Grid based search –from Project to Commercialisation

In collaboration with the University of York UK, Cybula Ltd. has been developing a Grid based distributed signal search system, Signal Data Explorer, and taking this to the market. SDE is used to manage, visualize and pattern match over large distributed databases of signal data, allowing users to undertake operations such as diagnostics and prognostics. The tool was developed within the UK eScience projects DAME and BROADEN as well as the latest project CARMEN. This talk will highlight the issues in taking the technology to market from a large research project.

Presenter: AUSTIN, Jim (Cybula Ltd.)
