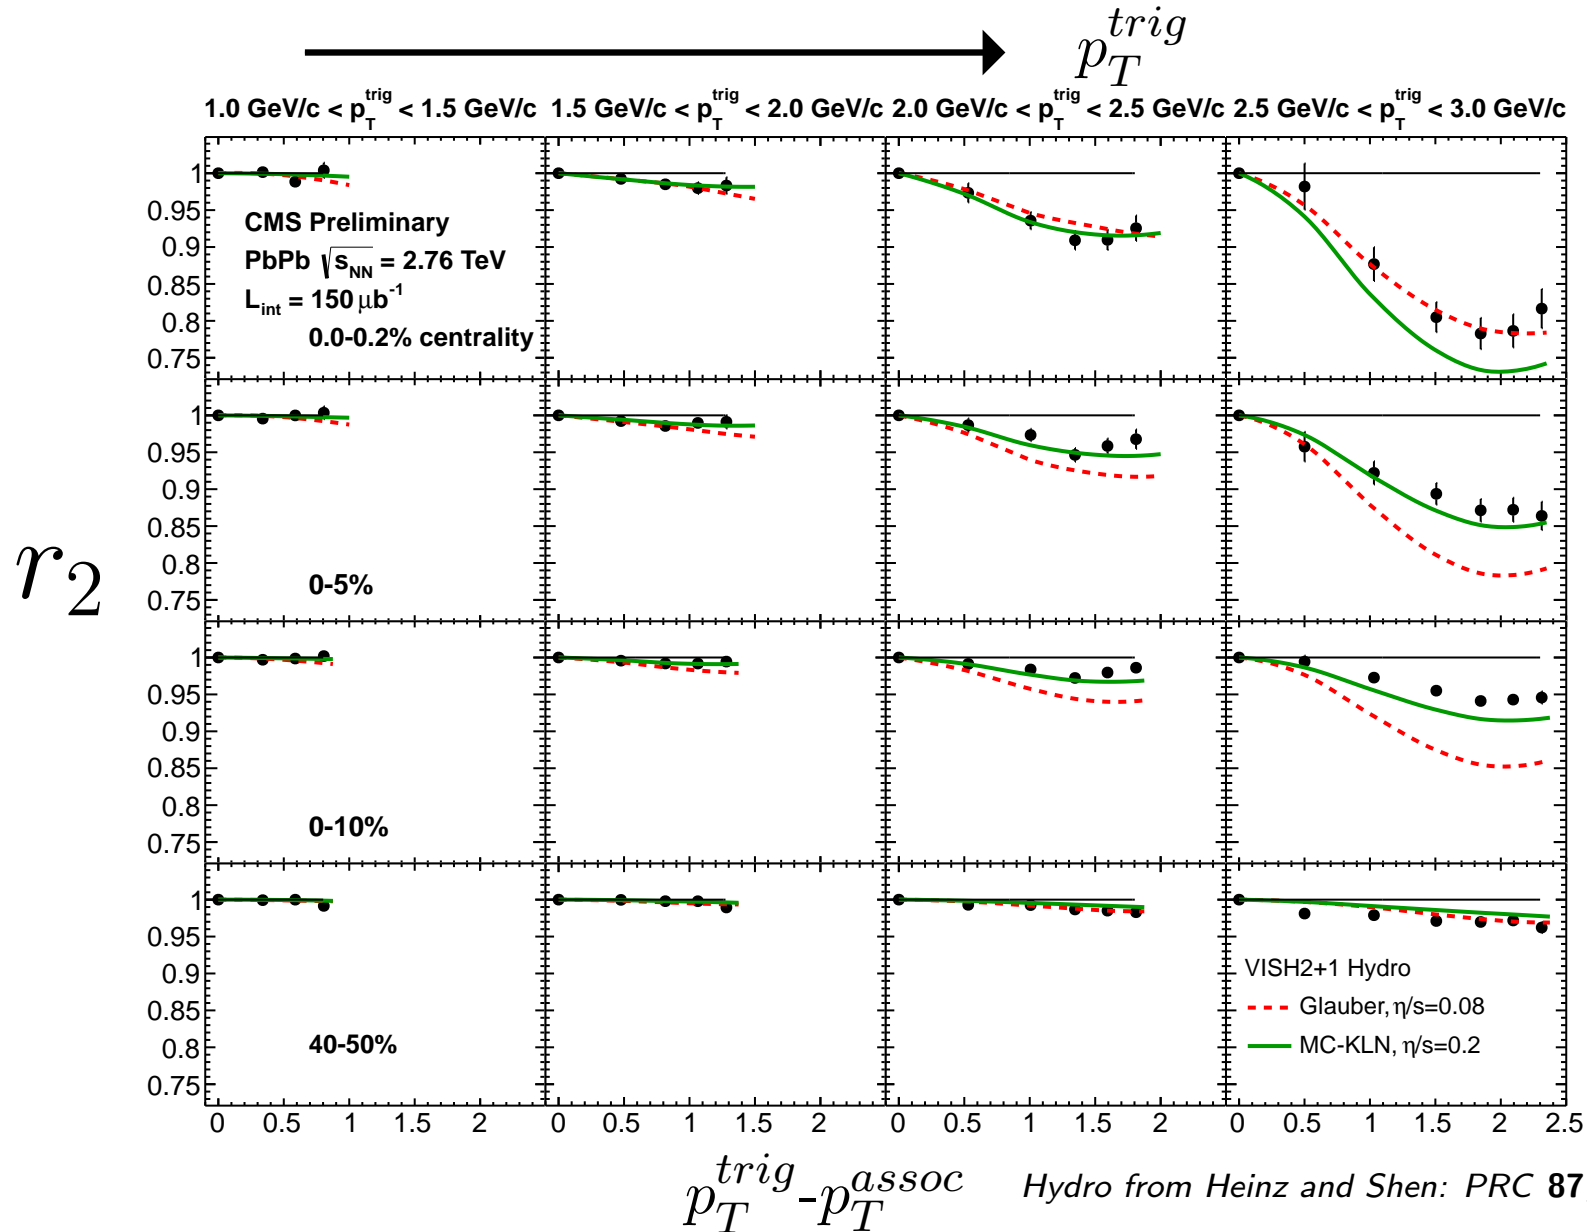

Papers on the subject:

