The background image shows a majestic mountain range with several peaks covered in white snow. The sky above is a vibrant, clear blue. In the foreground, there are some rocky, reddish-brown mountain ridges. A small, dark building or hut is visible on one of the ridges.

CERN Theory Retreat

CV

- 2002 - 2010:
 - Diploma and PhD in Karlsruhe
(advisor Ulrich Nierste)
- 2010 - 2013
 - PostDoc in Bern (Christoph Greub)
- 2013 – 2015
 - Marie Curie fellow at CERN
- Starting 2016:
 - Ambizione fellowship of the SNSF at the PSI

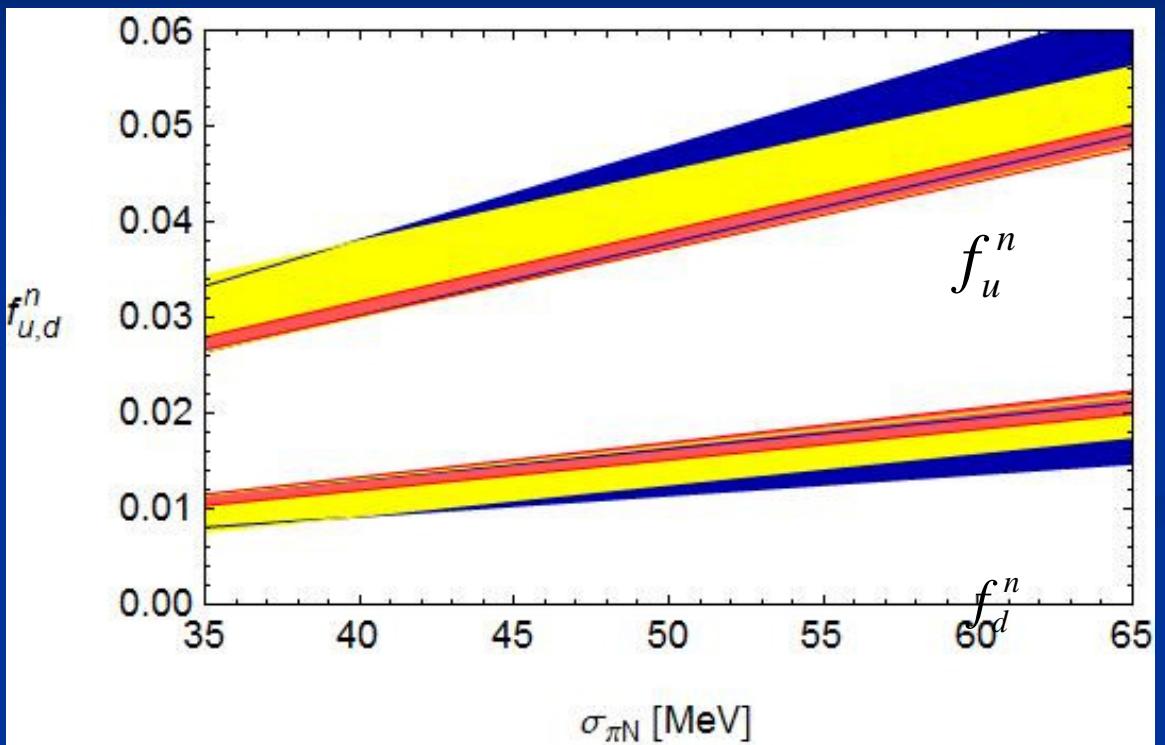

Research Interests

- Flavour Physics
- MSSM
 - Effective Higgs vertices
 - Chirally enhanced corrections
 - Radiative Flavour violation
- 2HDM
- Tauonic B decays
- Dark Matter
- EFT

