- Introduction
- E15 experimental
  - Set up
  - Detector Performance
- Analysis result
  - Semi-inclusive  ${}^3\text{He}(\text{K}^-, \text{n})$
  - Exclusive spectrum
  - ${}^3\text{He}(\text{K}^-, \text{d})$  analysis
- Summary

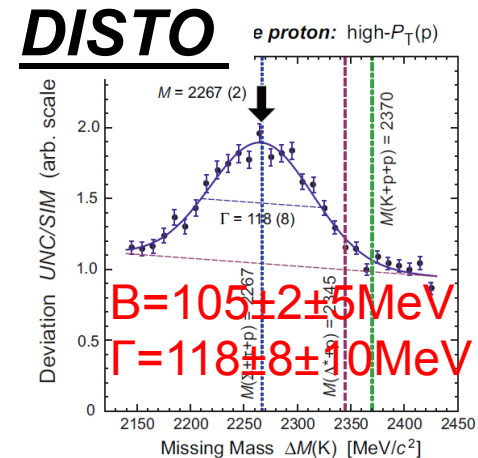

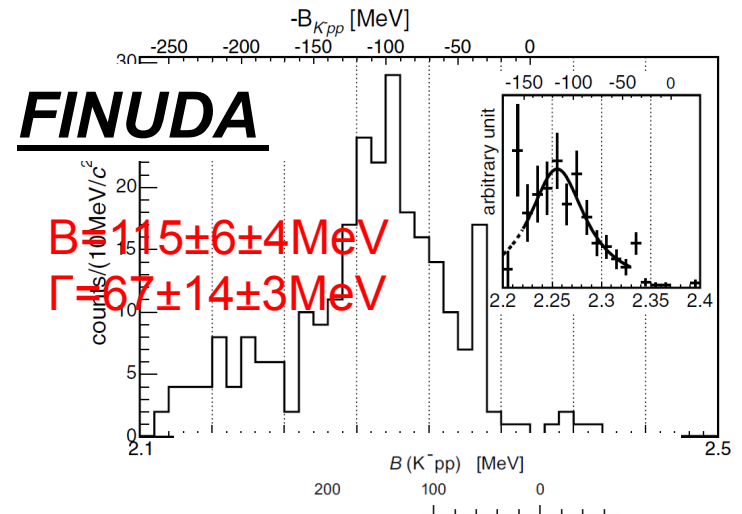

# Introduction

- We know  $\bar{K}N$  interaction is strongly attractive.
- A deeply kaonic nucleus may be formed when anti-kaon is embedded in nucleus.
- $K^-pp$  is the lightest one.

Y. Akaishi & T. Yamazaki, Phys. Rev. C **65** (2002) 044005.

Y. Akaishi & T. Yamazaki, Phys. Lett. B **535** (2002) 70.

# E15 Experiment

$K^-$  1 GeV/c  $^3\text{He}$

Reaction

$K^-pp$

+

Missing Mass Spectroscopy

Neutron momentum measured by TOF.

Invariant Mass Reconstruction from decay particles detected by CDS

NC

15 m

3

# K1.8BR spectrometer [Jun. 2012]

# CDS Performance

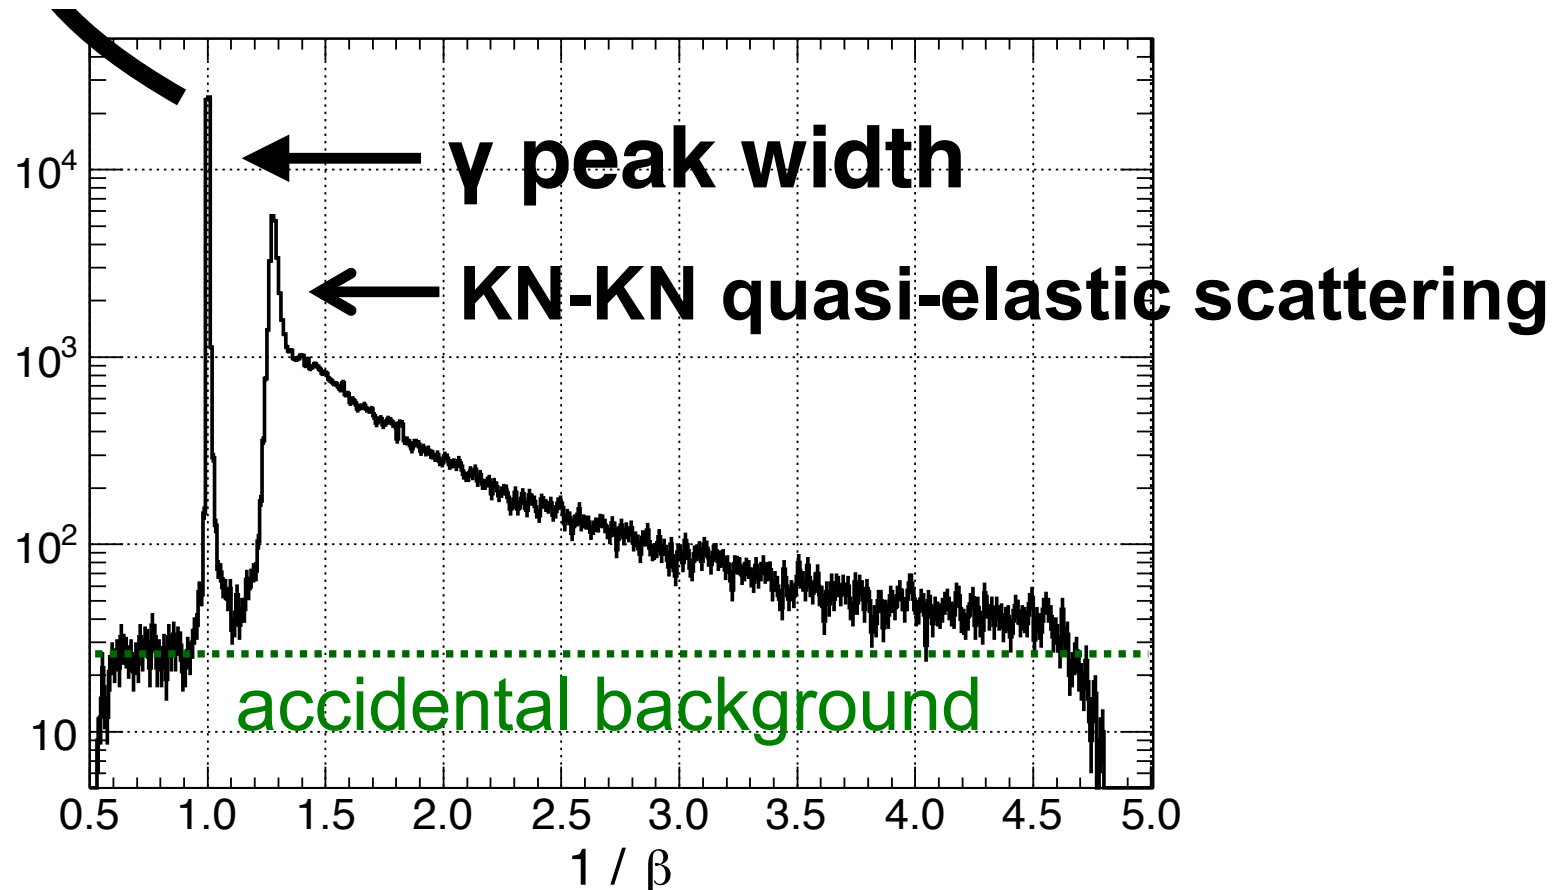

CDC: Drift Chamber  
 CDH: Hodoscope  
 Magnet: 0.7T  
 Cover 60% of the solid angle.

