SM18: Our 1st Crab Cold Test - UK_4Rod

The 3 Proof of Principle Crab Cavity Designs

SM18 Crab Cavity Cold Tests

- **Motivation:**
 - Calibrate CERN's SM18 stand against ODU and BNL results
 - Learn from comparison of techniques and procedures between groups
- **PoP Crab cavities used for comparison**
 - **UK4R:** Our “first test” test cavity: several construction features
 - **RFD:** shipped “Ready to Test”
 - **DQW:** shipped “Almost ready to test” => flanges needed changing
- **RF Cold Tests performed at 2K in CW mode (ie not pulsed)**
- **Location**
 - Cold testing performed in the SM18 V3 cryostat
 - DQW HPR and assembly performed in SM18 ISO4 clean room

Cavity Preparation History

RFD

- **March 2013: RF Test @ JLAB**
 - Bulk BCP – 85 μm
 - Heat treatment: 10 hrs at 600 C
 - Light BCP – ~ 10 μm
 - High Pressure Rinse – 3 passes
 - Cavity assembly + Cold Test
- **August 2014: RF @ JLAB**
 - Light BCP – 15 μm
 - High Pressure Rinse – 2 passes
 - Cavity assembly with Nb coated beam port blank flanges
 - Low temp bake: 24hrs @ 120 C
- **September 2014**
 - Cavity shipped under vacuum
- **October:**
 - Installed & tested in SM18RFD

DQW

- **1st BNL Cold Test**
 - Bulk BCP – 150 μm
 - Heat treatment: 10 hrs at 600 C
 - Light BCP – 30 μm
 - High Pressure Rinse
 - Cavity assembly + Cold Test
- **2nd BNL Cold Test**
 - BCP of 40 μm + HPR
 - 120 C bake for 24 hrs
 - Cold tested
 - Light BCP (40 μm). HPR at ANL.
- **July 2014**
 - Cavity shipped under Nitrogen
- **September: Cavity ports not clean**
- **November:**
 - HPR in SM18: 100bar -2 passes
 - Installed & tested in SM18

RFD: Insert preparation

- Agreement with Jean: “Cavity should see no European air”
 - Cavity installed on insert, pumping line baked before opening cavity valve