- ▶ **Ollitrault et. al.**, Phys. Rev. C **87**, 031901(2013) and **U. W. Heinz et. al.**, Phys. Rev. C **87**, 034913 (2013)
- ▶ **CMS collaboration**: Studies of azimuthal dihadron correlations in ultra-central PbPb collisions at $\sqrt{s_{NN}} = 2.76 TeV$, JHEP **1402** (2014)088

Motivation

$$r_n = \frac{V_{n\Delta}(p_{T1}, p_{T2})}{\sqrt{V_{n\Delta}(p_{T1}, p_{T1})V_{n\Delta}(p_{T2}, p_{T2})}}$$

$$r_n = \begin{cases} 1 & \text{factorization} \\ < 1 & \text{factorization breaking} \end{cases}$$

Motivation

Theory: $V_{n\Delta} = \langle \cos(n\Delta\phi) \rangle$, $\Delta\phi = \phi_1 - \phi_2$

Experiment: $V_{n\Delta} = \langle \langle \cos(n\Delta\phi) \rangle \rangle_S - \langle \langle \cos(n\Delta\phi) \rangle \rangle_B$, $|\Delta\eta| > 2$

▶ $\langle \langle \dots \rangle \rangle_B$ remove effect from non-uniform detector acceptance

- ▶ Long range correlation in pPb!
- ▶ Initial state fluctuations?
- ▶ Expect large effect as in UCC PbPb?

Look at hydro model predictions

- ▶ Kozlov et. al. [arXiv:1405.3976] model
- ▶ Heinz-Shen VISH2+1: PRC **87**, 034913 (2013) model

Constrain initial condition and η/s

(b) CMS pPb $\sqrt{s_{NN}} = 5.02$ TeV, $220 \leq N_{\text{trk}}^{\text{offline}} < 260$