**Design performance was achieved!!**

# NC Performance

$S/N \sim 100$  @ QF neutron peak

→ Offline threshold is 8 MeVee

$\sigma_{\text{TOF}} \sim 160 \text{ ps}$  @  $\gamma$

→  $\sigma_{\text{MM}} \sim 10 \text{ MeV}/c^2$  at the interested region

# J-PARC E15 1<sup>st</sup> stage physics run

## Accumulated data

w/ liquid helium-3 target: ~1% of original proposal

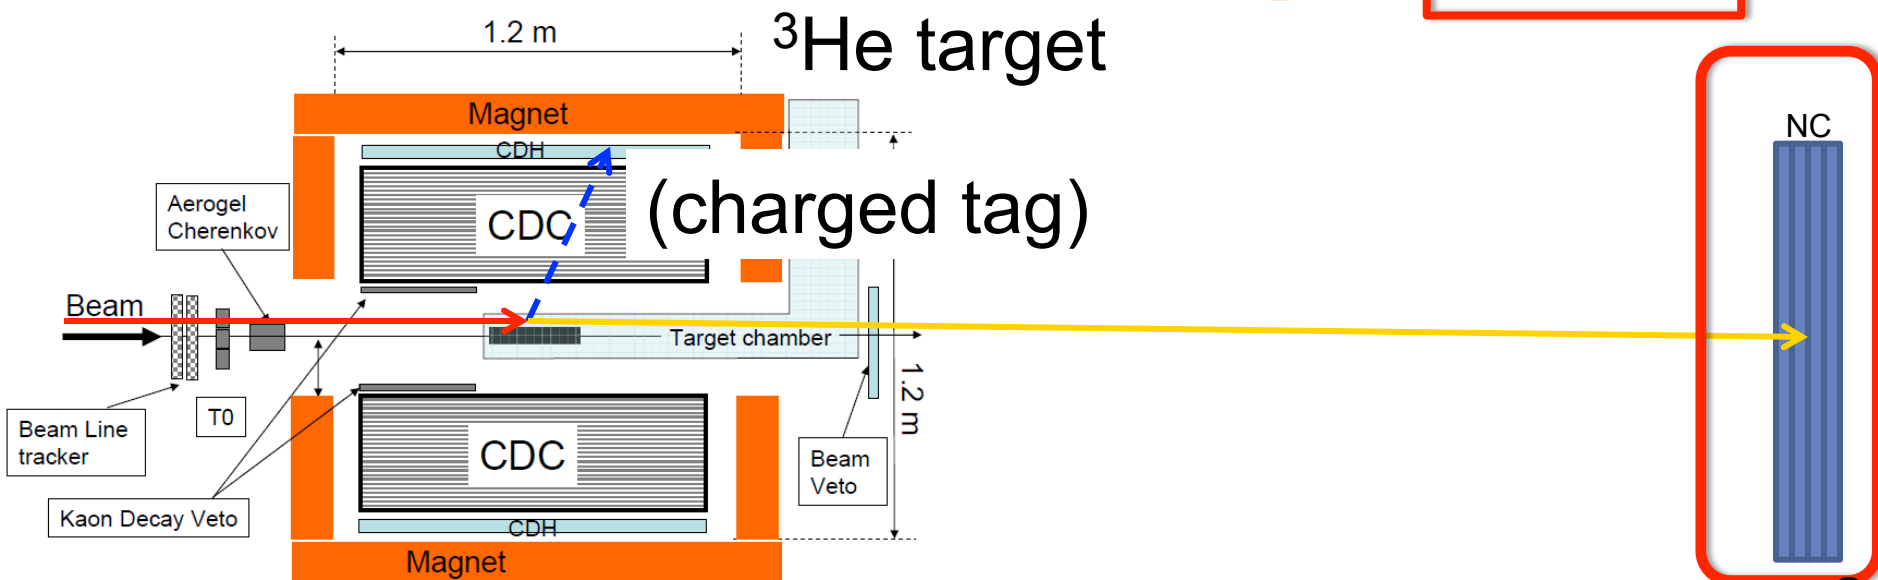

period	Primary beam intensity	duration	Kaon on target
March, 2013	14.5kW(18Tppp, 6s cycle)	30 hours	$1.1 \times 10^9$
May, 2013	24kw (30Tppp, 6s cycle)	88 hours	$5.1 \times 10^9$

## Analysis Result

1. Semi-inclusive  ${}^3\text{He}(K^-, n)$  spectrum
2. Exclusive spectrum
3.  ${}^3\text{He}(K^-, d)$  analysis

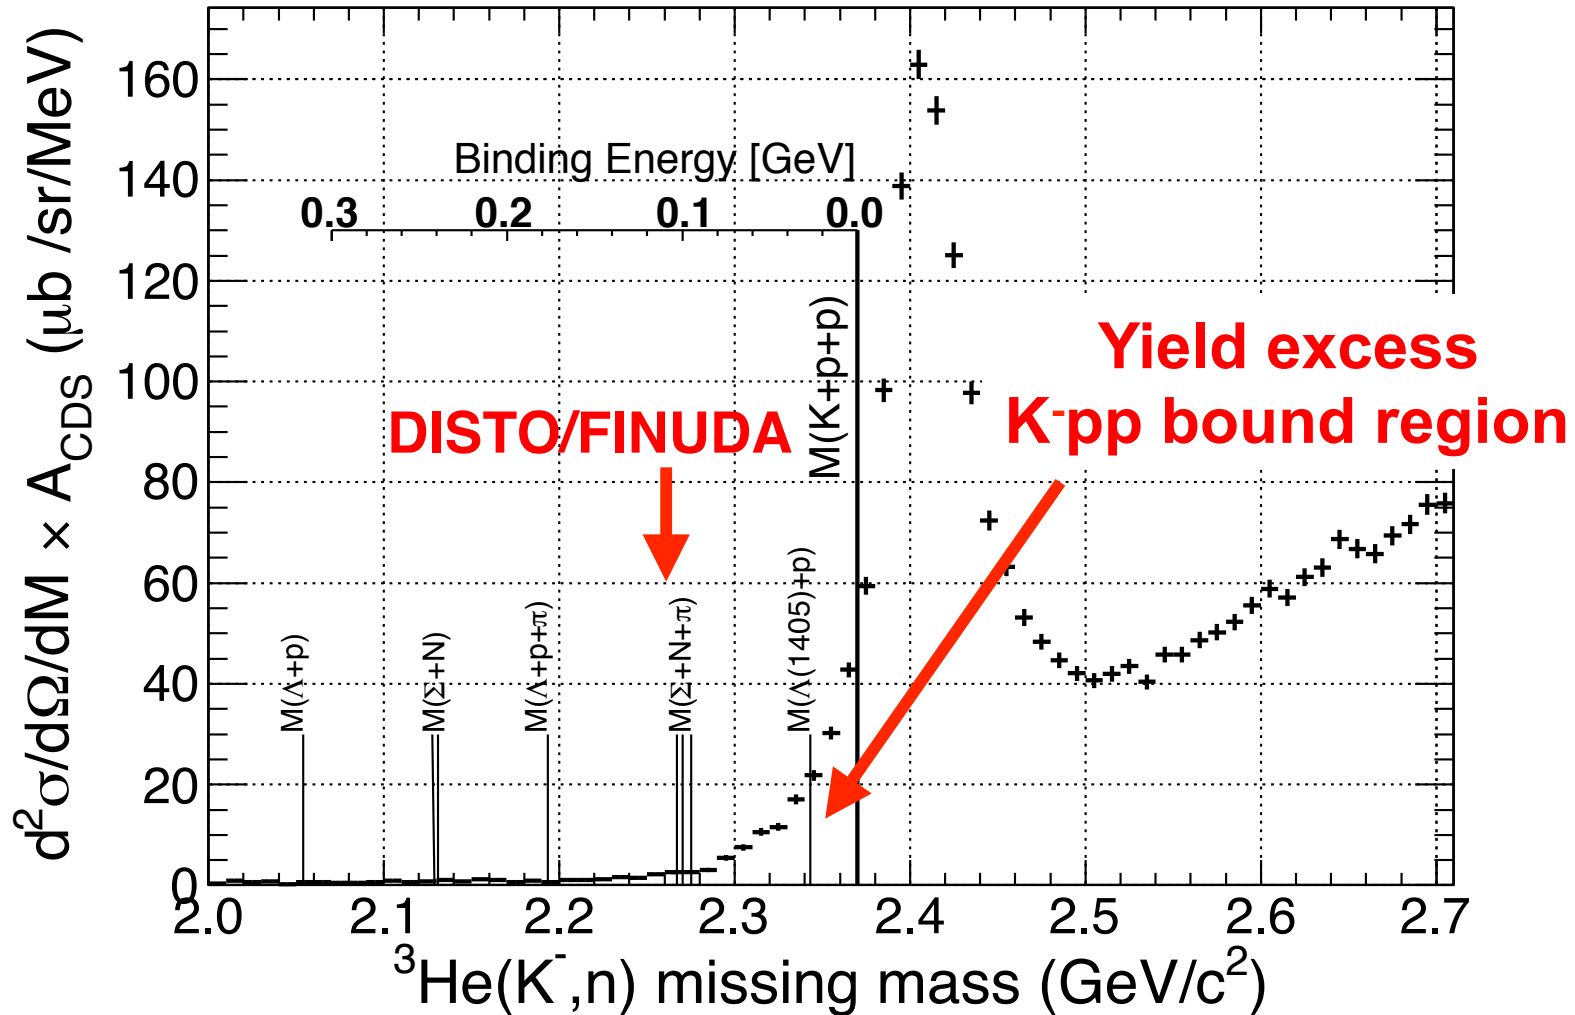

# Semi-inclusive ${}^3\text{He}(K^-, n)$ spectrum

- ${}^3\text{He}(K^-, n)$  missing mass spectrum
- Compression with quasi-free  $K^0$  Spectrum
- Contaminate target cell
- Contribution of  $\Sigma$  decay