RFD: Connection of vacuum pumping line

Done by C.Jarrige
The 16/10/2014

RFD: Connection of Pumping Line - Pressure Profile at 300K

Connection of pumping line not yet ideal

DQW: Preparation Issues

Material inside ports

Flange surface

Flange check

Inside FPC port

Knife Edge

DQW Preparations

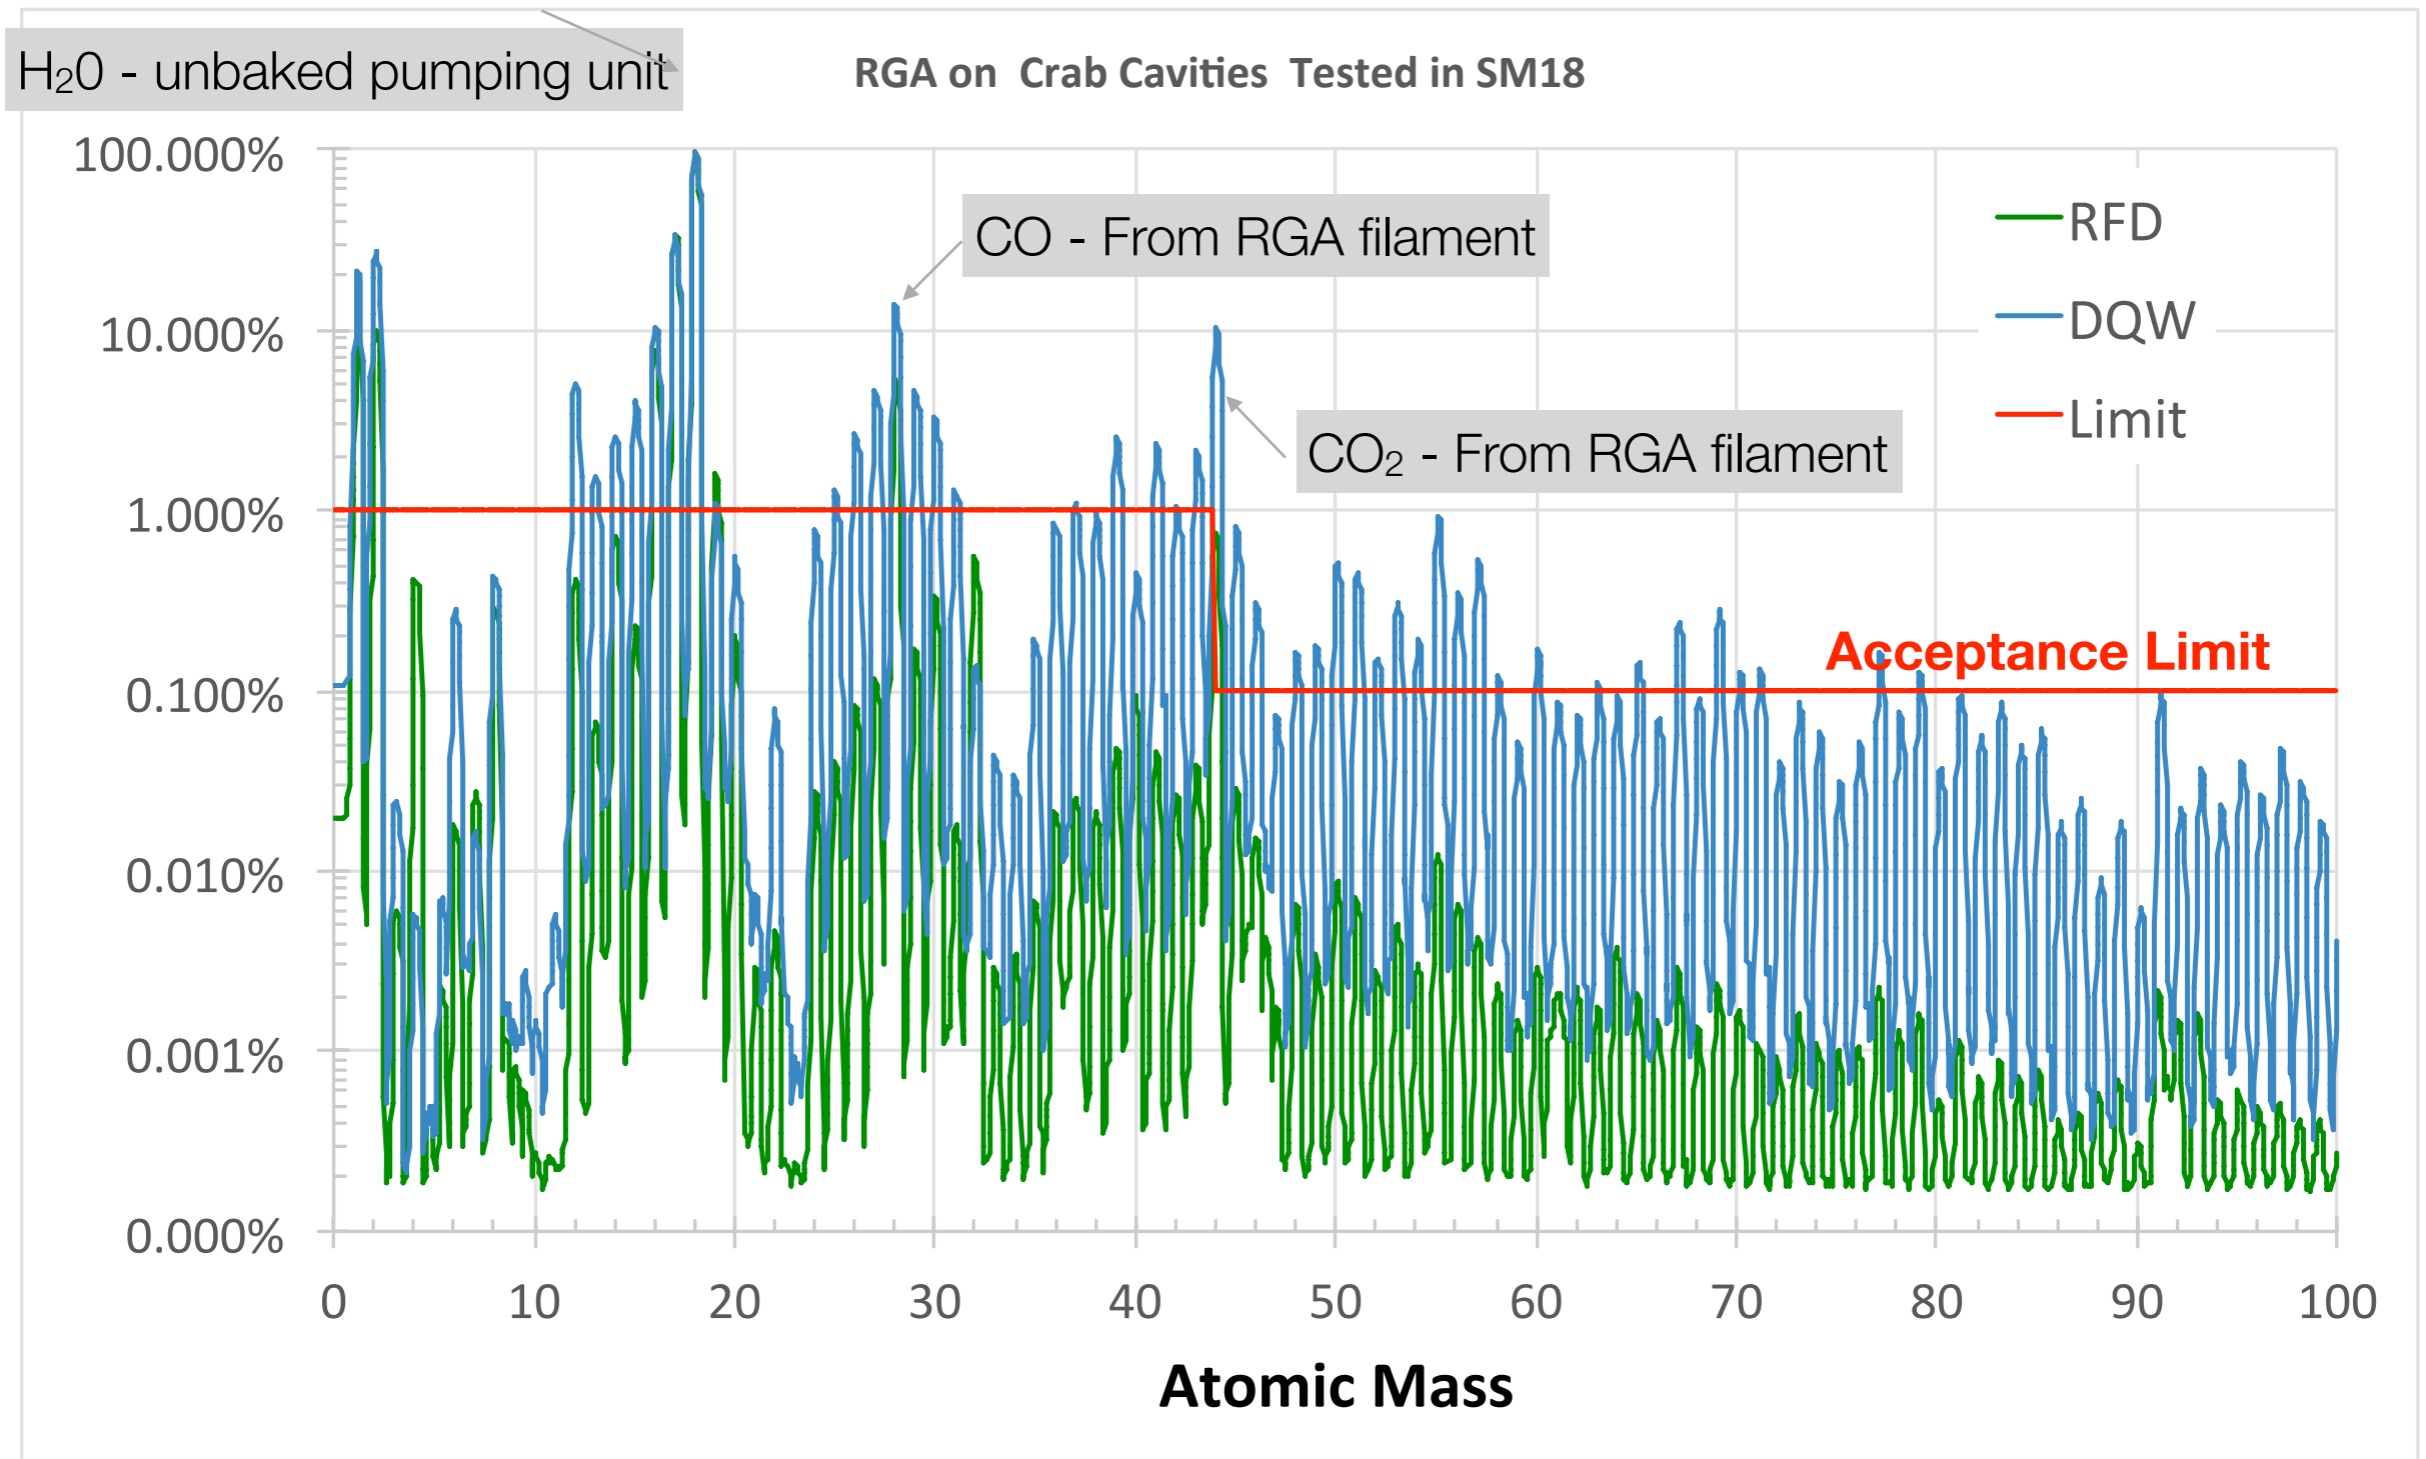

New coating setup: No more evidence of Nb peel off

DQW: Insert preparation

Check: Residual Gas Analysis of Cavity Vacuum

- **RFD:** RGA shows acceptable levels in Cavity vacuum
- **DQW:** RGA showed Hydro carbons at limit of acceptable level

Cold Test Measurements

- **RFD Cold Test**

- Multipacting processing
 - Initial Q0 vs V scan
- RF conditioning
 - Q0 vs V scan
- Thermal Cycle
 - Q0 vs V scan
- Helium Processing
 - Q0 vs V scan
- Warm up above lambda pt
 - Q0 vs V scan
- Warm up

- **Cavity test finished**

- Test Duration:10 days

- **DQW Cold Test**

- Multipacting processing
 - Initial Q0 vs V scan
- RF conditioning
 - Q0 vs V scan
- Helium Processing
 - Q0 vs V scan
-
- **Tests presently ongoing**
 - Testing start: 14 November 2014

RFD Multipacting

- Conditioned away in half an hour by gradual increase in power
- From ODU test: Multipacting expected at $\sim 0.6\text{MV}$
- Matches with what ODU observed

