QUARKS ???

WHO BELIEVED IN QUARKS ?

Gell-Mann had introduced quarks as a mathematical concept from which relations among phenomena could be abstracted, and the underlying model then dropped. He liked to compare this to French cuisine where “a piece of pheasant meat is cooked between two pieces of veal, which are then discarded”.¹⁶ (Frank Close)

Reliable Perturbative Results for Strong Interactions?*

H. David Politzer

Jefferson Physical Laboratories, Harvard University, Cambridge, Massachusetts 02138

(Received 3 May 1973)

An explicit calculation shows perturbation theory to be arbitrarily good for the deep Euclidean Green's functions of any Yang-Mills theory and of many Yang-Mills theories with fermions. Under the hypothesis that spontaneous symmetry breakdown is of dynamical origin, these symmetric Green's functions are the asymptotic forms of the physically significant spontaneously broken solution, whose coupling could be strong.

Ultraviolet Behavior of Non-Abelian Gauge Theories*

David J. Gross† and Frank Wilczek

Joseph Henry Laboratories, Princeton University, Princeton, New Jersey 08540

(Received 27 April 1973)

It is shown that a wide class of non-Abelian gauge theories have, up to calculable logarithmic corrections, free-field-theory asymptotic behavior. It is suggested that Bjorken scaling may be obtained from strong-interaction dynamics based on non-Abelian gauge symmetry.

Heavy Quarks and e^+e^- Annihilation*

Thomas Appelquist† and H. David Politzer‡

Lyman Laboratory of Physics, Harvard University, Cambridge, Massachusetts 02138

(Received 19 November 1974)

The effects of new, heavy quarks are examined in a colored quark-gluon model. The e^+e^- total cross section scales for energies far above any quark mass. However, it is much greater than the scaling prediction in a domain about the nominal two-heavy-quark threshold, despite $\sigma_{e^+e^-}$ being a weak-coupling problem above 2 GeV. We expect spikes at the low end of this domain and a broad enhancement at the upper end.

Is Bound Charm Found?*

A. De Rújula

Lyman Laboratory of Physics, Harvard University, Cambridge, Massachusetts 02138

and

S. L. Glashow†

Center for Theoretical Physics, Massachusetts Institute of Technology, Cambridge, Massachusetts 02139

(Received 27 November 1974)

We argue that the newly discovered narrow resonance at 3.1 GeV is a 3S_1 bound state of charmed quarks and we show the consistency of this interpretation with known meson systematics. The crucial test of this notion is the existence of charmed hadrons near 2 GeV.

RELATIVISTIC
VERSION

De Grand, Jaffe,
Johnson, Kiskis, 1975

Once upon a time, there was a controversy in particle physics. There were some physicists¹ who denied the existence of structures more elementary than hadrons, and searched for a self-consistent interpretation wherein all hadron states, stable or resonant, were equally elementary. Others,² appalled by the teeming democracy of hadrons, insisted on the existence of a small number of fundamental constituents and a simple underlying force law. In terms of these more fundamental things, hadron spectroscopy should be qualitatively described and essentially understood just as are atomic and nuclear physics.

$$\Lambda [uds] \rightarrow \pi^{-} [d\bar{u}] p [uud]$$

total recoiling hadron mass ($\Lambda\pi^+\pi^+\pi^+\pi^-$) 2426 ± 12 MeV.¹²

This mass is in reasonable agreement with the values predicted by De Rujula, Georgi, and Glashow¹³ for the lowest-lying charmed-baryon states of charge +2, 2420 MeV ($J^P = \frac{3}{2}^+$, $I=1$, Σ_C^*)