# Semi-inclusive ${}^3\text{He}(\text{K}^-,n)$ spectrum

*biased by the request of charged track(s) in the CDS*

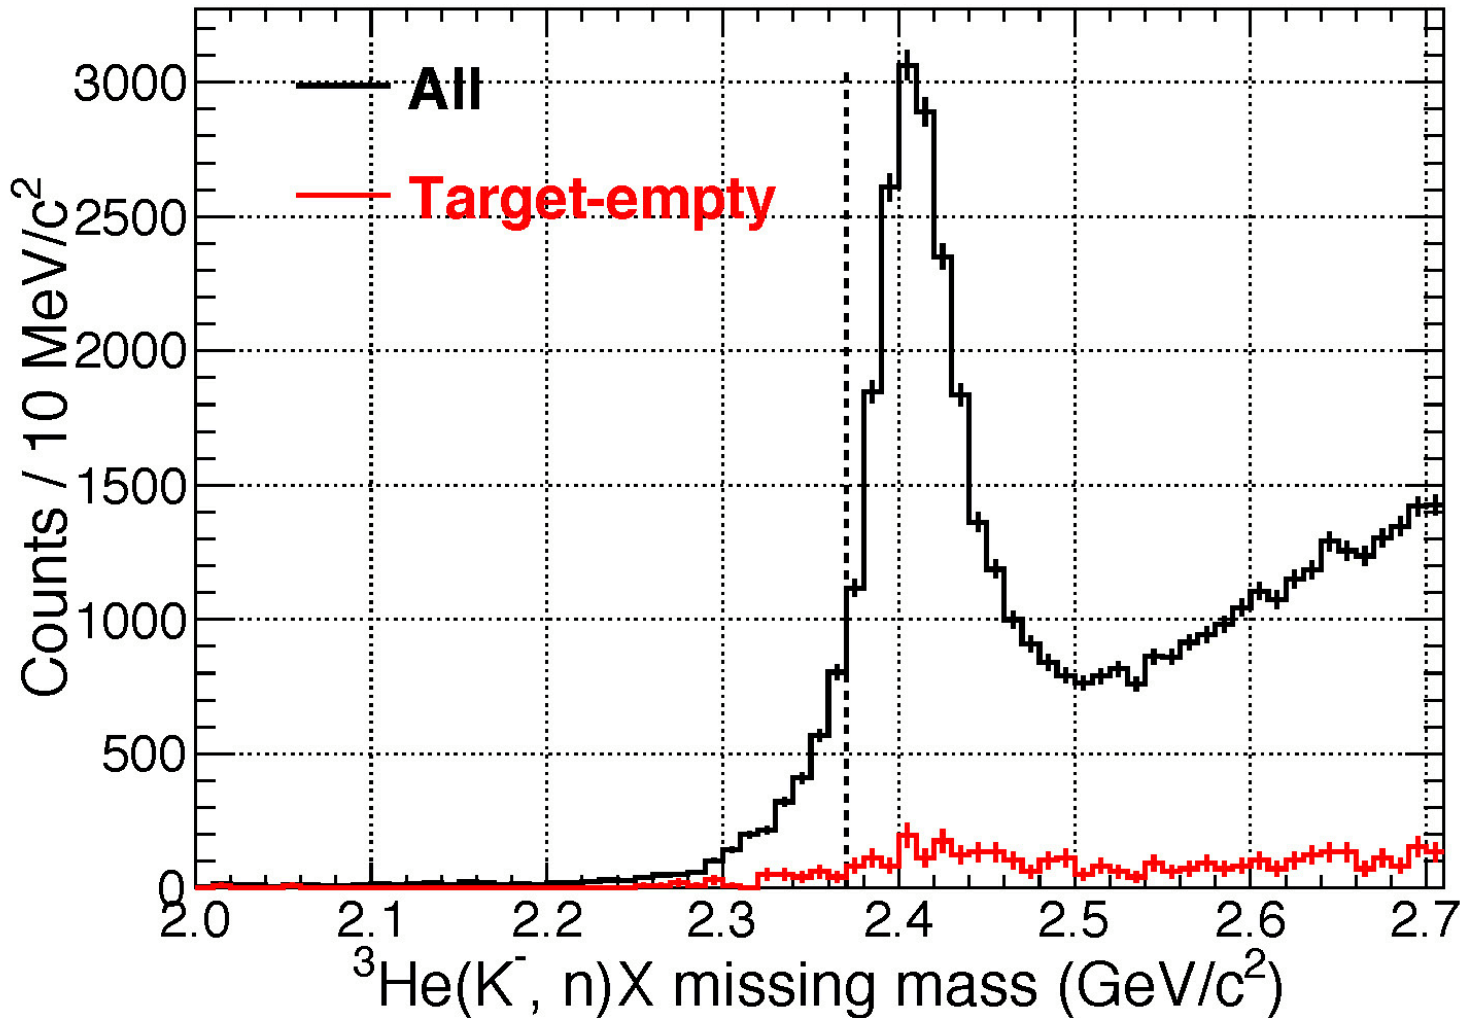

# Compression with quasi-free $K^0$ Spectrum

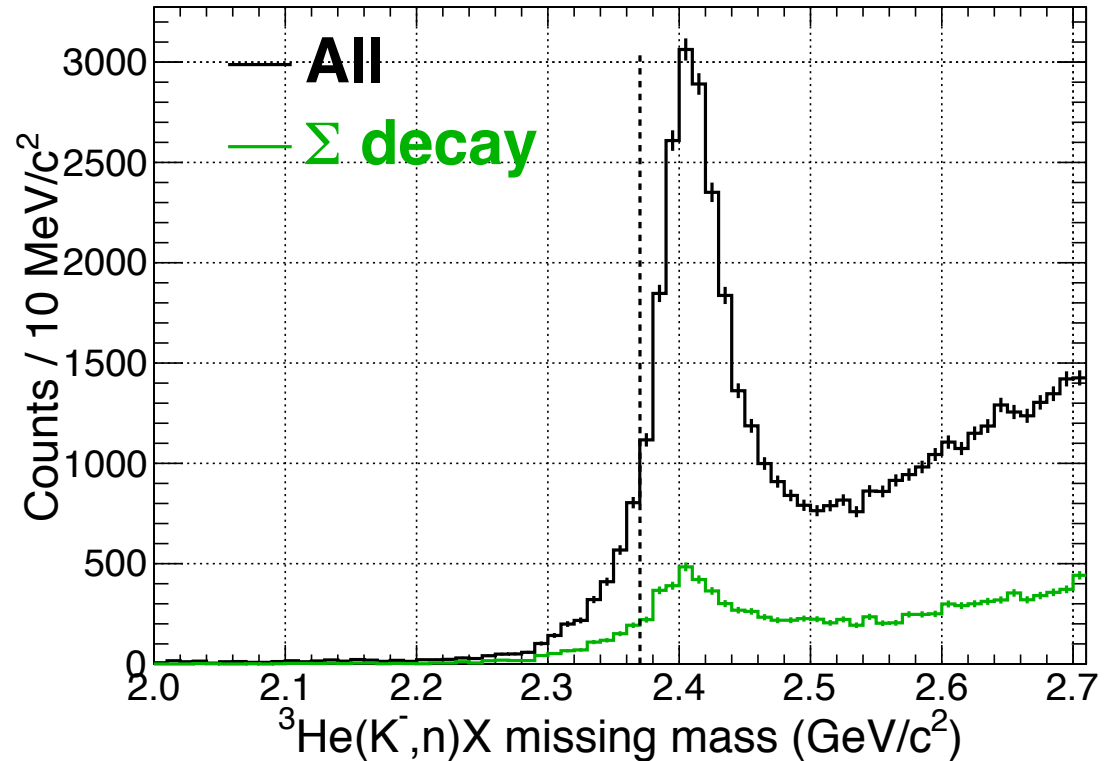

**Tail component in bound region  
is not due to detector resolution**

# Contamination from other than $^3\text{He}$ target

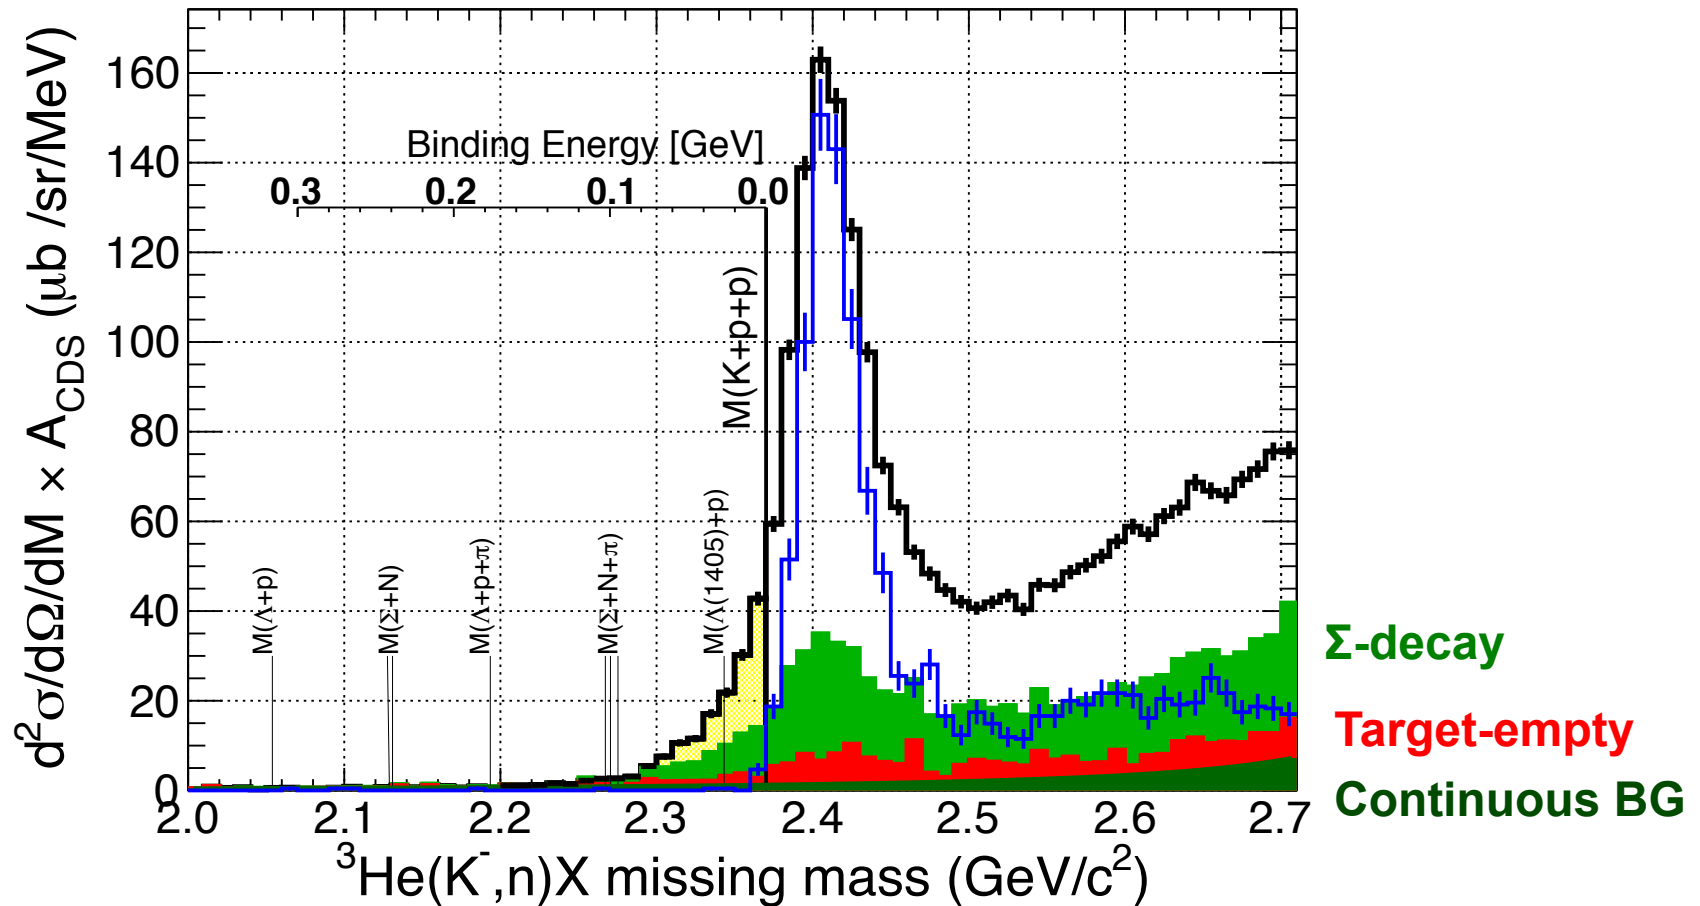

**Contamination contribution is too small**

# Single-nucleon processes

- ▶ Only  $KN \rightarrow \Sigma\pi$ ,  $\Sigma \rightarrow n\pi$  can contribute to the bound region
  - ~90% can be removed event by event
  - $KN \rightarrow \Lambda\pi$ ,  $\Lambda \rightarrow n\pi$  is not triggered

# Unknown excess

**There remains a statistically significant excess.**

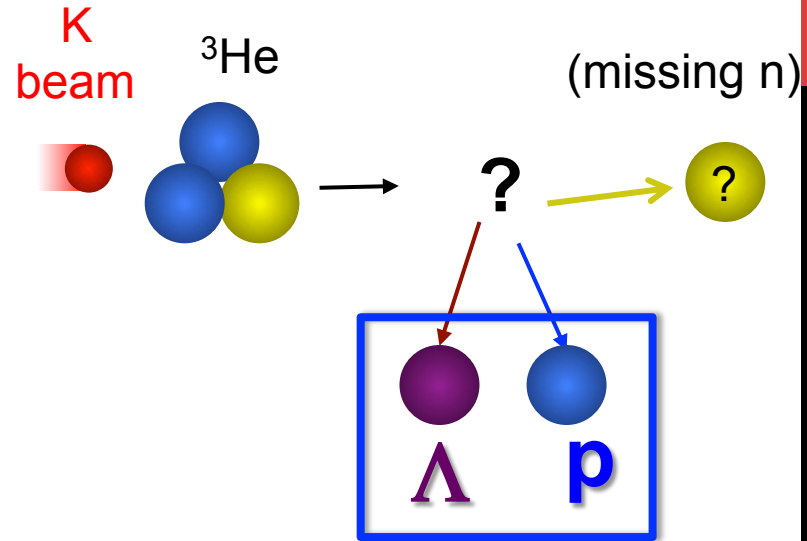

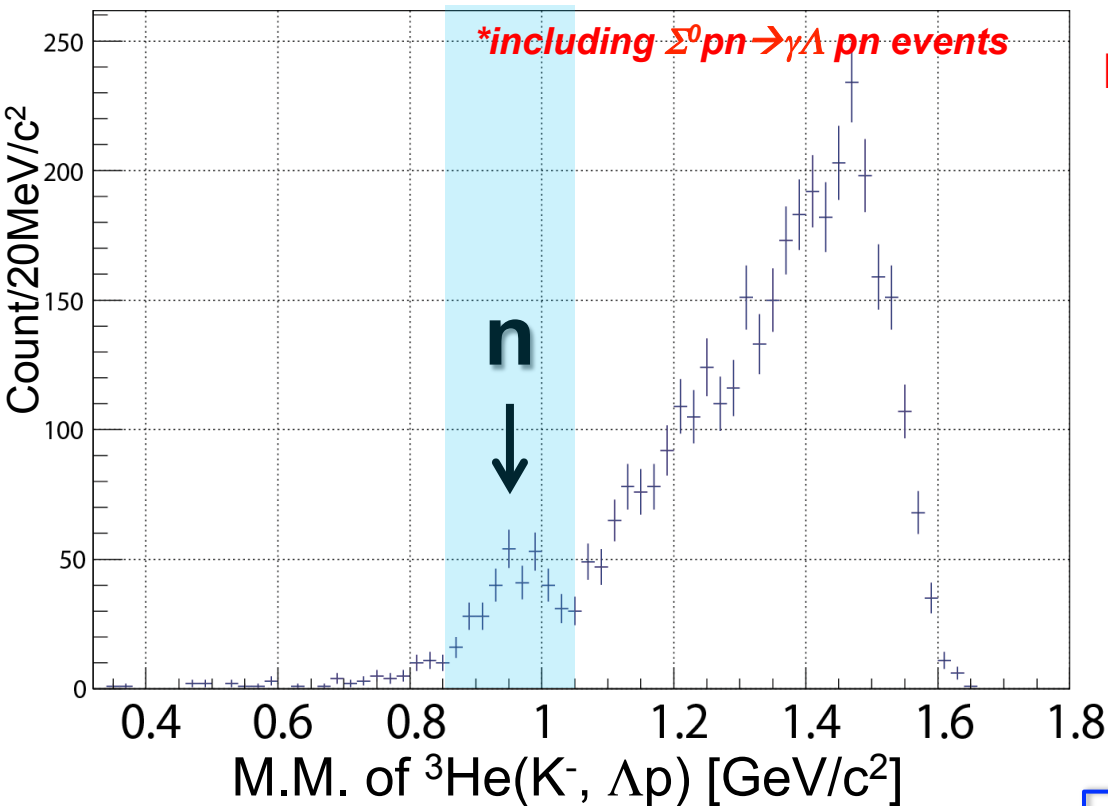

# Exclusive Spectrum

- $^3\text{He}(K^-, \Lambda p)$  missing mass
- $\Lambda p$  "n" energy correlation diagram