Scalar quark couplings to the nucleon

A.C., M. Hoferichter, M. Procura arXiv:1312.4951

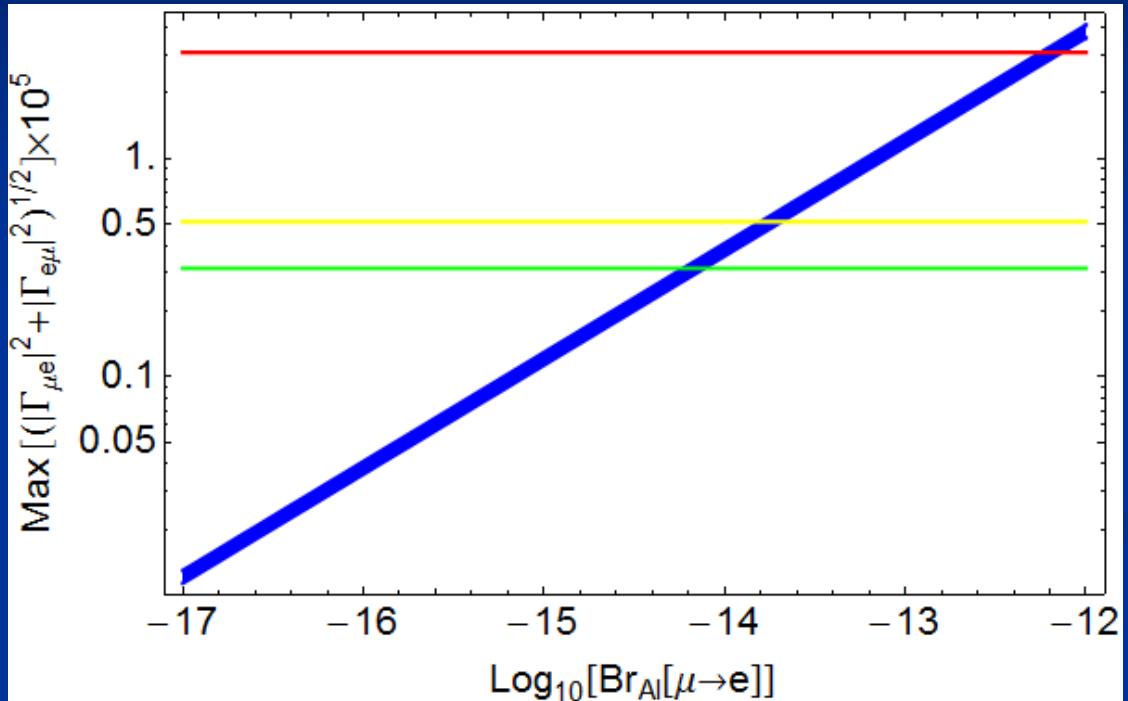

- TradITIONAL approach:
SU(3) chiral perturbation
- Better:
SU(2) chiral perturbation theory
and f_s from lattice
- Important for
 - DM direct detection
 - $\mu \rightarrow e$ conversion

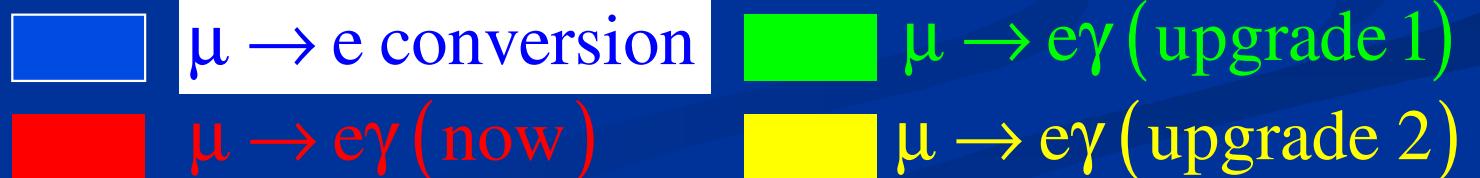

$\mu \rightarrow e$ conversion

A.C., M. Hoferichter, M. Procura arXiv:1404.7134

- Excellent experimental prospects:
 $\text{Br}[\mu \rightarrow e] < 10^{-17}$
- Sensitive to Higgs mediated Flavour violation

