www.4thconcept.org

Design Guidelines

- Light -> no iron
- Alternative to other Concepts
 - No PFA for Calorimetry
 - No TPC for Central Tracking
 - No range-based Muon Detector
- Low material budget in front of the Calorimeter
- Open mind toward the choice of technology

Detectors Comparison

	ILD	SiD	4-th
VTX	Si-pixels	Si-pixels	Si-pixels
Tracker	TPC + Si-strip	Si-strip	DC with Clust. Counting
Calorimeter	PFA Rin=2.1m	PFA Rin=1.27m	Compensating Rin=1.5m
B	3-4T	5T	3.5T/-1.5T No return yoke
BR ²	10.2-13.2 Tm ²	8.1 Tm ²	(non-PFA)
E _{store}	1.6-1.6 GJ	1.4 GJ	2.7 GJ
Size	R=6.0-7.2m Z =5.6-7.5m	R=6.45m Z =6.45m	R=5.5m Z =6.4m

4th Concept Detector

1. Vertex Detector 20-micron pixels (based on SiD design)
2. Drift Chamber with He gas and Cluster Counting
3. Double-readout calorimeter as alternative to PFA
4. Muon dual-solenoid spectrometer

Motivations

- **He-based Drift Chamber with Cluster Counting**
 - Continuous tracking and seeding from Central Tracker
 - Lowest material budget
 - $\mathcal{O}(10^4)$ channels
 - Consolidated technology (i.e. Kloe)
 - Cost
- **Dual/Triple readout calorimeter**
 - Resolution doesn't depend on Energy
 - $\mathcal{O}(10^4)$ channels
 - Cost
- **Dual Solenoid Muon Spectrometer**
 - No iron
 - Precise determination of momentum
 - Tail catcher
 - Independent calibration for the calorimeter (i.e. via $\mu \rightarrow \mu\gamma$)

The 4th Concept Tracking Systems

Beam Pipe and VXD layout

- Beam Pipe:
 - 400 μm Be
 - 25 μm Ti
- VXD: SiD/4th Concept
 - 5 barrel layers (96 ladders) x 4 endcaps (96 sectors)
 - 20 μm x 20 μm pixel size (10^9 pixels)
 - Detector support: 100 μm CarbonFiber
 - Si modules: 100 μm Si

Material Budget

- Beam Pipe: 0.18% X/X_0
- VXD (including support & electr.): 0.8% X/X_0

October 15th, 2008

Drift Chamber Layout

Under test
PET Filled wires 25 μm
Boron fiber Endplates

Vessel: 18-150 cm with spherical Endcaps

Active volume: 20-147 cm

Hexagonal cells f.w./s.w.=2:1

cell height: 1.00 ÷ 1.20 cm

cell radius: 4.5 ÷ 6.00 mm

(max. drift time < 300 ns !)

27 superlayers, in 270 rings
10 cells each (7.5 in average)
at alternating **stereo angles**

$\pm 72 \div \pm 180$ mrad

(constant stereo drop = 2 cm)

78000 sense w. 20 μm W

156000 field w. 80 μm Al

“easy” t-to-d $r(t)$ (few param.)

>90% sampled volume

4th Concept ILC Drift Chamber

Layout and assembly technique

TOTAL = $0.028 X_0$

Gas = $0.0015 X_0$
Wires = $0.0040 X_0$

Length:

3.4 m at $r = 20$ cm

3.0 m at $r = 147.0$ cm

Spherical end plates:

C-f. 12 mm + $30 \mu\text{m}$ Cu
($0.047 X_0$)

Inner cylindrical wall:

C-f. 0.2 mm + $30 \mu\text{m}$ Al
($0.001 X_0$)

Outer cylindrical wall:

C-f./hex.cell. sandwich
held by 6 unidir. struts
($0.020 X_0$)