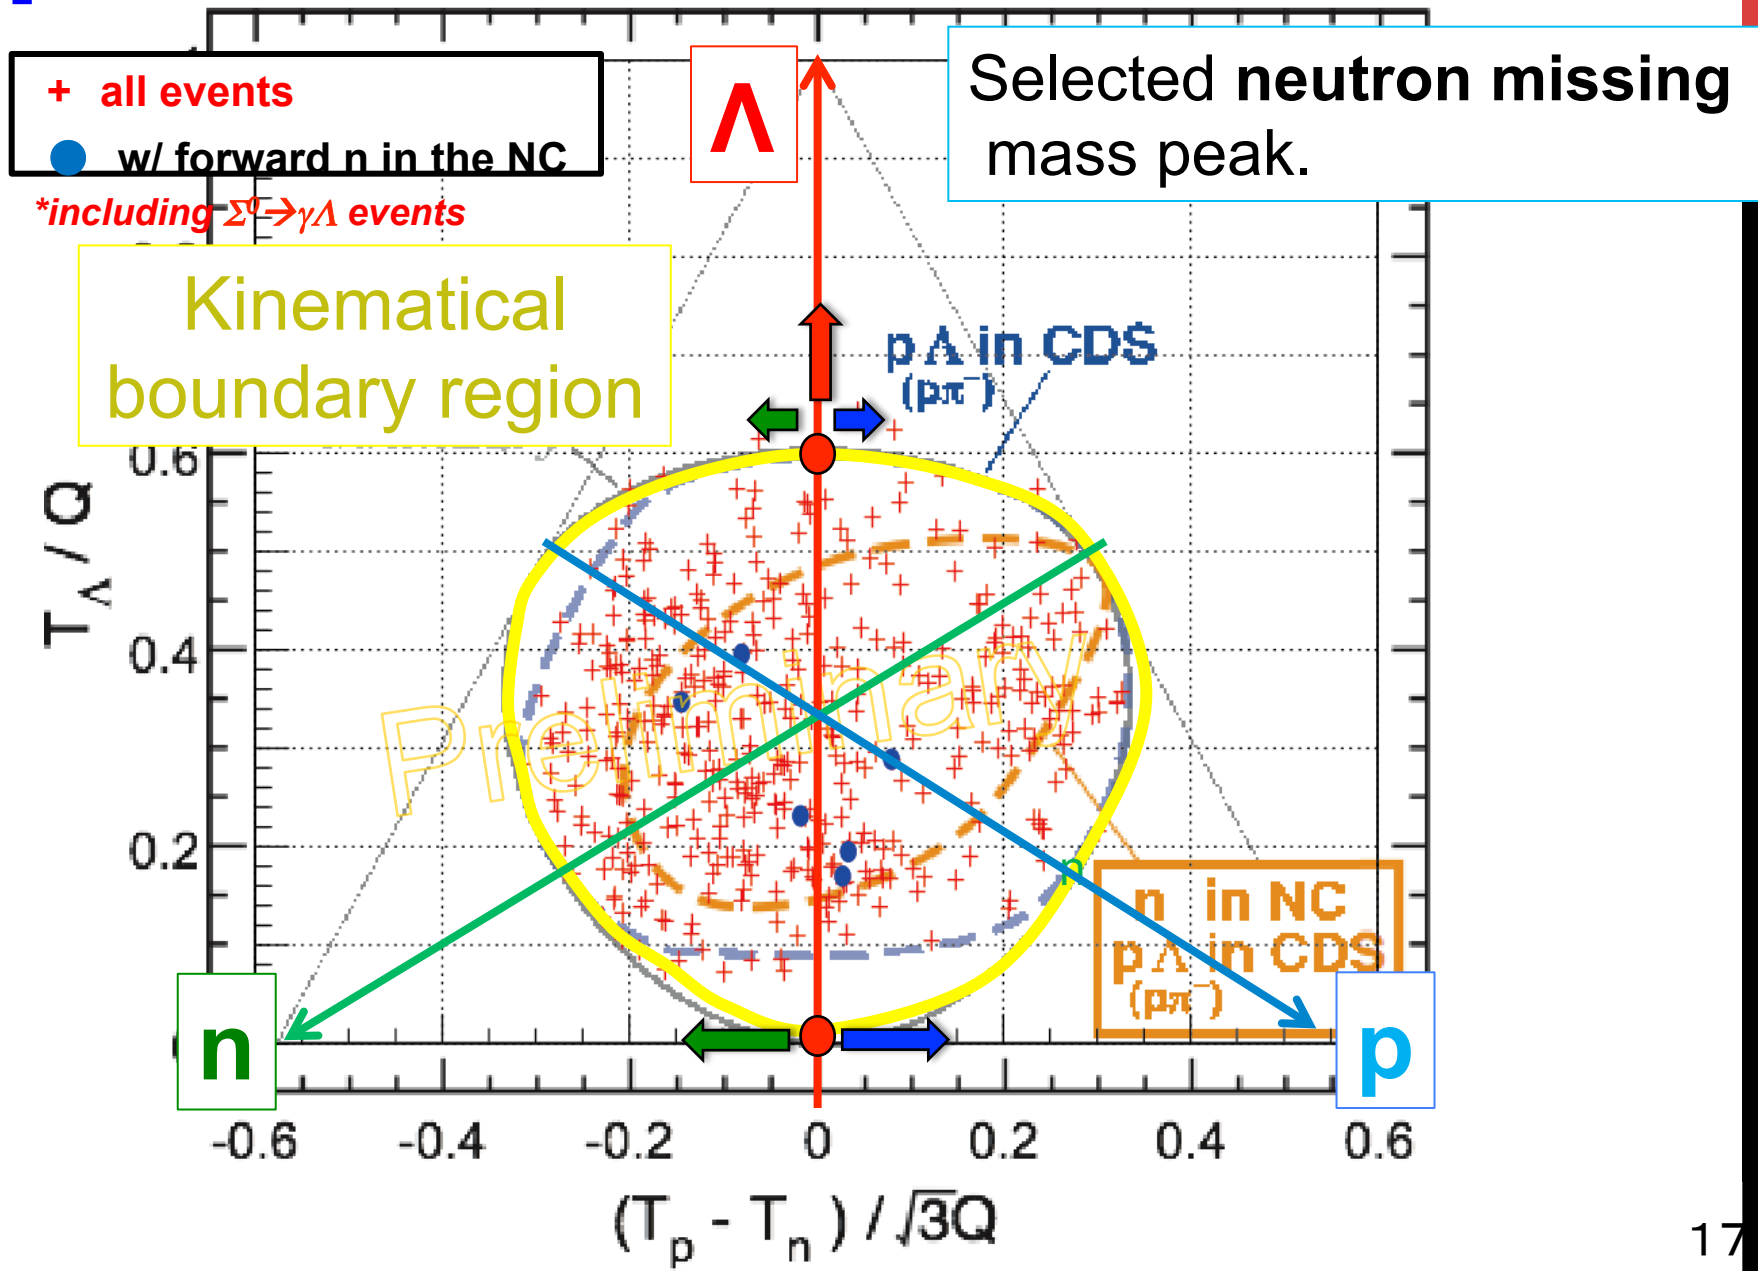

# $^3\text{He}(K^-, \Lambda p)$ Missing Mass

- **Missing neutron peak** is clearly seen.
- This include  $\Sigma^0(\gamma\Lambda)pn$ .

To study origin of  $\Lambda pn$  events.  
Next, check energy correlation.