Nick Samios et al., 1975

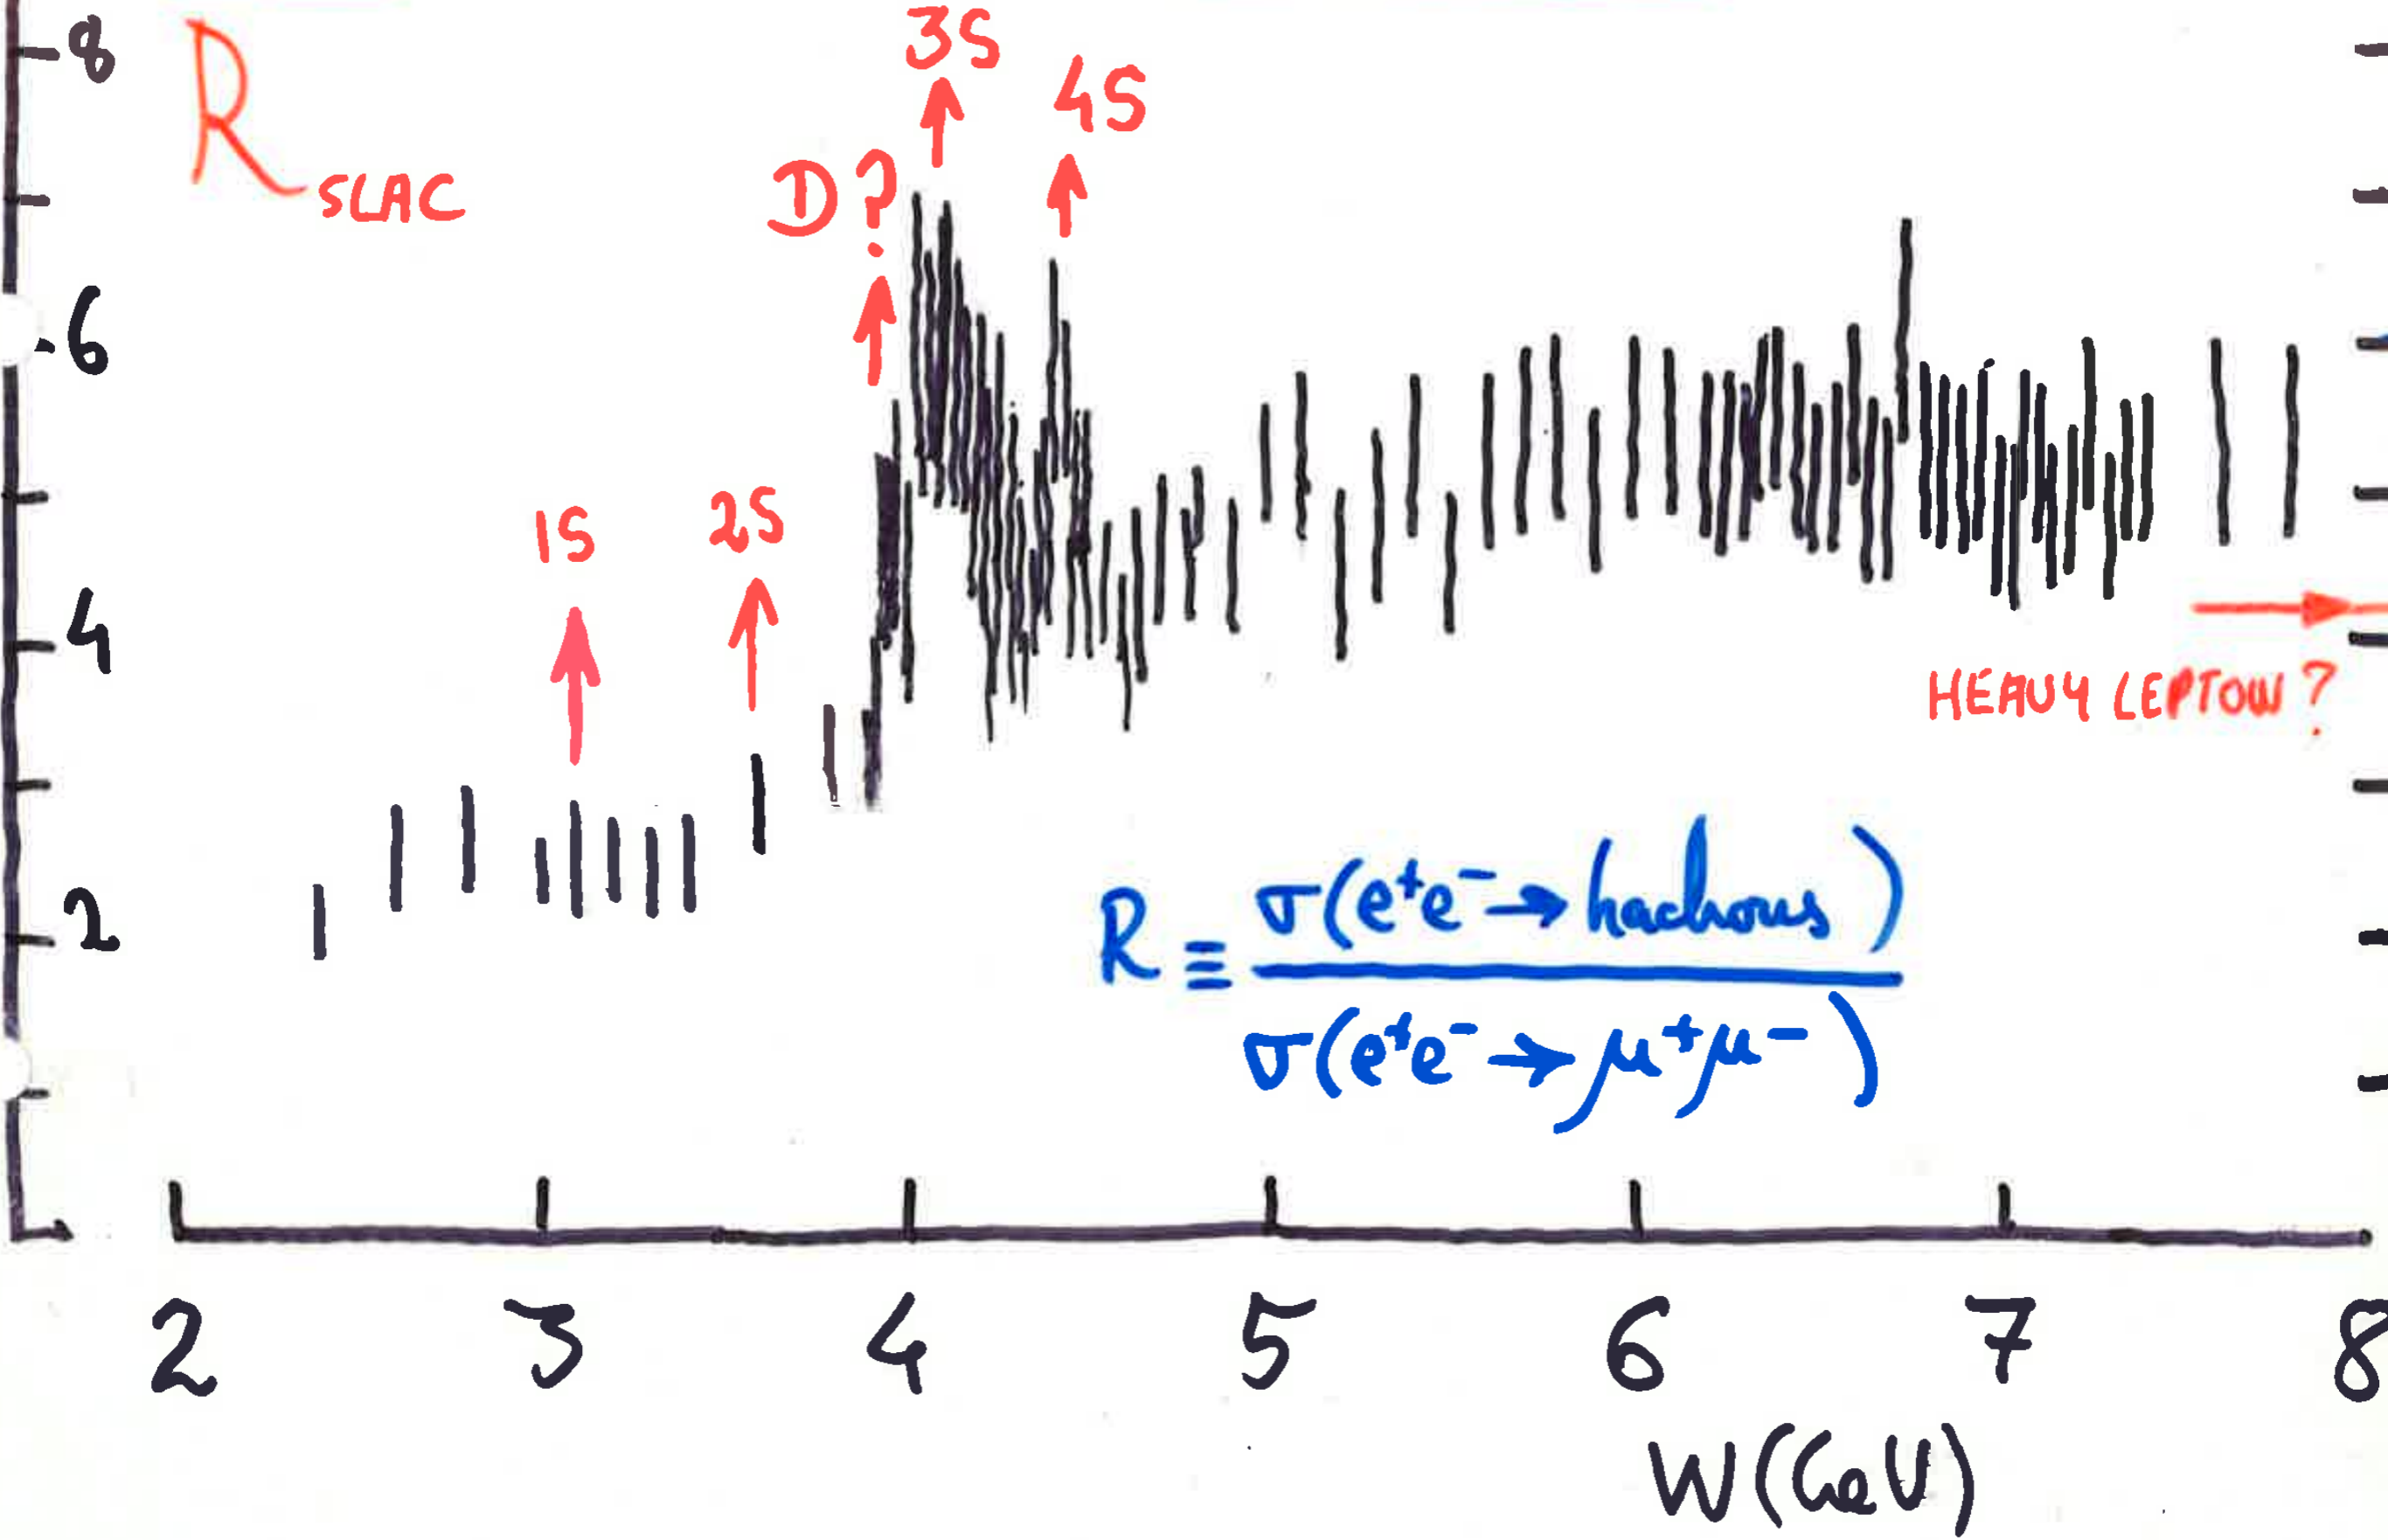

There are three π^+ 's and thus three possible mass differences derivable from this event; these are observed to be 166 ± 15 MeV, 338 ± 12 MeV, and 327 ± 12 MeV. The first of these differences is in remarkable agreement with the 160 MeV predicted for the decay of a spin- $\frac{1}{2}$ charmed baryon Σ_C decaying into a charmed Λ_C .

Counting quarks in e^+e^- annihilation*

A. De Rújula and Howard Georgi[†]

The Physics Laboratories, Harvard University, Cambridge, Massachusetts 02138

(Received 28 October 1975)

A comparison of asymptotically-free-quark-model predictions and e^+e^- annihilation data can be made by using a dispersion relation to continue the data into the spacelike region. We make this comparison for several models, including when appropriate the effect of heavy-quark masses. We conclude that the "old" theory with no charm is excluded, the standard model with charm is acceptable if heavy leptons are produced, and six-quark models are viable if no heavy leptons are produced.
