

The ERAWAST - initiative

How radioactive waste can be used for nuclear physics experiments

Dorothea Schumann, Rugard Dressler
Laboratory for Radiochemistry and Environmental Chemistry
Paul Scherrer Institute Villigen, Switzerland

- The ERAWAST project - history
- Sources for isotopes at PSI
- Prominent examples
 - ^{60}Fe from copper
 - source and radiochemical separation
 - applications
 - ^{44}Ti , ^{26}Al and ^{53}Mn from STIP samples
 - source and radiochemical separation
 - first experiment with a ^{44}Ti beam at ISOLDE
 - ^7Be from SINQ cooling water
 - source and radiochemical separation
- Proposal for the study of neutron capture cross sections of ^{53}Mn at n_TOF
- Potential proposal for the study of the $^7\text{Be}(n,\alpha)^4\text{He}$ and $^7\text{Be}(n,p)^7\text{Li}$ cross sections at n_TOF and SARAF

PSI accelerator facilities and the ERAWAST-project

Exotic Radionuclides from Accelerator Waste for Science and Technology

Objective:

Exploitation of accelerator waste for isolating rare exotic radionuclides

PSI 2006

PSI Villigen - Switzerland
August 29th to September 2nd

PSI 2011

PSI cyclotron

590 MeV protons
2.4 mA beam current
High activation of
shields, targets,
structure material

History:

- Radiochemical analytics of activated components for disposal
- Results showed high content of several rare isotopes
- Looking for potential users of these isotopes:
 - I. ERAWAST workshop 2006 (PSI), funded by ESF
 - II. ERAWAST workshop 2011 at PSI: first results and future program
- ~ 20 Partners (nuclear physics, astrophysics, AMS)

„Useful“ components of the PSI accelerator facilities

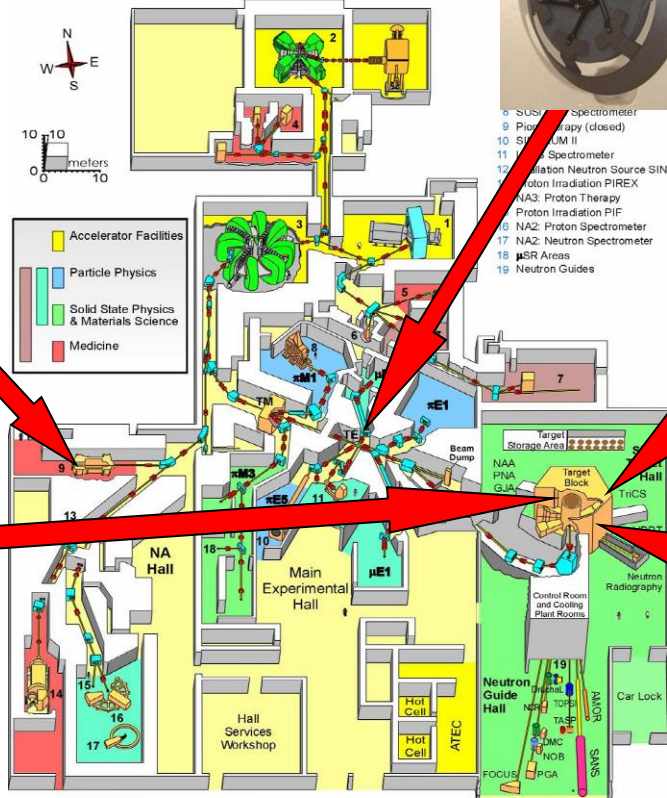

Copper beam dump

- ^{44}Ti , ^{53}Mn , ^{26}Al , ^{60}Fe , ^{59}Ni , ^{32}Si
- ^{60}Co – 5 GBq

SINQ cooling water

- ^7Be , ^{54}Mn , ^{22}Na , ^{88}Y

Myon production station

- Operation 1-3 years
- Beam doses 4 – 11 Ah
- Source for ^{10}Be

SINQ Target Irradiation Program-STIP

- ^{44}Ti , ^{53}Mn , ^{26}Al

SINQ target

- ^{207}Bi , ^{172}Hf ,
- ^{173}Lu , ^{194}Hg ,
- ^{202}Pb , ^{125}Sb ,
- ^{106}Ru , ^{44}Ti