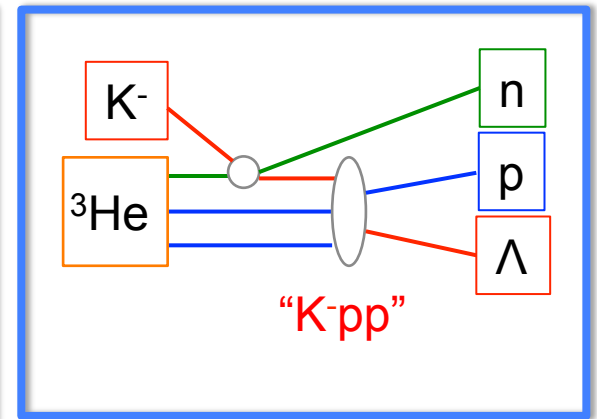

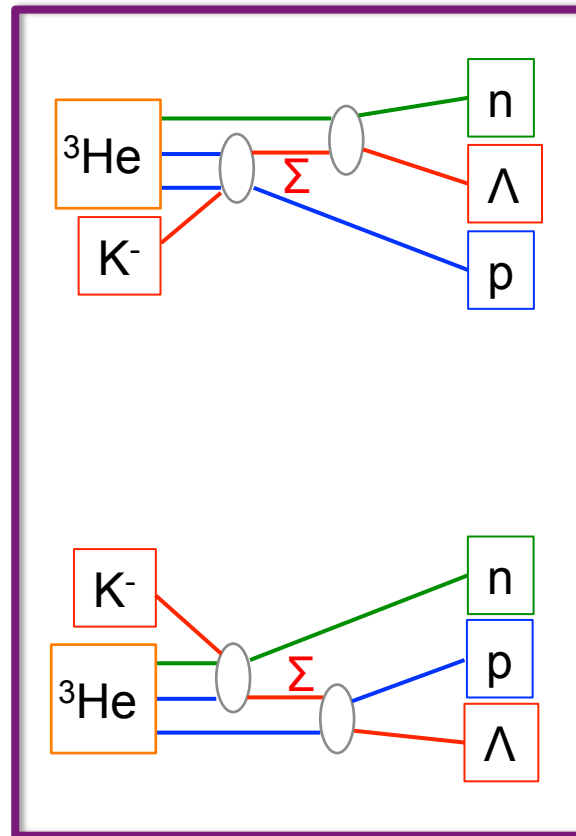

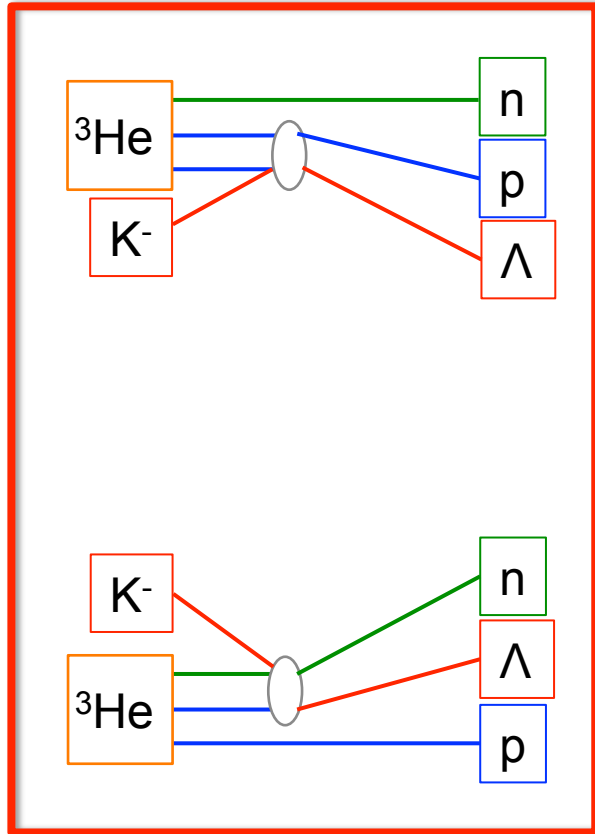

# $\Lambda$ p missing “n” correlation

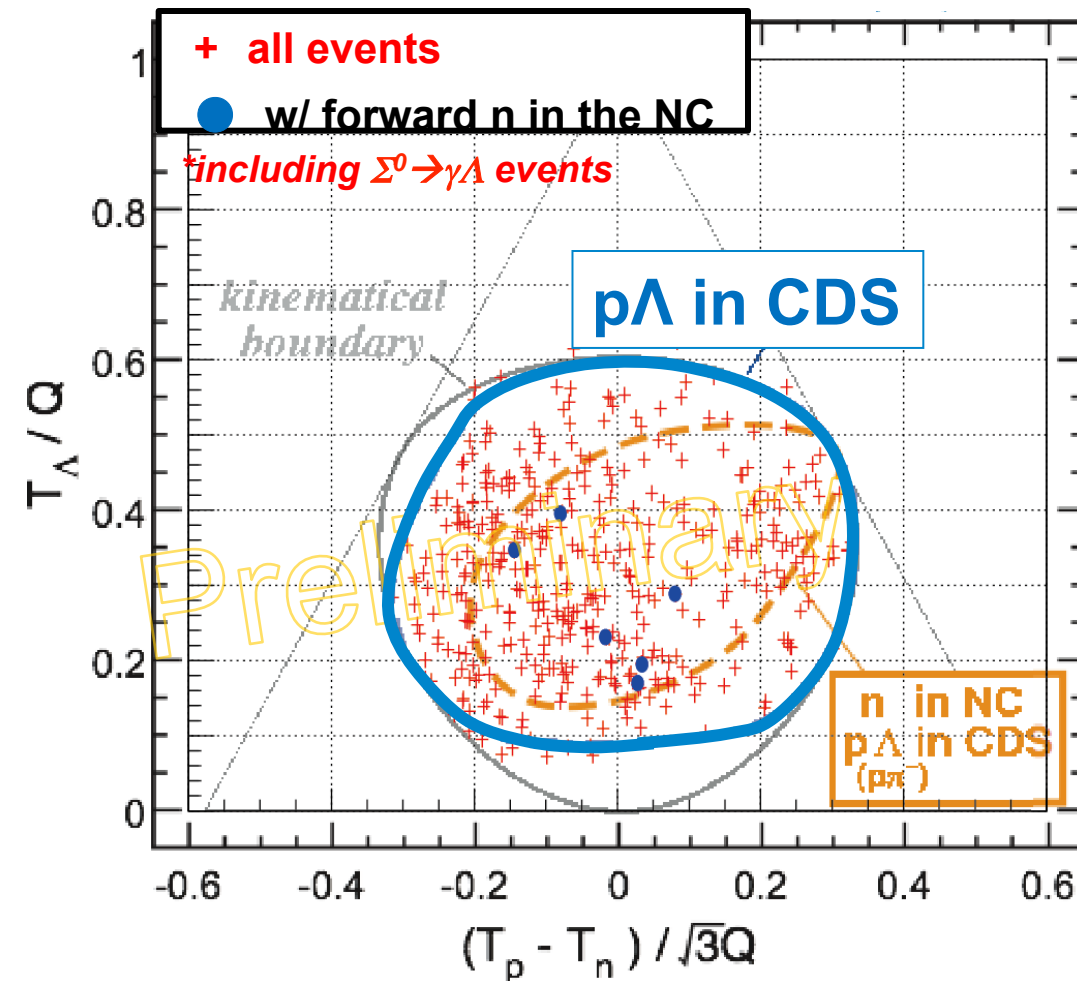

# $\Sigma$ - $\Lambda$ conversion (2 step)

2N-abs

K-pp

# $\Lambda$ p missing “n” correlation

Selected neutron missing mass peak.

- Events are scattered widely in phase space.
- Multi-N absorption processes exist.
- ☑ It seems 3N-abs( $\Lambda pn$ ) exists