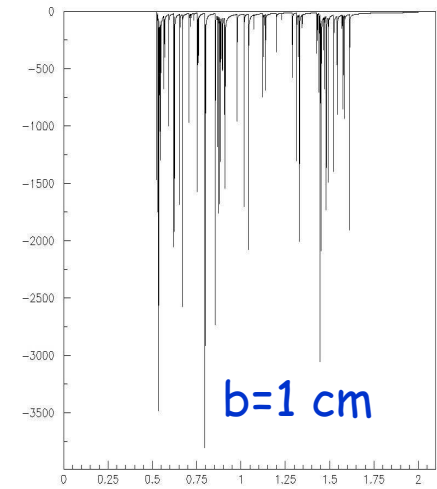

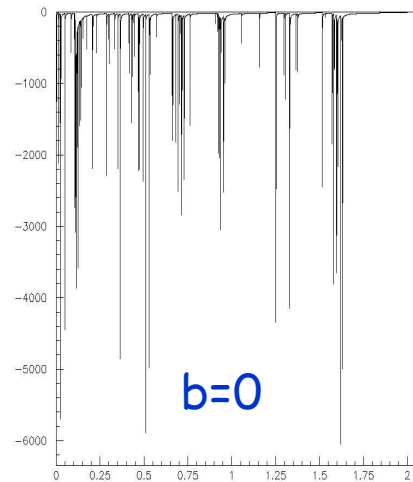

Retaining ring

Stiffening ring

CLUster COUnting

MC generated events:
2cm diam. drift tube
gain = few $\times 10$
gas: 90%He-10% iC_4H_{10}
no electronics simulated
vertical arbitrary units

cosmic rays triggered
by scintillator telescope
and readout by:
8 bit, 4 GHz, 2.5 Gsa/s
digital sampling scope
through a 1.8 GHz, $\times 10$
preamplifier

2007 INTERNATIONAL
LINEAR COLLIDER WORKSHOP
May 30 until June 3, 2007

F. Grancagnolo. --- CLUCOU for ILC ---

Material Budget at $\theta = 90^\circ$ ($\theta = 0^\circ$ for endcaps/endplates)

- Beam Pipe: 0.18% X/X_0
- VXD:
 - Detector & support: 0.8% X/X_0

Drift Chamber

- Gas [He-C₄H₁₀/90-10]: 0.15%
- Wires: 0.4%
- Vessel:
 - Inner wall: 0.1% X/X_0
 - Outer wall: 2% X/X_0
 - Endcaps (wires, pads, electronics & services included): 8% X/X_0

The 4th Concept Dual/Triple Readout Calorimeter

October 15th, 2008

CLIC08 - C. Gatto

14

Dual Readout Calorimetry

Total calorimeter energy: use two measured signals and two, energy-independent, calibration constants

$$E_{HCAL} = \frac{\eta_S \cdot E_S \cdot (\eta_C - 1) - \eta_C \cdot E_C \cdot (\eta_S - 1)}{\eta_C - \eta_S}$$

Dual Readout Calorimetry

Total calorimeter energy: use two measured signals and two, energy-independent, calibration constants

$$E_{HCAL} = \frac{\eta_s \cdot E_s \cdot (\eta_c - 1) - \eta_c \cdot E_c \cdot (\eta_s - 1)}{\eta_c - \eta_s}$$

Dual Readout Calorimetry

Total calorimeter energy: use two measured signals and two, energy-independent, calibration constants

$$E_{HCAL} = \frac{\eta_s \cdot E_s \cdot (\eta_c - 1) - \eta_c \cdot E_c \cdot (\eta_s - 1)}{\eta_c - \eta_s}$$

$$\eta_c = \left(\frac{e}{h}\right)_c \quad \eta_s = \left(\frac{e}{h}\right)_s$$