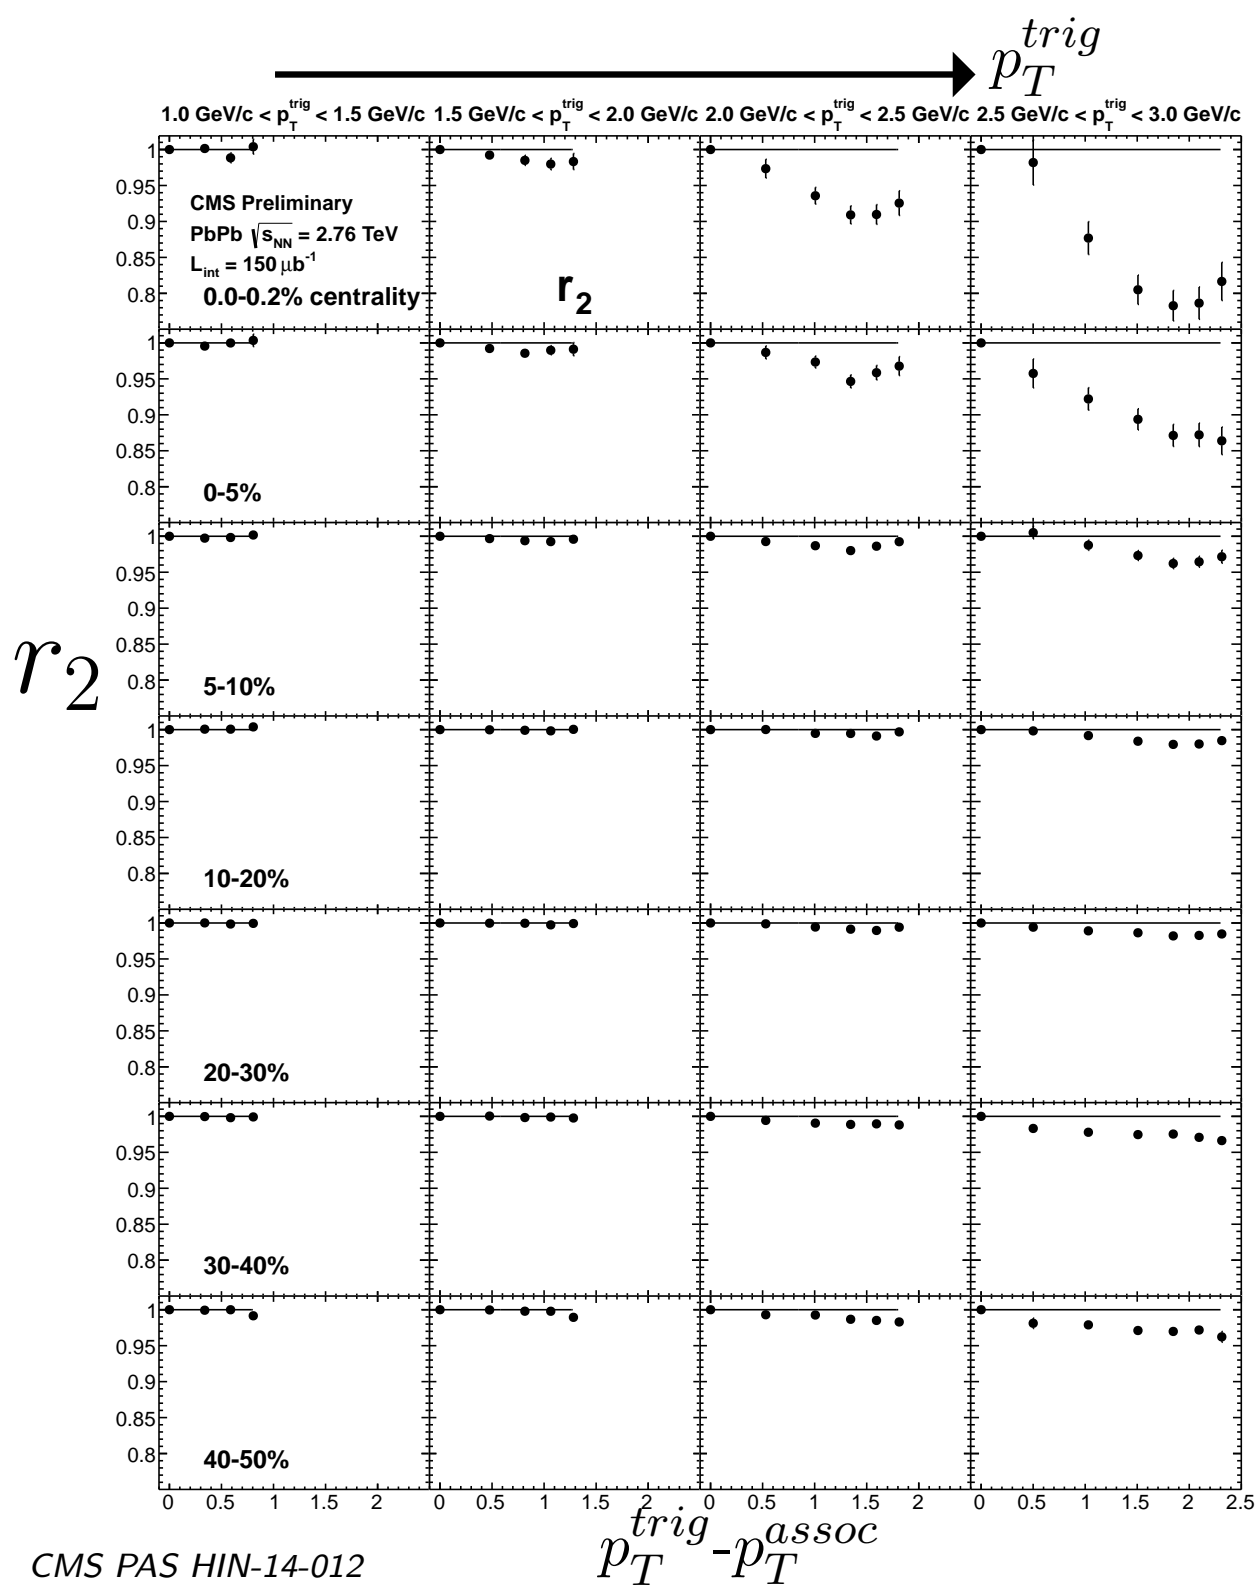

$1 < p_T^{\text{trig}} < 3$ GeV/c

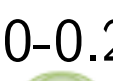

$1 < p_T^{\text{assoc}} < 3$ GeV/c

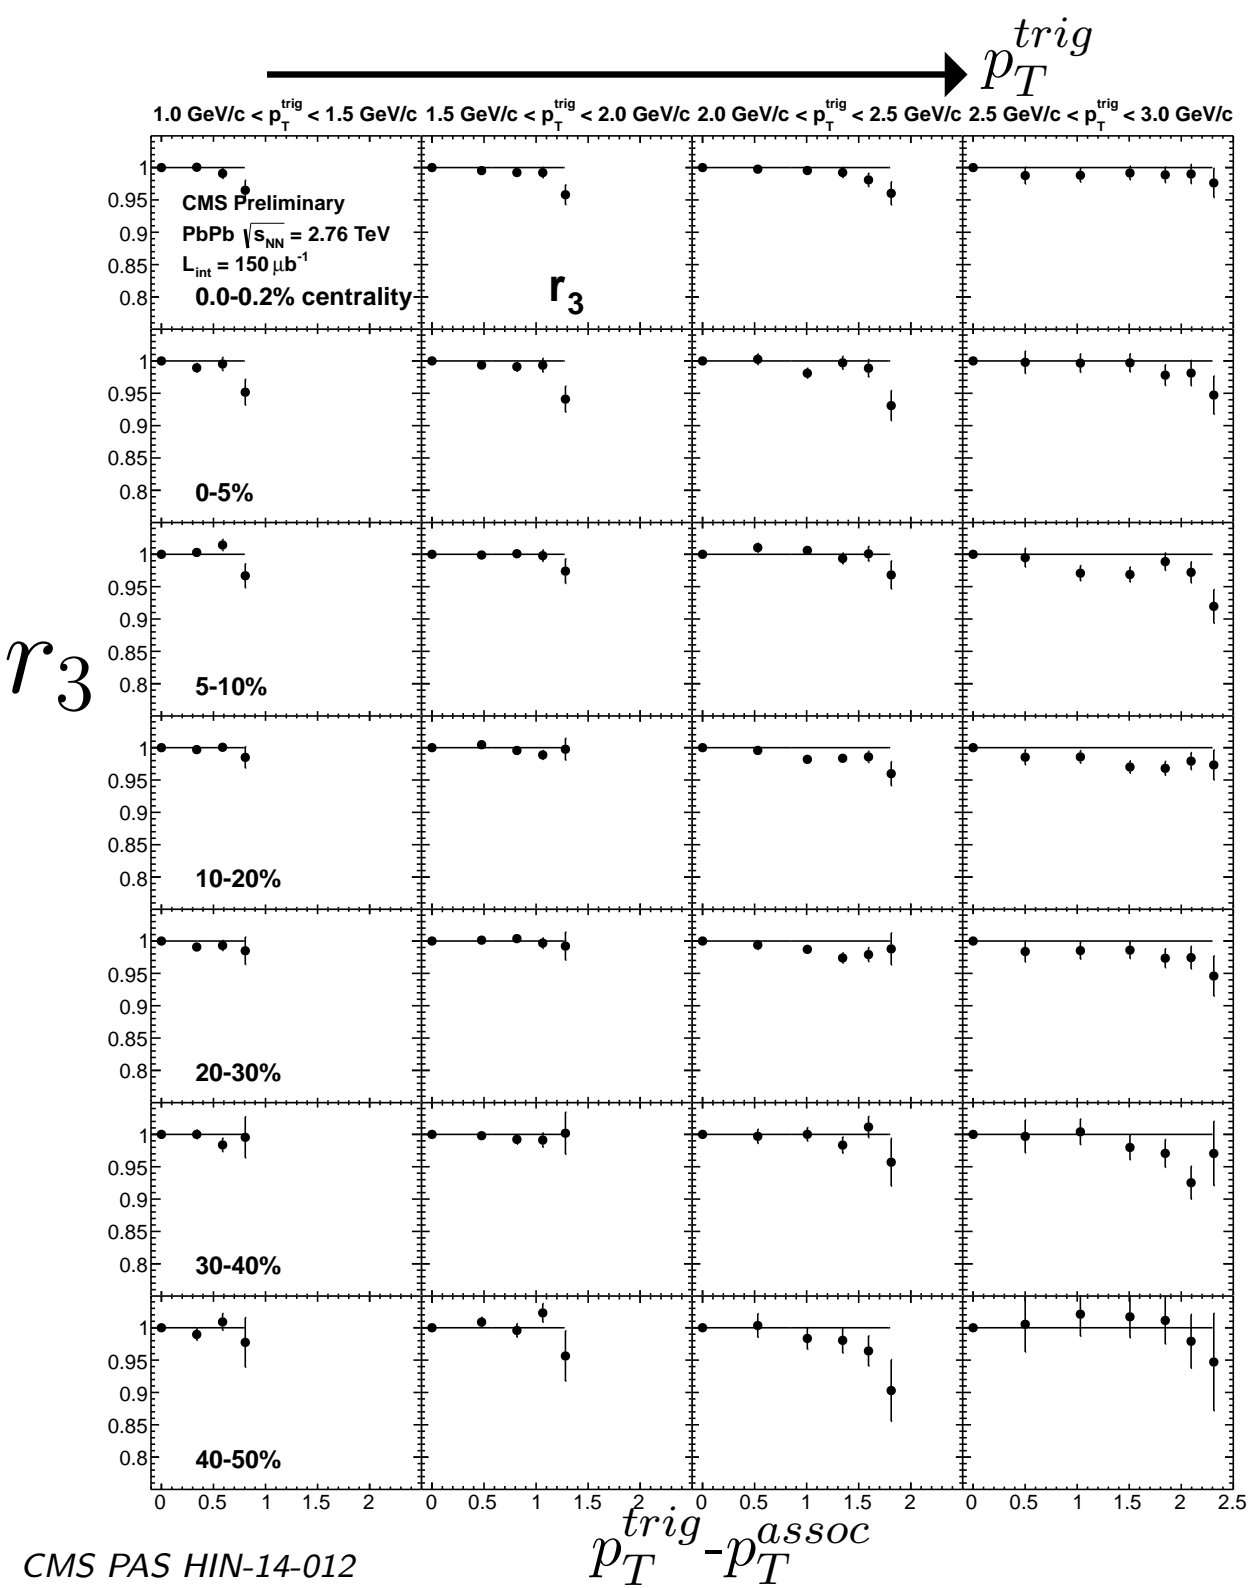

RIDGE

PbPb RESULTS

- 
 0-0.2% ▶ The effect increases with rise of p_T^{trig} and $p_T^{trig} - p_T^{assoc}$
 - ▶ Approaching the central collisions, the effect dramatically increases achieving over 20%
 - ▶ For semi-central collisions, the effect achieves only a size of 2 – 3%
- 
- 

 40-50%

- 0-0.2% \blacktriangleright Factorization holds better for V_3
- \blacktriangleright Breaking visible only for the highest $p_T^{trig} - p_T^{assoc}$
- \blacktriangleright Practically independent of centrality