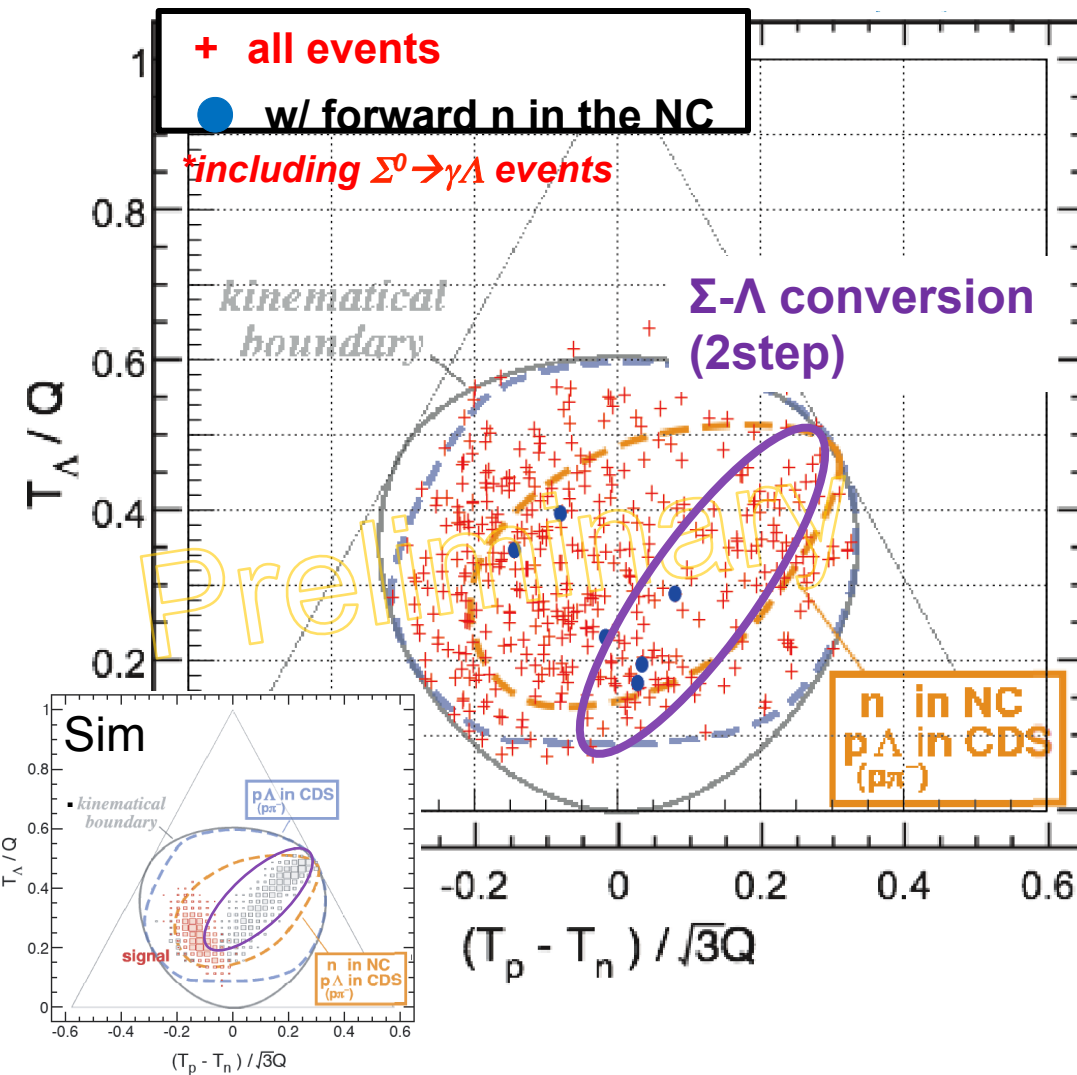

# $\Lambda$ p missing “n” correlation

Selected neutron missing mass peak.

- Events are scattered widely in phase space.
- Multi-N absorption processes exist.
  - It seems 3N-abs( $\Lambda p n$ ) exists
  - 2N-abs is very weak.
- “ $\Lambda p n$ ” w/ forward n in the NC are a few events.
  - We would like to carry out high statistical experiments !

# $\Lambda$ p missing “n” correlation

Selected neutron missing mass peak.

- Events are scattered widely in phase space.
- Multi-N absorption processes exist.
  - ☑ It seems 3N-abs( $\Lambda$ p $n$ ) exists
  - ☑ 2N-abs is almost nothing.
  - ☑ **can not see  $\Sigma$ - $\Lambda$  conversion line?**
- “ $\Lambda$ p $n$ ” w/ forward n in the NC is a few events.
  - ☑ We would like to carry out high statistical experiments !

# $\Lambda$ p missing “n” correlation

Selected neutron missing mass peak.

- Events are scattered widely in phase space.
- Multi-N absorption processes exist.
- ☑ It seems 3N-abs( $\Lambda$ p n) exists
- ☑ 2N-abs is almost nothing.
- ☑ can not see  $\Sigma$ - $\Lambda$  conversion line?
- “ $\Lambda$ p n” w/ forward n in the NC is a few events.
- ☑ We would like to carry out high statistical experiments !

# $^3\text{He}(\text{K}^-, \text{d})$ Spectrum

- $^3\text{He}(\text{K}^-, \text{d})$  missing mass spectrum
- $^3\text{He}(\text{K}^-, \text{d K}^-)$  missing mass spectrum
- $^3\text{He}(\text{K}^-, \text{d})$  missing mass tagged  $\text{K}^-$  “p”

K beam

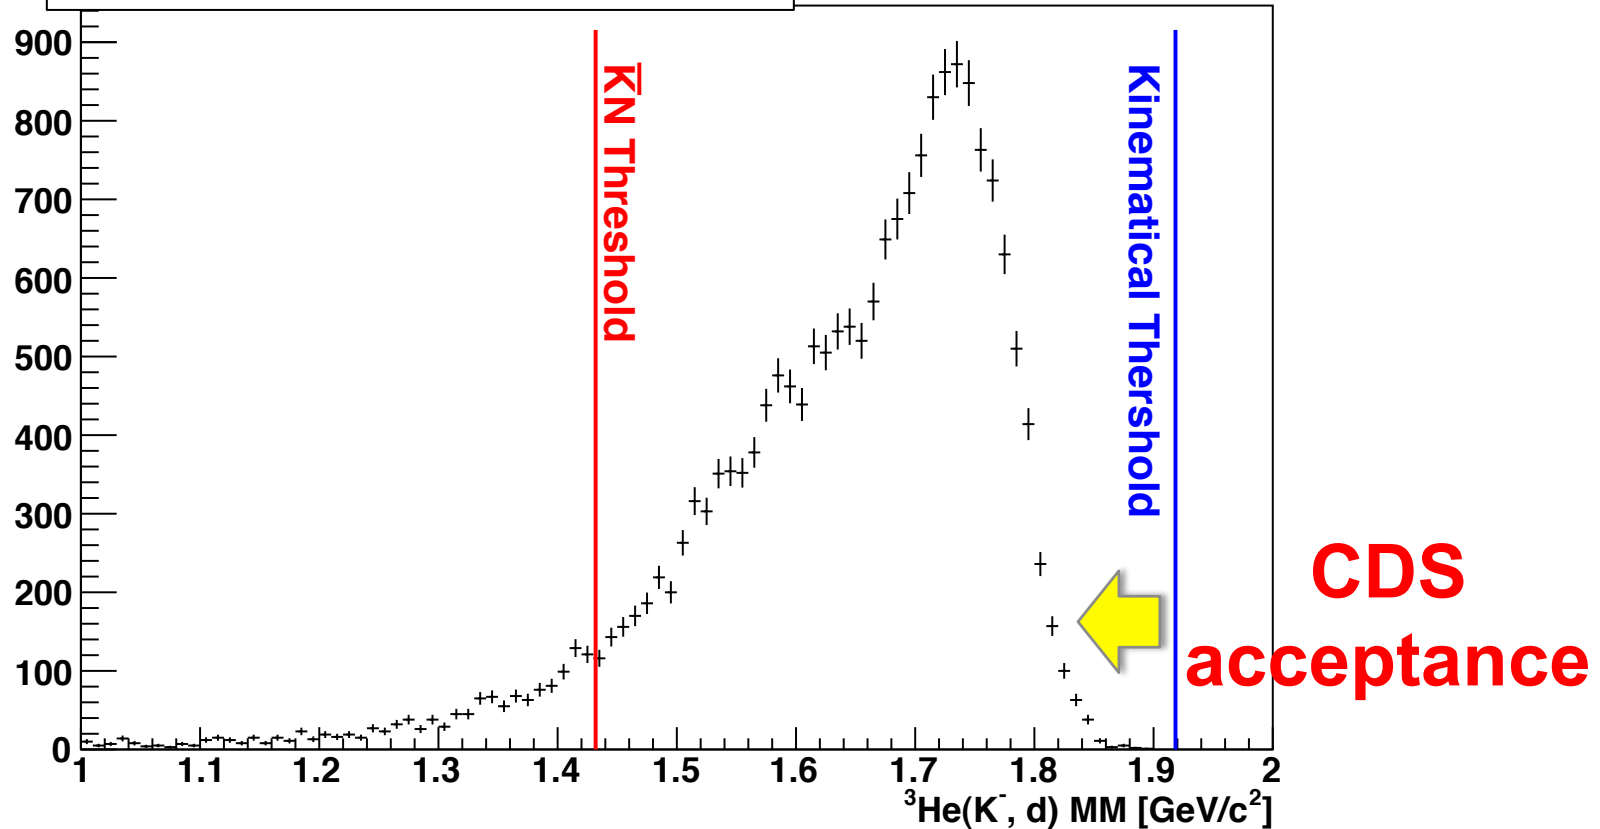

Elastic scatter?  
Hyperon?  
3N-absorption?