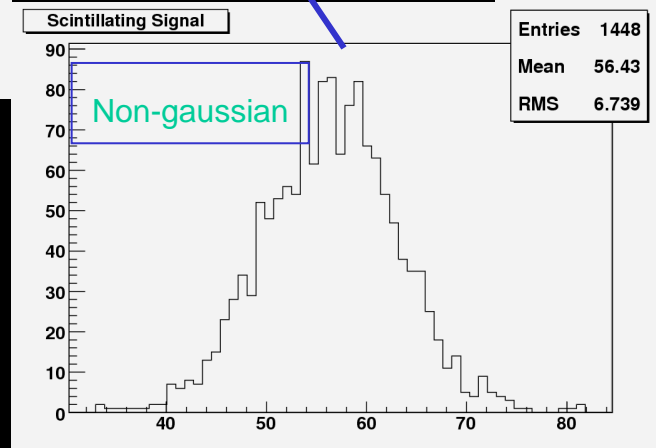

From calibration

The 4th Concept Muon Spectrometer

October 15th, 2008

CLIC08 - C. Gatto

25

Dual Solenoid B-field & Muon Spectrometer

radius 2.3 cm
 filled with 90% He – 10% iC_4H_{10} @ NTP
 gas gain few $\times 10^5$
 total drift time 2 μ s
 primary ionization 13 cluster/cm \Rightarrow \approx 20 electrons/cm total
 both ends instrumented with:

- > 1.5 GHz bandwidth
- 8 bit fADC
- > 2 Gsa/s sampling rate
- free running memory

for a

- fully efficient timing of primary ionization: **cluster counting**
- accurate measurement of longitudinal position with **charge division**
- particle identification with dN_{cl}/dx

Barrel:

31500 tubes
 21000 channels
 840 cards

End caps:

8640 tubes
 9792 channels
 456 cards

Total:

40140 tubes
 30792 channels
 1296 cards

4th Concept Detector Performance Studies

October 15th, 2008

CLIC08 - C. Gatto

29

4th Concept Software Strategy: ILCroot

- **CERN** architecture (based on **Alice's Aliroot**)
- Full support provided by Brun, Carminati, Ferrari, et al.
- Uses **ROOT** as infrastructure
 - All ROOT tools are available (I/O, graphics, PROOF, data structure, etc)
 - Extremely large community of users/developers
- TGenerator for events generation
- Virtual Geometry Modeler (VGM) for geometry
- Based on **Virtual Montecarlo**
 - Virtual MC provides a virtual interface to Monte Carlo
 - The concrete Monte Carlo (Geant3, Geant4, Fluka) is selected and loaded at run time
- Could it ever evolve into a general purpose entity for the HEP community (as ROOT)?
- Growing number of experiments have adopted it: Alice, Opera, CMB, (Meg), Panda, 4th Concept
- **Six MDC have proven robustness, reliability and portability**

**Do not Reinvent the wheel
Concentrate on Detector studies and Physics**

Detectors in ILCroot

- VTX Detectors: 4th Concept, SiD, FTD
- Central Trackers: TPC, Drift Chamber (3 versions), Si-Strips (SID01), SPT (Pixel Tracker)
- HCAL: DREAM (3 versions)
- ECAL: 4th Concept (2 versions)
- Muon Spectrometer: 4th Concept
- **Total: 10 subdetectors (15 versions),
most of them with full simulation**

Event Display in ILCroot

$e^+e^- \rightarrow H^0 H^0 Z^0$

VXD Single Cluster Resolution with Full Digitization (single track)

Effects on Track Reconstruction of 1 BX Background

- Geant threshold: 10 keV
- VTX threshold: 3000 e⁻

- Reconstruction efficiency for ttbar->6jets in VTX+DCH is mostly unaffected
- Fake clusters: 0.4% ->0.7%

- VTX performance depends heavily on the technology chosen for the Central Tracker
- Careful studies with multiple BX's are required
- Geant3 and Fluka not adequate for such studies

$t\bar{t} \rightarrow 6$ jets events

Cer Energy vs Scint Energy

70 GeV π^0 in ECAL+HCAL

Resolution for π^0 in ECAL+HCAL

ECAL+HCAL Issues

- Preliminary studies on ECAL+HCAL for hadronic showers and jets
- Making ECAL and HCAL working together is not trivial
- Simple merging of the two showers is not working
- Need a more involved calibration
- Otherwise need to give up the crystals or make a purely crystal calorimeter