40-50%

r_2 comparison with VISH2+1 for ultra-central collisions

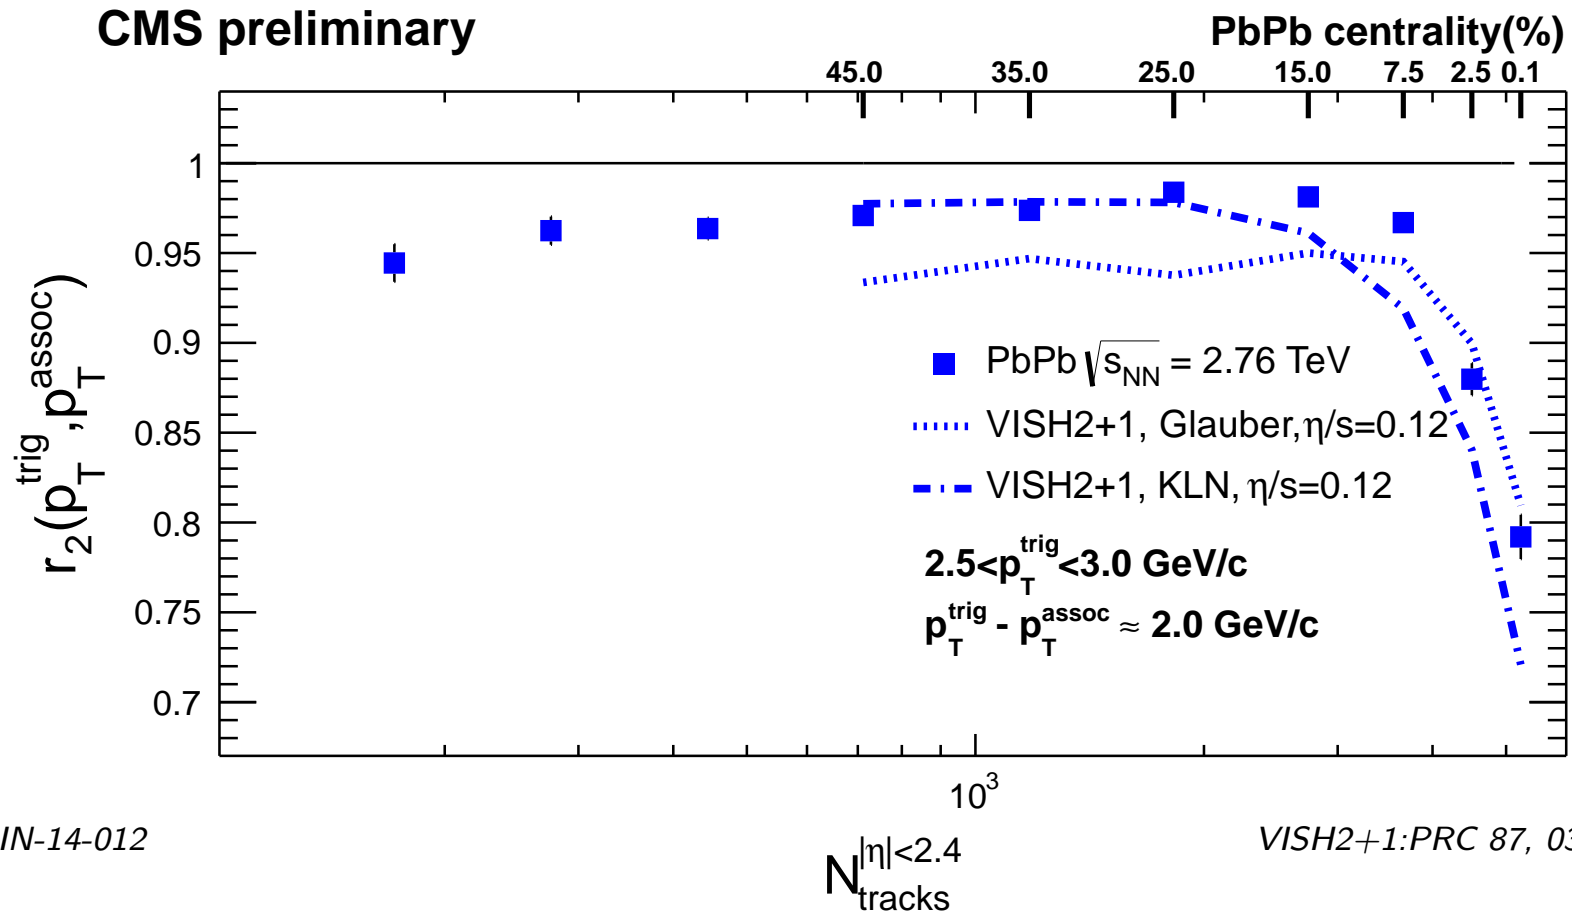

CMS PAS HIN-14-012

VISH2+1:PRC 87, 034913 (2013)

- ▶ The VISH2+1 model qualitatively gives a good description of CMS data for both Glb and KLN initial conditions
- ▶ Very roughly, both initial conditions are closest to the exp. data for $\eta/s=0.12$

r_2 multiplicity dependence

CMS PAS HIN-14-012

- ▶ The effect increases dramatically as the collisions become more central than 0-5%
- ▶ For the smaller centralities ($>5\%$), the effect is on the level of few percent, and is nearly independent of centrality
- ▶ Both initial conditions, qualitatively describe CMS data

r_3 multiplicity dependence

CMS PAS HIN-14-012

VISH2+1:PRC 87, 034913 (2013)

- ▶ No strong centrality dependence
- ▶ VISH2+1 qualitatively describes r_3

pPb RESULTS

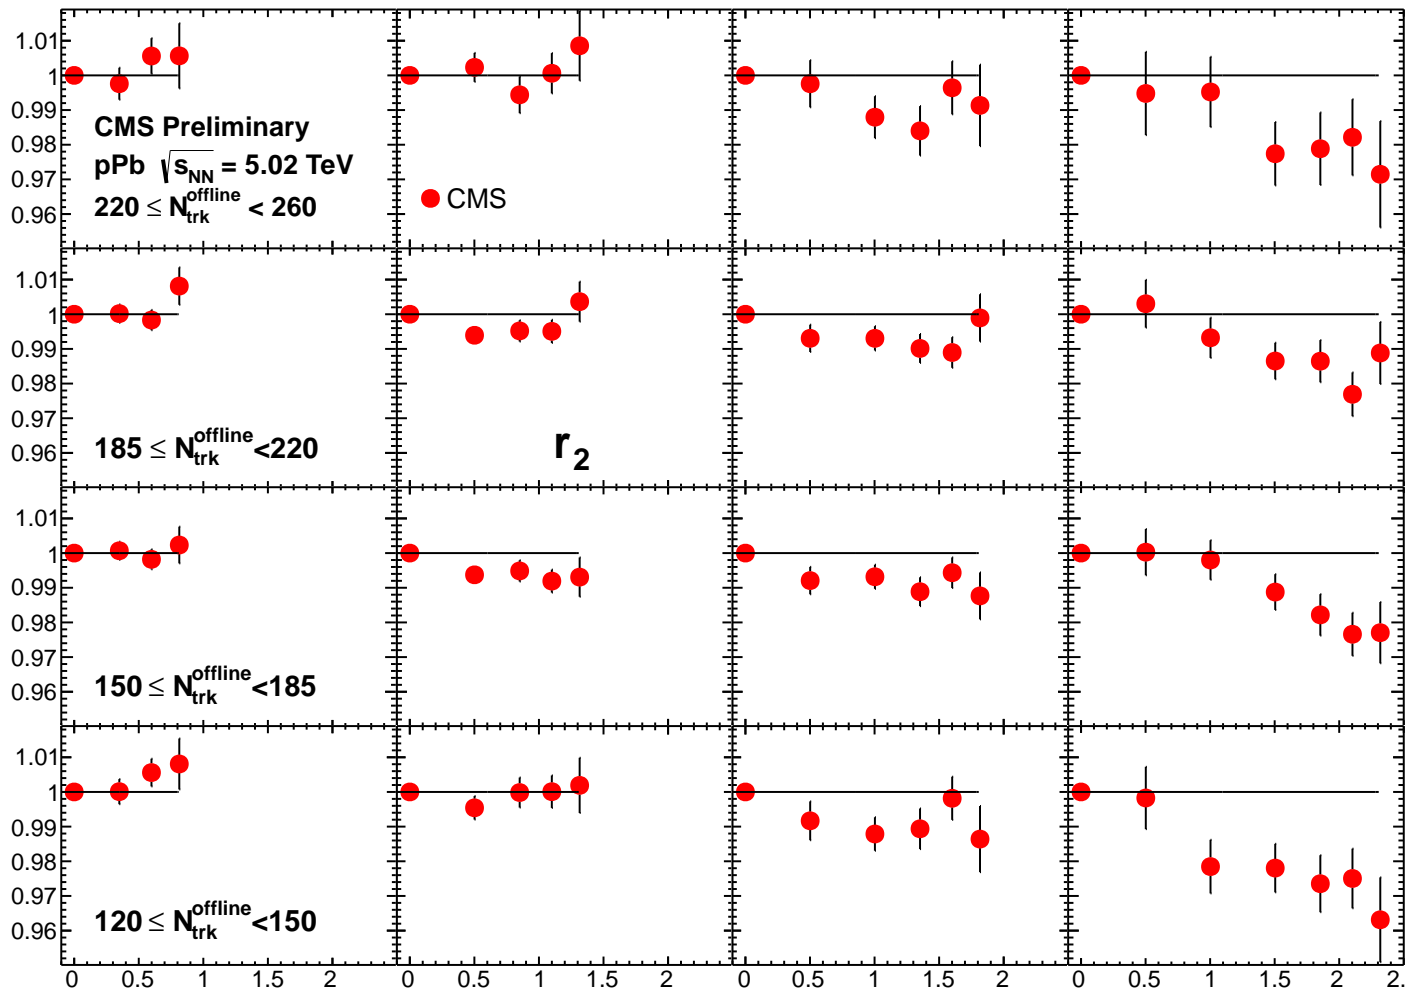

r_2 from high-multiplicity pPb

p_T^{trig}

$220 < N_{trk}^{offline} < 260$

1.0 GeV/c < p_T^{trig} < 1.5 GeV/c 1.5 GeV/c < p_T^{trig} < 2.0 GeV/c 2.0 GeV/c < p_T^{trig} < 2.5 GeV/c 2.5 GeV/c < p_T^{trig} < 3.0 GeV/c