# $^3\text{He}(\text{K}^-, \text{d})$ missing mass spectrum

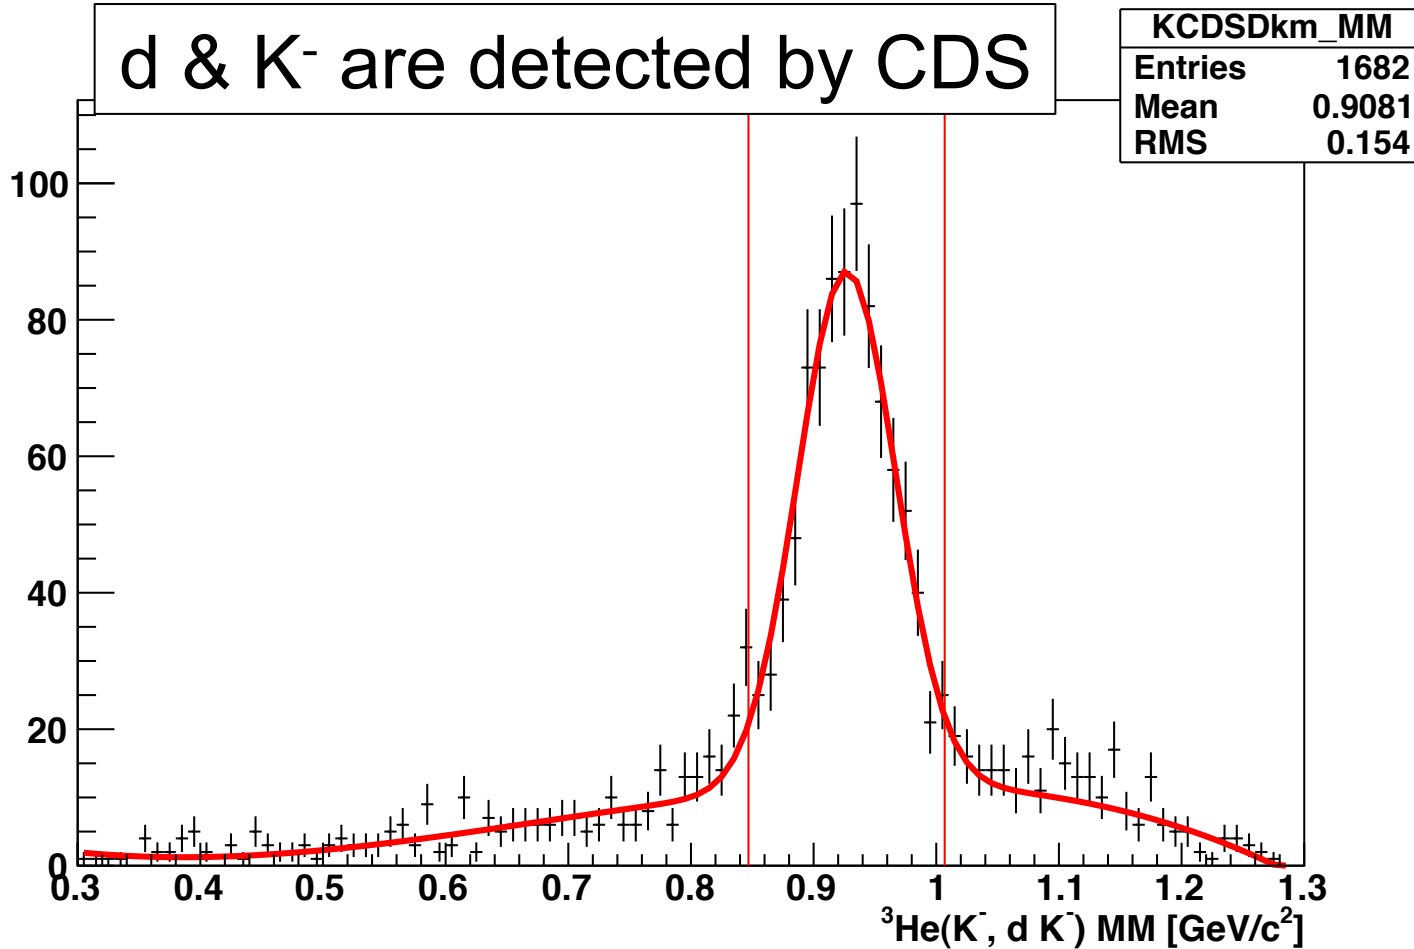

d is detected by CDS

$^3\text{He}(\text{K}^-, \text{d})$  spectrum is widely spread.

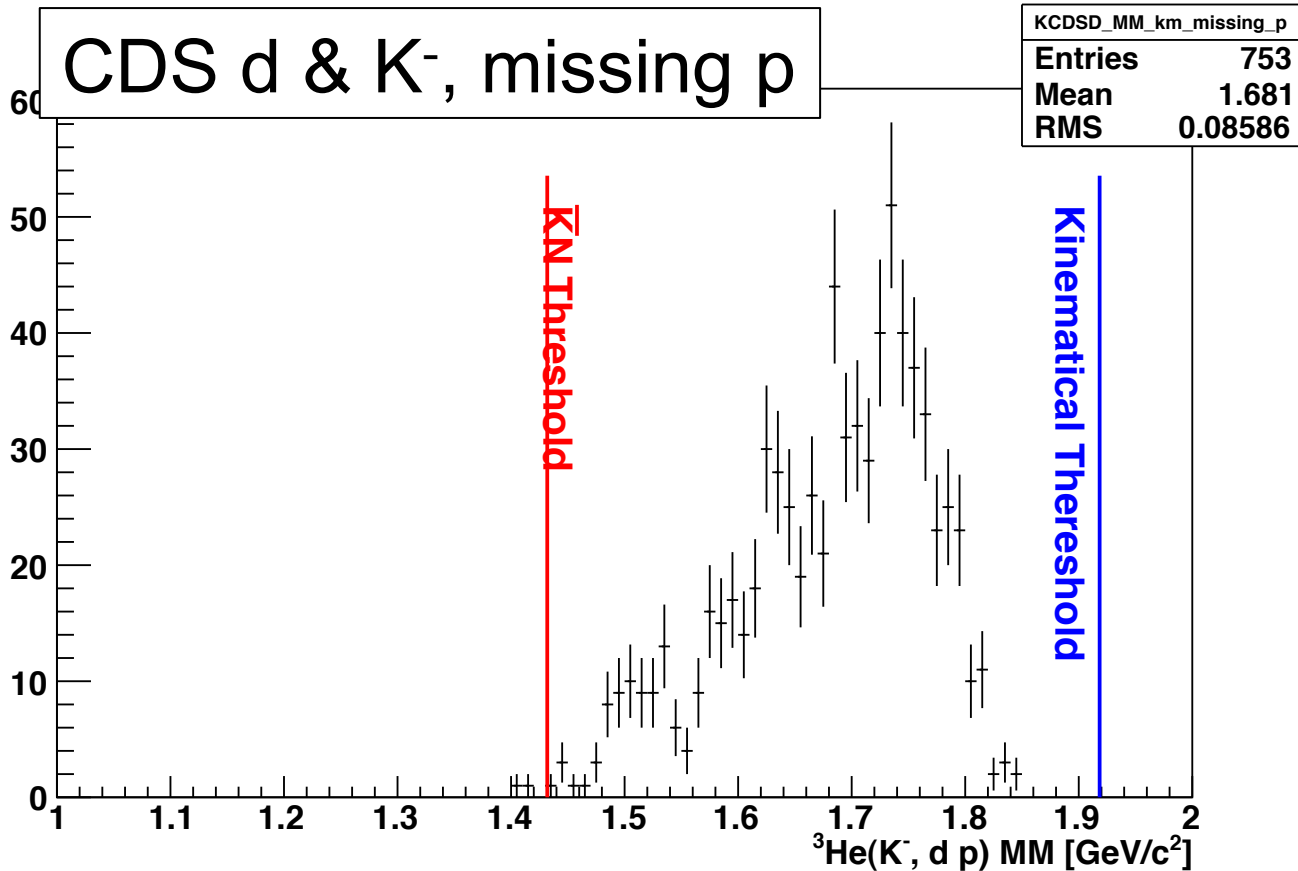

This spectrum is **hard** to explain by **elastic scatter**

# $^3\text{He}(K^-, d K^-)$ missing mass

$^3\text{He}(K^-, d K^-)$  MM is clearly seen **missing proton**.  
 $K^- + ^3\text{He} \rightarrow d + K^- + \text{''p''}$  has **low BG**

# $^3\text{He}(\text{K}^-, \text{d})$ missing mass w $\text{K}^-$ “p”

$^3\text{He}(\text{K}^-, \text{d})$  spectrum **don't change** by  $\text{K}^-$  “p” tag.

**$\text{K}^-$  is absorbed in  $^3\text{He}$ , decay into d  $\text{K}^-$  p.**

- directly? via  $Y^*$ ? Analysis is in progress.

This channel is very interesting.

# Summary

- **J-PARC E15 1<sup>st</sup> physics run was performed.**  
All detectors are working well and design values.  
Unfortunately, stopped at only 24kW\*4day running time (<1% of full proposal)
- **Semi-inclusive  ${}^3\text{He}(\text{K}^-, \text{n})$  spectrum** has an yield excess below the K-pp threshold.
- **$\Lambda$ p missing n** analysis indicate existence of 3-N absorption process
- **${}^3\text{He} + \text{K}^- \rightarrow \text{d} + \text{K}^- + \text{p}$**  channel is clearly seen.  
→ The spectrum suggests 3-N kaon absorption.

**Thanks your attention!**