Special irradiation positions with 590 MeV protons

V for ^{44}Ti production

Bi for ^{205}Pb production

Accelerator waste

Shielding, construction material, targets, beam dumps, cooling
intensely exposed by high-energetic protons and secondary particles
dismounted, cooled
ready or foreseen for disposal

Waste components:

Copper beam dump irradiated at the 590-MeV proton beam station at PSI, dismantled about 15 years ago

^{26}Al , ^{59}Ni , ^{53}Mn , ^{60}Fe , ^{44}Ti

Proton-irradiated carbon from target E

^{10}Be , ^7Be , ^{14}C , ^3H

Material from the SINQ facility

Lead targets

^{207}Bi , ^{182}Hf , rare earth elements (e.g. ^{146}Sm , several Dy isotopes) and lighter isotopes

STIP program (material research program)

Stainless steel for ^{44}Ti , ^{26}Al , ^{53}Mn production

SINQ cooling water

^7Be , long-lived isotopes from irradiated structure material (^{22}Na , ^{88}Y and many others)

Special irradiations

The SINQ facility offers the possibility to irradiate materials with 590 MeV protons at special positions.

Tended experiments for isotope production can be offered

V for ^{44}Ti production

Bi for ^{205}Pb production

Irradiation with 71 MeV protons (injector 2) and up to 590 MeV neutrons (NAA, PNA)

Chemical separations with other material

^{60}Fe

Astrophysical background

Radiochemical separation

Determination of the half life

Determination of the neutron capture cross section
at stellar energies

- represents an important chronometer for periods of several Million years ($t_{1/2} \sim 1.5 \cdot 10^6 \text{ yr}$)
 - ➔ formation of the solar system,
nearby supernovae / AGBs
 γ -ray astronomy
- is produced in massive stars prior to the final supernova explosion (alternatively by AGB stars?)
- is in any case made by the **s process** via neutron capture reactions

Scientific aspects:

- Measured and calculated ratios of $^{60}\text{Fe}/^{26}\text{Al}$ are not in agreement
- Only one half-life measurement (Kutschera 1986; uncertainty 20%)
- Neutron capture cross sections unknown
- Nearly no alternative production route

Necessary for evaluation

Cross sections for production

$^{58}\text{Fe}(n,\gamma)^{59}\text{Fe}$

$^{59}\text{Fe}(n,\gamma)^{60}\text{Fe}$

$^{60}\text{Fe}(n,\gamma)^{61}\text{Fe}$

Half-lives for decay

^{59}Fe ^{60}Co

^{61}Co ^{61}Fe

^{60}Fe

**^{60}Fe sample material
urgently needed!**

s-process: neutron capture and following β^- -decay

Separation and preparation of ^{60}Fe

Source: copper beam dump

Dissolution of Cu chips (3 g) in 7 M HNO_3 (50MBq ^{60}Co)

Evaporation to dryness

Dissolution in 7 M HCl + 5 mg Co^{2+} as carrier

Extraction with methylisobutylketone

Aqueous phase:

Ni, Co, Cu,

organic phase: Fe

Back extraction with 0.1 M HCl , repetition of procedure

Result: $7.8 \cdot 10^{15}$ or 777 ng ^{60}Fe atoms,
decontamination factor (Co) $> 10^8$
(0.3 Bq)

Evaporation of the final solution onto a graphite backing for the target

Solution for half life measurement

Re-determination of the half-life of ^{60}Fe

$$T_{1/2}^{60\text{Fe}} = \frac{N_{60\text{Fe}}}{A_{60\text{Fe}}} \ln 2$$

A: ingrowth of ^{60}Co ; N: ICP-MS

^{60}Fe : no γ radiation, low β -energy

→ very good chemical separation from Co necessary

- ICP-MS can measure isotope ratios for the iron isotopes
- ICP-MS in principle possible, but interference with ^{60}Ni
- Correction with other Ni-isotopes not possible, because no natural isotope ratios (production of stable isotopes via spallation in the beam dump)

→ addition of stable Fe carrier necessary

→ addition of stable Ni carrier necessary

$$T_{1/2} = 2.62 \pm 0.04 \cdot 10^6 \text{ years (1s)}$$

$A_{(t=0)}^{60}\text{Co} = 0.207 \pm 0.006 \text{ Bq}$ (starting with $\sim 50 \text{ MBq}$ in the Cu-chips)