Muon Spectrometer Performance

- No combined information with tracking yet
- 4-jets finding efficiency: 95%

Study by A. Mazzacane

October 15th, 2008

CLIC08 - C. Gatto

63

Summary of Detector Studies

- Resolutions with multi-jets are dominated by multiple scattering in VTX + Central Tracker
- Redundancy of measurements and seeding in central tracker is fundamental for good/safe performance
- Small drift cell (drift time \leq time between BXs) relax the requirements on the VTX
- VTX resolution likely not an issue (for pixels about $20 \mu\text{m} \times 20 \mu\text{m}$)
- VTX material budget of $1\% X/X_0$ is OK
- Energy resolution in Triple Readout Calorimeter is comparable with PFA
- Dual Solenoid Muon Spectrometer nice complement to Tracking + Calorimeter

Status and Perspectives

- Detector R&D is performed by independent collaborations (CLUCOU, DREAM, SiLC, etc)
- Most critical issues have been pinpointed:
 - DCH needs Si in fwd region: -> CLUCOU + SiLC
 - Crystal Calorimeter -> Collaboration with FNAL (A. Para)
- Software framework (ILCroot) runs smoothly at FNAL. It allows quick test of new ideas and efficient optimization work
- It is continuously upgraded, with newer versions of the subdetectors
- Present effort is for the Letter of Intent (March 2009)
- **We suffer from shortage of funding rather than human resources**

Backup slides

October 15th, 2008

CLIC08 - C. Gatto

66

The Virtual Montecarlo Concept

- Virtual MC provides a virtual interface to Monte Carlo
- It decouples the dependence of a user code on a concrete MC
- It allows to run the same user application with all supported Monte Carlo programs
- The concrete Monte Carlo (Geant3, Geant4, Fluka) is selected and loaded at run time
- Choose the optimal Montecarlo for the study

Pulls (full digitization)

$e^+e^- \rightarrow Z_0 H_0 \rightarrow \mu^+ \mu^- X$
+ $e^+e^- \rightarrow Z_0 Z_0 \rightarrow \mu^+ \mu^- X$ background
[$E_{cm}=230$]

- Momentum spectrum for generated tracks entering the central tracker region
- Standard benchmark channel
- Used as reference with existing analyses

$e^+e^- \rightarrow W^+W^- \rightarrow 4\text{jets}$ $E_{\text{cm}}=350$

- W^+ and W^- generated mostly in the forward/backward direction
- Channels with soft charged tracks emitted in the forward direction

$e^+e^- \rightarrow t\bar{t}$: Pt Spectrum

 $2 \text{ jets} + 2 \text{ muons}$
 with DCH

$E_{CM} = 230 \text{ GeV}$

- Hits per cell vs layer

- Occupancy vs layer

VXD SDigitization

- Follow the path of the track inside the silicon in steps of 1 μm
- Per each step:
 - convert the energy deposited into charge
 - spreads the charge asymmetrically across several pixels:

$$f(x, z) = \text{Errf}(x_{step}, z_{step}, \sigma_x, \sigma_z)$$

$$\sigma_x = \sqrt{T \cdot k / e \cdot \Delta l / \Delta V \cdot step}$$

$$\Delta l = \text{Si thickness}, \quad \Delta V = \text{bias voltage}, \quad \sigma_x = \sigma_x \cdot fda$$

- Simulate capacitive pixel coupling by switching on nearby pixels
- Add random noise
- Simulate electronic threshold

Clusterization For VXD

- Create a initial cluster from adjacent pixels (sidewise only)
- subdivide the initial cluster in smaller $N \times N$ clusters (to be optimized)
- Kalman filter picks up the best clusters

SDigitization Parameters

- Size Pixel X = 20 μm
- Size Pixel Z = 20 μm
- Eccentricity = 0.85 (fda)
- Bias voltage = 18 V volts
- cr = 0% (coupling probability for row)
- cc = 4.7% (coupling probability for column)
- threshold = 3000 Electrons
- electronics = 0 (electronic noise)