- ▶ The effect increases with p_T^{trig} and $p_T^{trig} - p_T^{assoc}$
- ▶ Maximum: around 2-3%
- ▶ Nearly no dependence on multiplicity

$120 < N_{trk}^{offline} < 150$

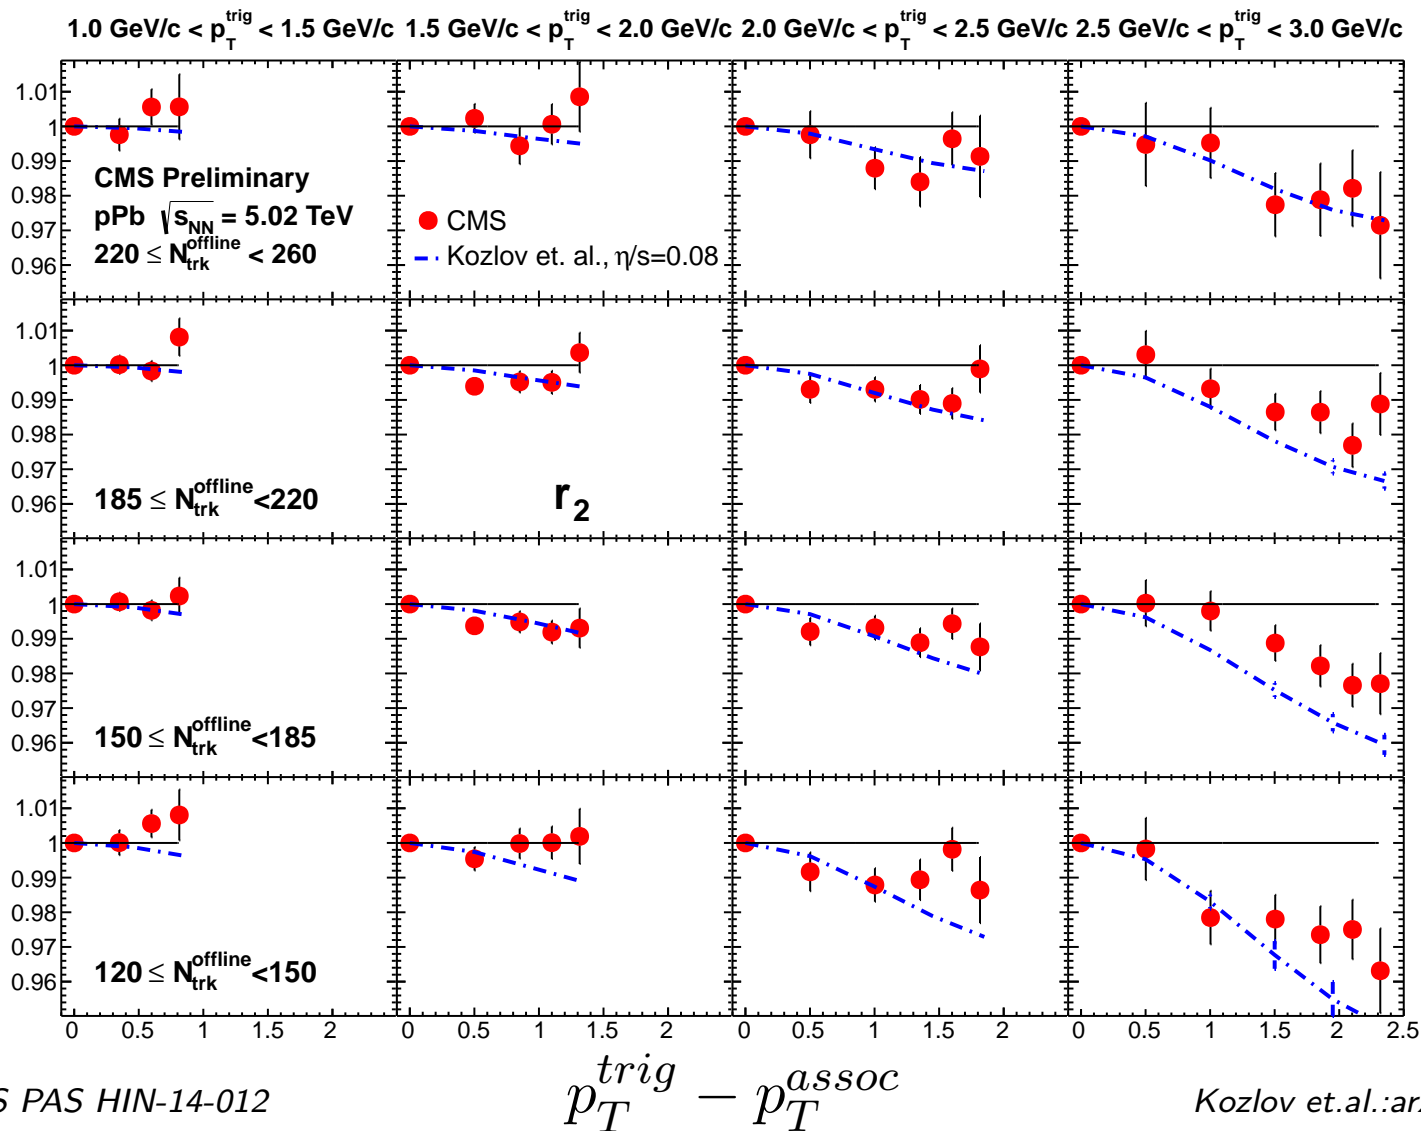

$p_T^{trig} - p_T^{assoc}$

Comparison: r_2 from high-multiplicity pPb with Kozlov et. al. hydro model

p_T^{trig}

$220 < N_{trk}^{offline} < 260$

► Kozlov et. al. hydro model qualitatively describes data