$A^{60}\text{Fe} = 49.19 \pm 0.11 \text{ Bq}$

$m(\text{Fe}_{\text{stable}}) = 2.6662 \pm 0.0009 \text{ mg}$

($M=55.9020 \pm 0.0033 \text{ g/mol}$ because of non-natural abundance)

$I(N_{60\text{Fe}}/N_{\text{Fe}}) = 2.0483 \pm 0.0035 \cdot 10^{-4}$

- Measurement of the increase of the Co-daughter (determination of the number of ^{60}Fe atoms)

^{60}Fe : no γ radiation, low β -energy

- Measurement of the ^{61}Fe production (1027/1205 keV) \rightarrow KIT Karlsruhe

Results

- total number of ^{60}Fe atoms = $7.8 \cdot 10^{15}$ or 777ng (1.37 μg)
- total number of capture events = 118 (single) and 17 (coinc)
- time-integrated neutron flux = $1.7 \cdot 10^{14}$

$t_{1/2} = 6 \text{ min}$
 $E_g = 298, 1027, 1205 \text{ keV}$
 $I_g = 22, 43, 44(5)\%$

Radiochemical separation

1. Elution from the LEWATIT ion exchanger with 2M HCl
2. Purification of the ^7Be fraction (^{22}Na , ^{88}Y , ^{54}Mn , ^{10}B , ^7Li)

Procedure:

- Evaporation of the HCl solution
- Dissolution in 0.1M HNO_3
- Loading onto the column, washing with 0.1M HNO_3 – elution of ^{10}B (BO_3^-)
- Elution of ^{22}Na and ^7Li with 0.1M HNO_3
- Elution of ^7Be
- Elution of ^{88}Y , ^{54}Mn and others

Separation Scheme for the ^7Be separation

~ 200 GBq ^7Be can be processed in one batch
Contains comparable amounts of $^9/^{10}\text{Be}$

Proposal for the ISOLDE and Neutron Time-of-Flight Committee

Measurement of $^7\text{Be}(n,\alpha)^4\text{He}$ and $^7\text{Be}(n,p)^7\text{Li}$ cross sections

Figure: Comparison of the evaluated cross section of the $^7\text{Be}(n,\alpha)^4\text{He}$ reaction in various libraries, from thermal neutron energy to 1 MeV

$^7\text{Be}(n,\alpha)^4\text{He}$:

Very low cross sections, high amounts of ^7Be necessary ($\sim 1\text{-}10\ \mu\text{g}$, $10^{17}\text{-}10^{18}$ atoms, 10-100 GBq)

Impurities of $^9/^{10}\text{Be}$ have only slight influence

Background suppression possible

$^7\text{Be}(n,p)^7\text{Li}$:

Higher cross sections, less amounts needed ($\sim 0.1\ \mu\text{g}$ - 10^{16} atoms, 1 GBq)

Impurities of $^9/^{10}\text{Be}$ have more influence

Background suppression more difficult due to lower energy of the proton

Mass separation necessary!

Second joint experiment ISOLDE - n_TOF

$^7\text{Be}(p,\gamma)^8\text{B}$: importance for the physics of the Sun and the evaluation of the solar neutrino flux

First target:

Online production

1 GeV protons on graphite

extraction of $1.8 \cdot 10^{10}/\text{s}$ ^7Be

atoms at 60 keV

implanted in Cu ($5 \cdot 10^{15}$ ^7Be atoms)

Second target:

Irradiated graphite from target M (PSI)

$1.17 \cdot 10^{16}$ ^7Be atoms

Editor: J.P. Schiffer

ERAWAST provides rare exotic isotopes in sufficient amounts for several nuclear physics experiments

- ^{60}Fe half life and neutron capture cross section
- ^{44}Ti $^{44}\text{Ti}(\alpha, p)^{47}\text{V}$ reaction
- ^{10}Be from graphite targets; for p-induced reactions (Denmark), neutron capture (FRANZ)
- ^{63}Ni separation of the decay product ^{63}Cu ; target for n_TOF
- ^{207}Bi calibration source for PTB
- and many others

Two proposals for joint experiments: ISOLDE – n_TOF

- Neutron capture cross section of ^{53}Mn at n_TOF
- Measurement of $^7\text{Be}(n, \alpha)^4\text{He}$ and $^7\text{Be}(n, p)^7\text{Li}$ cross sections