$\Gamma_{\mu e}$: μ - e - h^0 coupling

Effective Field Theory Approach to Dark Matter

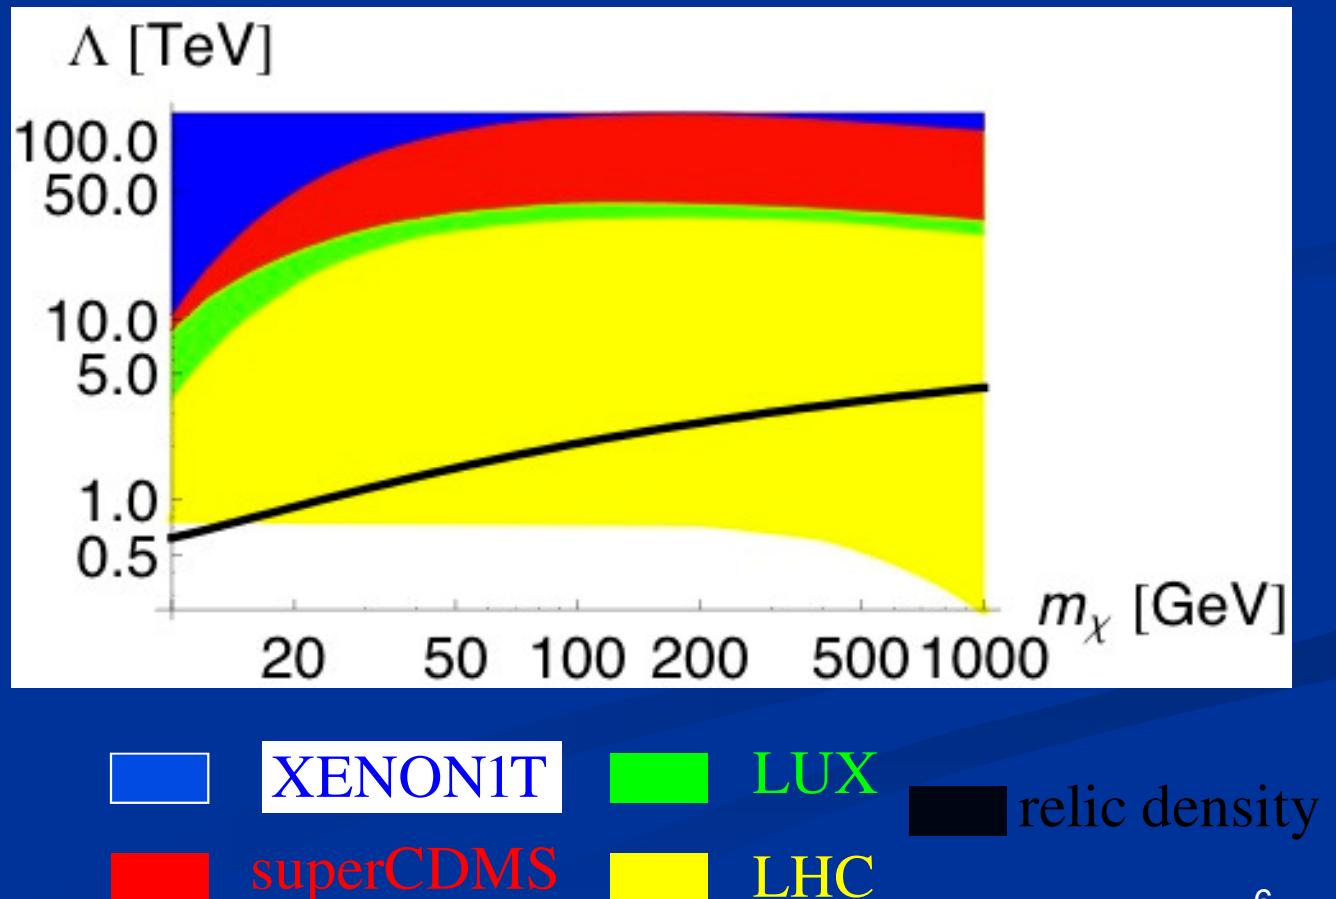

A.C., F. d'Eramo, M. Procura, arXiv:1402.1173

A.C., U. Haisch, arXiv:1408:5046

We assume that DM is:

- A SM singlet
- A Dirac fermion
- Impact of loop-effects
- Correlations with LHC searches