SDigitization in Strips Detector

- Get the Segmentation Model for each detector module (allows for different segmentations)
- Load background hits from file (if any)
- Loop on the hits and create a segment in Si in 3D
 - Step inside the Si in equal size increments
 - Compute Drift time to p-side and n-side:
$$\text{tdrift}[0] = (y + (\text{seg} \rightarrow \text{Dy}()) * 1.0\text{E-}4) / 2 / \text{GetDriftVelocity}(0);$$
$$\text{tdrift}[1] = ((\text{seg} \rightarrow \text{Dy}()) * 1.0\text{E-}4) / 2 - y / \text{GetDriftVelocity}(1);$$
 - Compute diffusion constant:
$$\text{sigma}[k] = \text{TMath}::\text{Sqrt}(2 * \text{GetDiffConst}(k) * \text{tdrift}[k]);$$
 - integrate the diffusion gaussian from -3σ to 3σ
 - Charge pile-up is automatically taken into account

SDigitization in Strips (cont'd)

- Add gaussian electronic noise per each side separately: $s/n = 20$
- Add coupling effect between nearby strips
 - different contribution from left and right neighbours
 - Proportional to nearby signals (B-field effect)
- Threshold = 3 x noise

Clusterization in Strip Detector

- Create an initial cluster from adjacent strips
- Separate into Overlapped Clusters
 - Look for through in the analog signal shape
 - Split signal of parent clusters among daughter clusters
- Intersect stereo strips to get Recpoints from CoG of signals (and error matrix)
- Kalman filter picks up the best Recpoints

The Parameters for the Strips

- Strip size (p, n): 50 mm
- Stereo angle (p-> 17.5 mrad, n->17.5 mrad)
- Ionization Energy in Si = 3.62E-09
- Hole diffusion constant (= 11 cm²/sec)
- Electron diffusion constant (= 30 cm²/sec)
- v_{drift}^P (=0.86E+06 cm/sec) , v_{drift}^N (=2.28E+06 cm/sec)
- Calibration constants
 - Gain
 - ADC conversion (1 ADC unit = 2.16 KeV)
- Coupling probabilities between strips (p and n)
- σ of gaussian noise (p AND n)
- threshold

DCH SDigitization (in progress)

- Follow the path of the tracks inside the cell
- Per each deposited energy step:
 - convert the energy deposited into charge
 - Drift charge toward sense wire using Magboltz parameters
 - Add charge to FADC corresponding channel
- Add random noise
- Simulate electronic threshold

Clusterization For DCH (Cluster Counting)

- Clusterization is done per cell
- Shape analysis of FADC count
- Returns as many recpoints as the number of recognized clusters (max 2)

Tracking Algorithm (for TPC and DCH)

- Primary TPC/DCH seeding: looks for tracks with 20 hits (pads and/or μ megas) apart + beam constraint
- Secondary TPC/DCH seeding: looks for tracks with hits in layer 1, 4 and 7 (no beam constraint)
- **Parallel Kalman Filter** then initiated:
 - 1st step: start from TPC/DCH fit + prolongation to VXD (add clusters there)
 - 2nd step: start from VXD, refit trough TPC/DCH + prolongation to MUD
 - 3rd step: start from MUD and refit inword with TPC + VXD
- Final step: isolated tracks in VXD (see next slide) and in MUD*
- **Kinks and V0** fitted during the Kalman filtering
- All passive materials taken into account for MS and dEdx corrections

*not yet implemented

VXD Standalone Tracker

- Uses Clusters leftover from Parallel Kalman Filter
- **Requires at least 4 hits to build a track**
- Cluster finding in VXD in two steps
 - Step 1: look for 3 RecPoints in a narrow row or 2 + the beampoint.
 - Step 2: prolongate to next layers each helix constructed from a seed.
- After finding clusters, all different combination of clusters are refitted with the Kalman Filter and the tracks with lowest χ^2 are selected.
- Finally, the process is repeated attempting to find tracks on an enlarged road constructed looping on the first point on different layers and all the subsequent layers.
- In 3.5 Tesla B-field $\rightarrow P_t > 20$ MeV

$e^+e^- \rightarrow W^+W^-$
 $\rightarrow 4$ jets
with DCH
 $E_{CM} = 500$ GeV