$120 < N_{trk}^{offline} < 150$

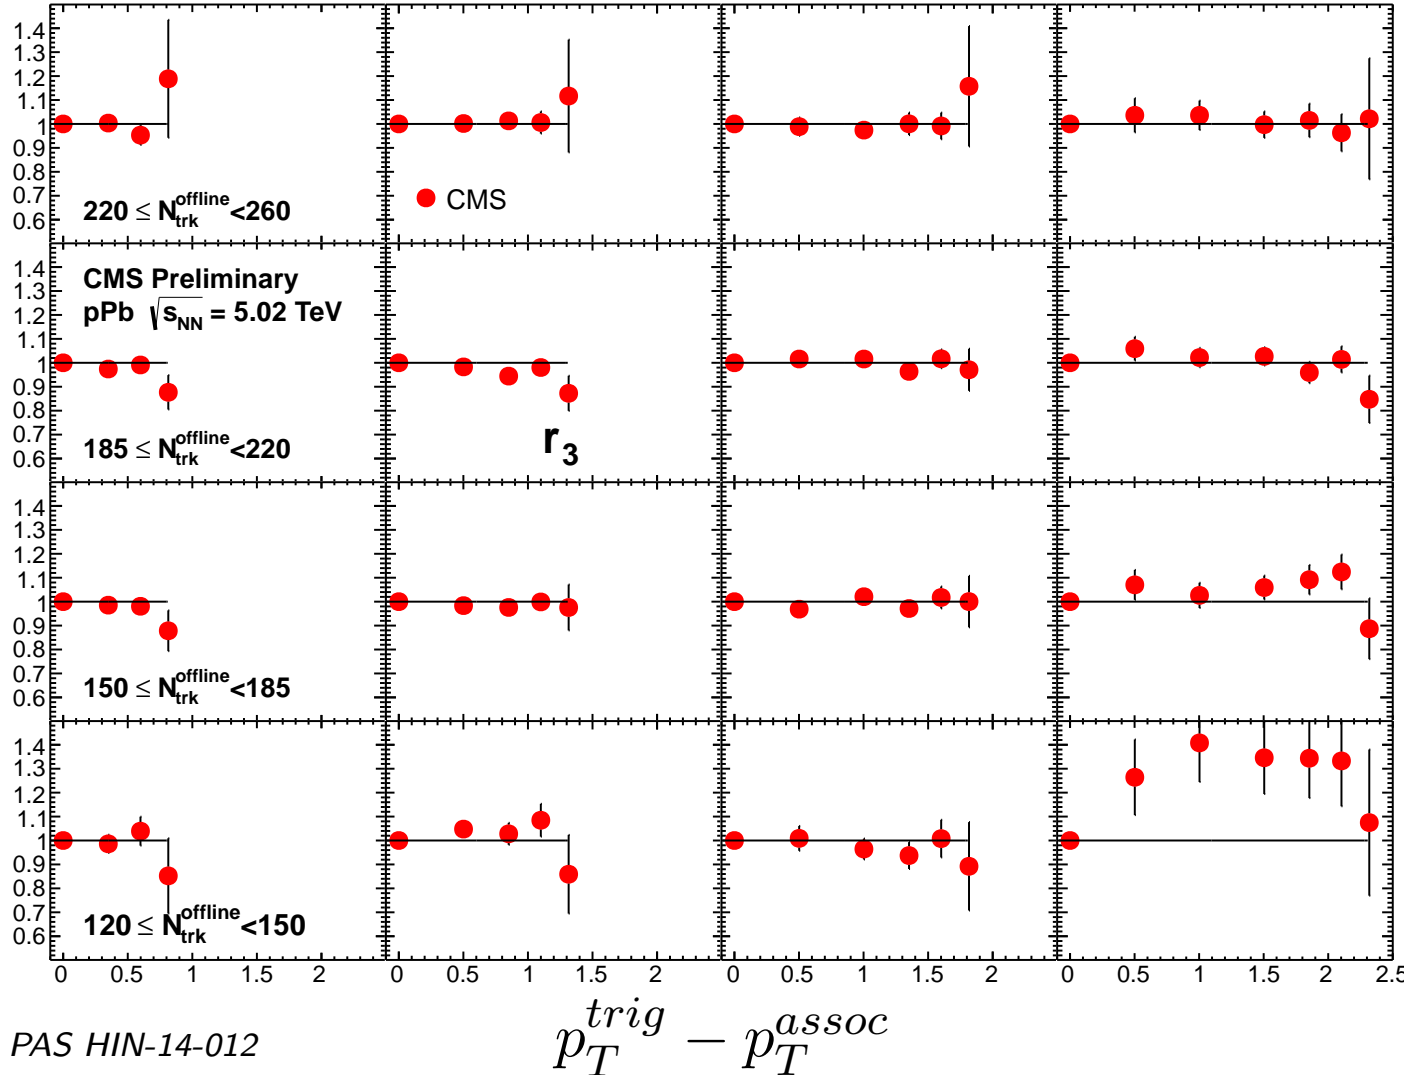

r_3 from high-multiplicity pPb

p_T^{trig}

$220 < N_{trk}^{offline} < 260$

1.0 GeV/c < p_T^{trig} < 1.5 GeV/c 1.5 GeV/c < p_T^{trig} < 2.0 GeV/c 2.0 GeV/c < p_T^{trig} < 2.5 GeV/c 2.5 GeV/c < p_T^{trig} < 3.0 GeV/c

- ▶ Better factorization for V_3
- ▶ A direct indication of non-flow effect seen in r_3 for the highest p_T^{trig} in lower multiplicity bins