$$C_{qq}^{VA} = 1$$

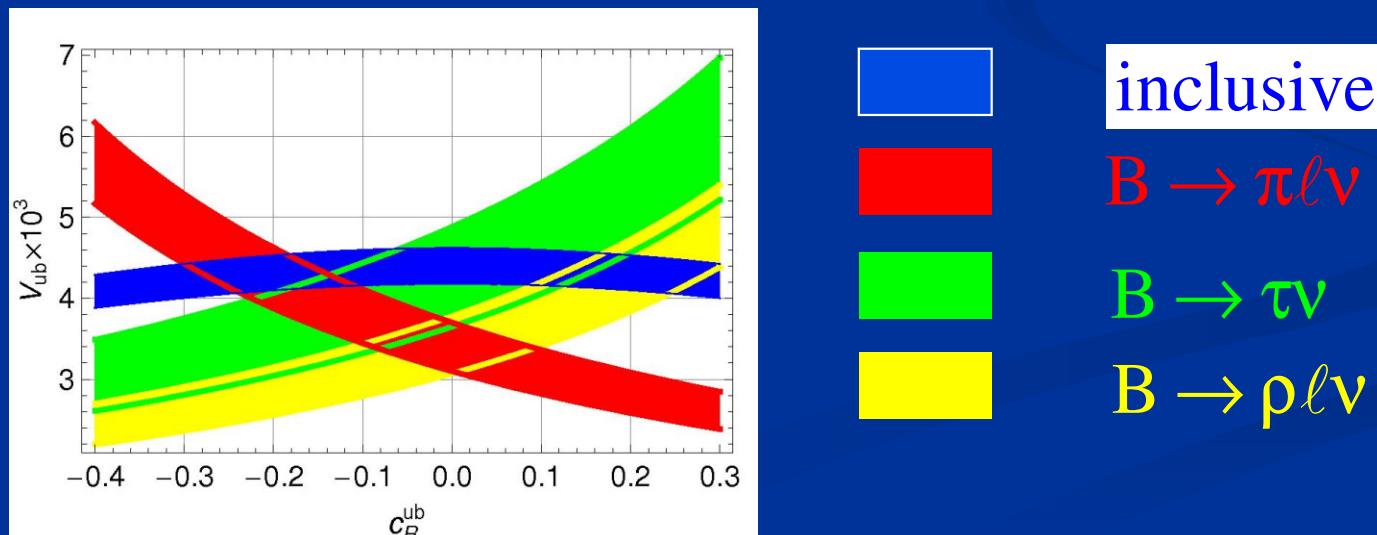

Effective Field Theory Approach to Flavour Physics

A.C., S. Pokorski, arXiv:1407.1320

A.C., J. Rosiek, S.Najjari, arXiv:1312:0634

- Lepton flavour-violation: 1-Loop predictions for all gauge invariant dim-6 operators
 - Determination of CKM elements
- The differences cannot be explained with NP

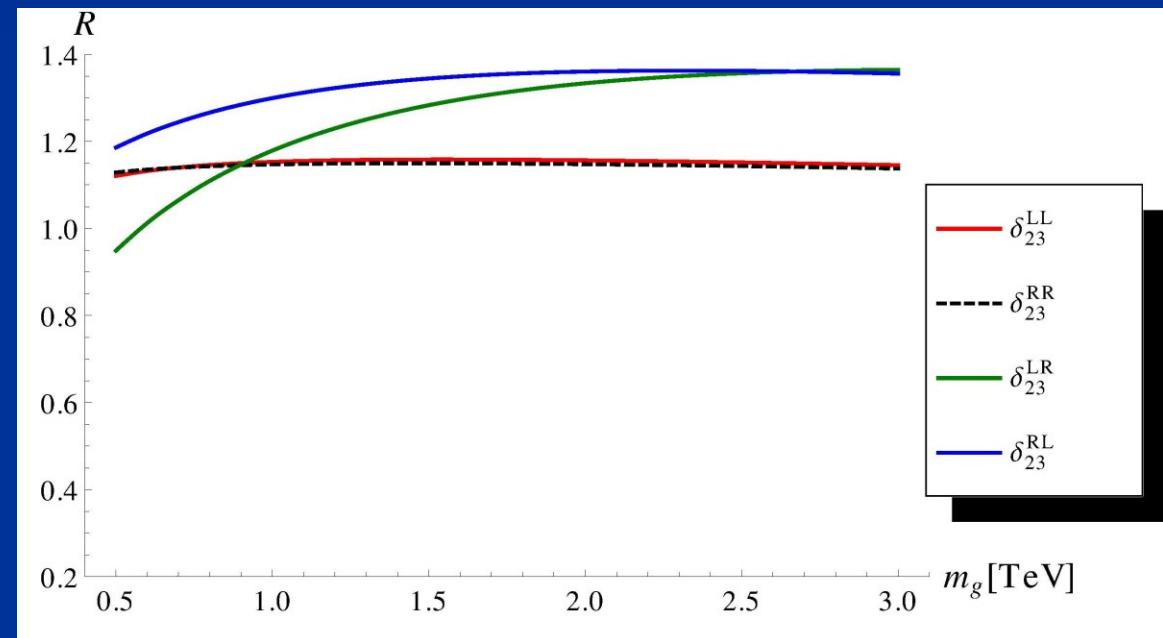

stop → charm+neutralino

J. Aebischer, A.C., C. Greub, arXiv:1410.4589

A.C., U. Haisch, L. Tunstall, in preparation

1-Loop SQCD corrections

- Shift between on-shell and $\overline{\text{DR}}$ mass very important
- Large corrections for trilinear terms

- Significant impact on the LHC bounds from $\tilde{t} \rightarrow W b \tilde{\chi}^0$
→ Very light stop masses allowed in non-minimal FV