$120 < N_{trk}^{offline} < 150$

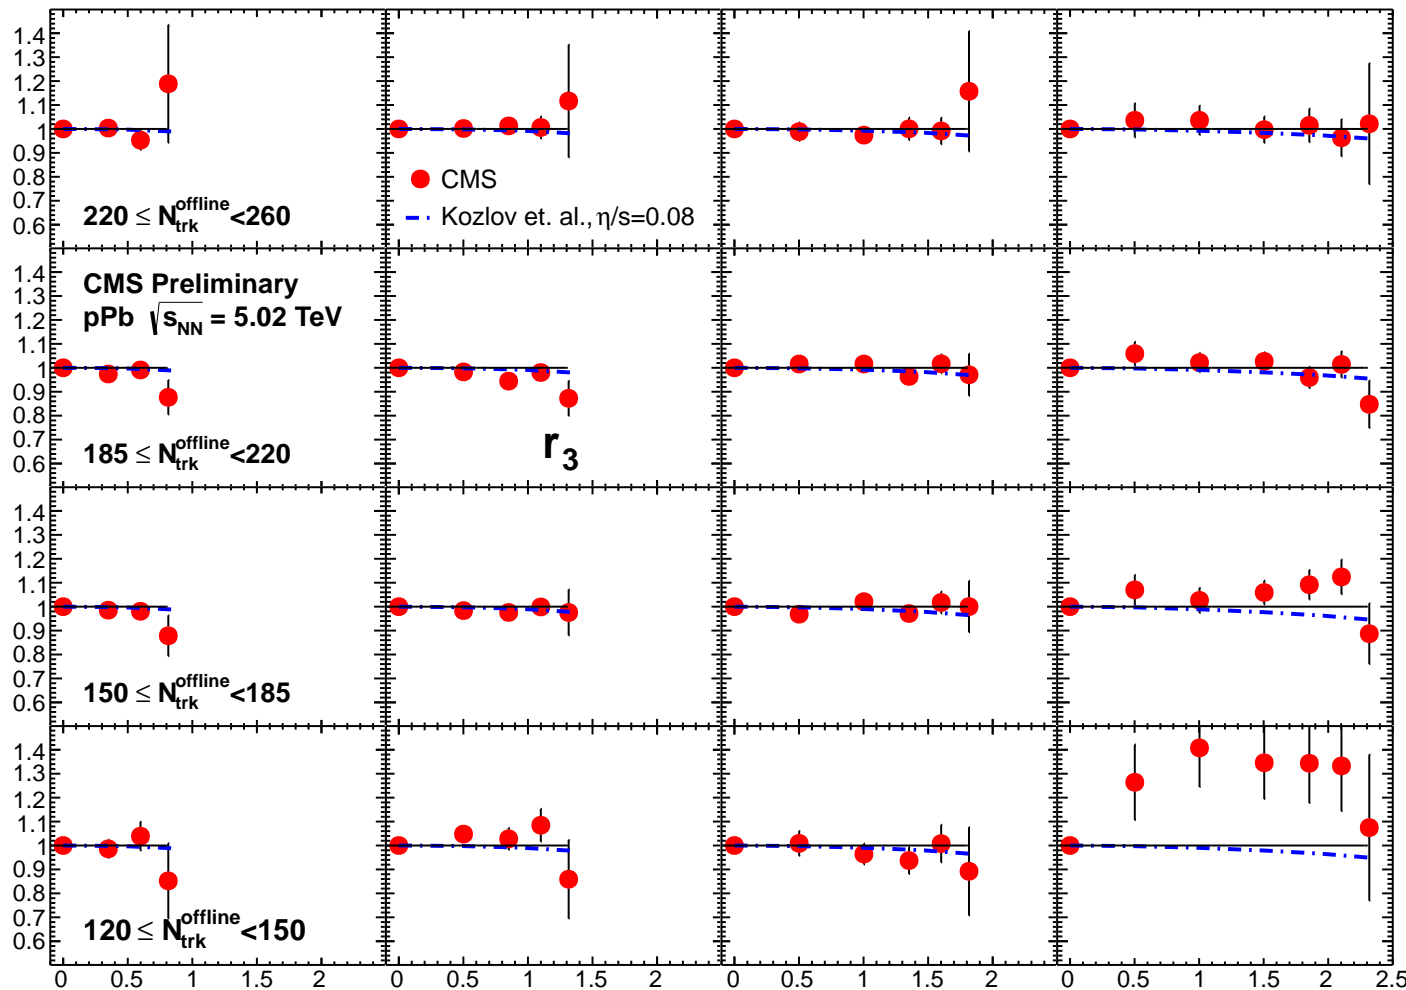

Comparison: r_3 from high-multiplicity pPb with Kozlov et. al. hydro model

$$p_T^{trig}$$

$$220 < N_{trk}^{offline} < 260$$

1.0 GeV/c < p_T^{trig} < 1.5 GeV/c 1.5 GeV/c < p_T^{trig} < 2.0 GeV/c 2.0 GeV/c < p_T^{trig} < 2.5 GeV/c 2.5 GeV/c < p_T^{trig} < 3.0 GeV/c

► Kozlov et. al. model qualitatively describes data except in lower multiplicity bins

$$120 < N_{trk}^{offline} < 150$$

$$p_T^{trig} - p_T^{assoc}$$

Kozlov et.al.:arXiv:1405.3976

CMS PAS HIN-14-012

r_2 comparison between high-multiplicity pPb and peripheral PbPb collisions

CMS PAS HIN-14-012

- ▶ The r_2 in peripheral PbPb is somewhat stronger w.r.t. high-multiplicity pPb
- ▶ The statistics in PbPb is ≈ 4 times smaller w.r.t. pPb
- ▶ The overall effect is small, on the level of 3- 5%
- ▶ The effect is very similar for both analyzed multiplicity intervals

r_2 multiplicity dependence

- ▶ The effect increases dramatically as the collisions become more central than 0 – 5%
- ▶ For the smaller centralities ($>5\%$), r_2 is on the level of few percent, and is nearly independent of centrality
- ▶ Both hydro models, qualitatively describe CMS data

- ▶ Compared to PbPb, there is strong dependence from centrality in pPb
- ▶ A non-flow effect seen in pPb for the highest p_T^{trig} in lower multiplicities
- ▶ VISH2+1 qualitatively describes r_3 in PbPb
- ▶ Kozlov et. al. hydro qualitatively describes r_3 for the highest multiplicities in pPb, but fails for lower multiplicities

Summary

- ▶ CMS measured factorization breaking of two-particle correlations in PbPb and pPb
- ▶ Strong effect in ultra-central PbPb
- ▶ 2-3% in pPb, comparable to PbPb at similar multiplicity
- ▶ Qualitatively or even semi-quantitatively consistent with hydro with p_T dependent event plane angle induced by initial-state fluctuations