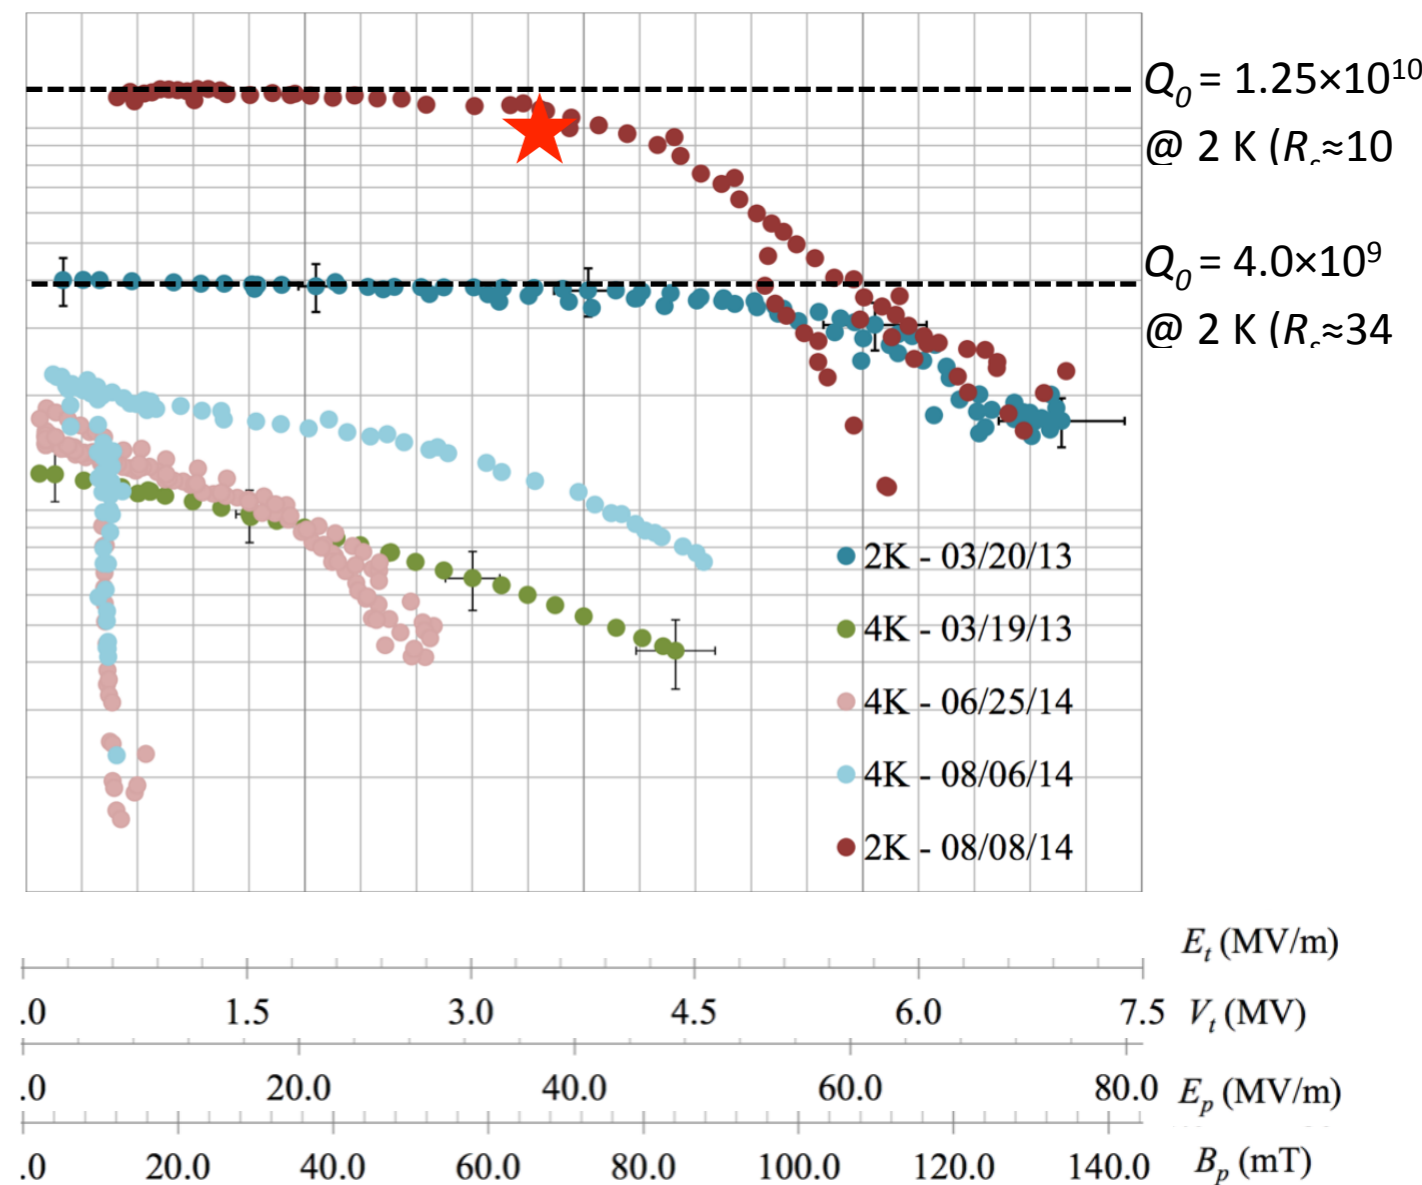

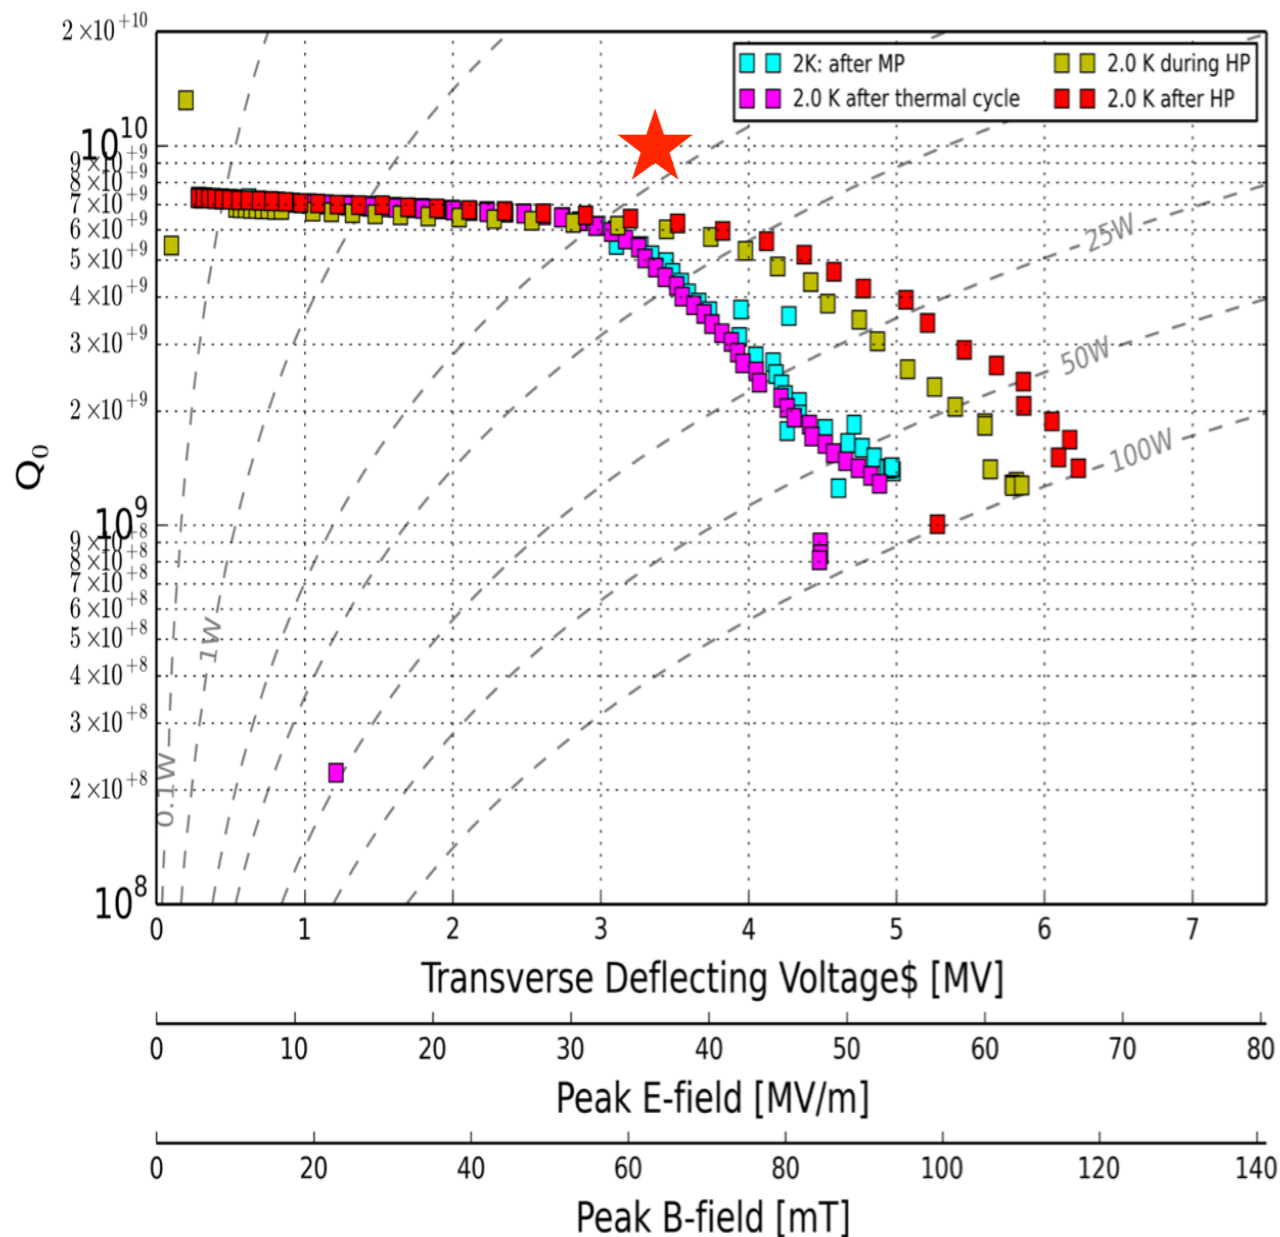

RFD: Performance

- CERN Test**

- $Q_0 = 7.5 \times 10^9$
- Residual Resistance = 16 nOhm
- Max $V_T = 6.2$ MV

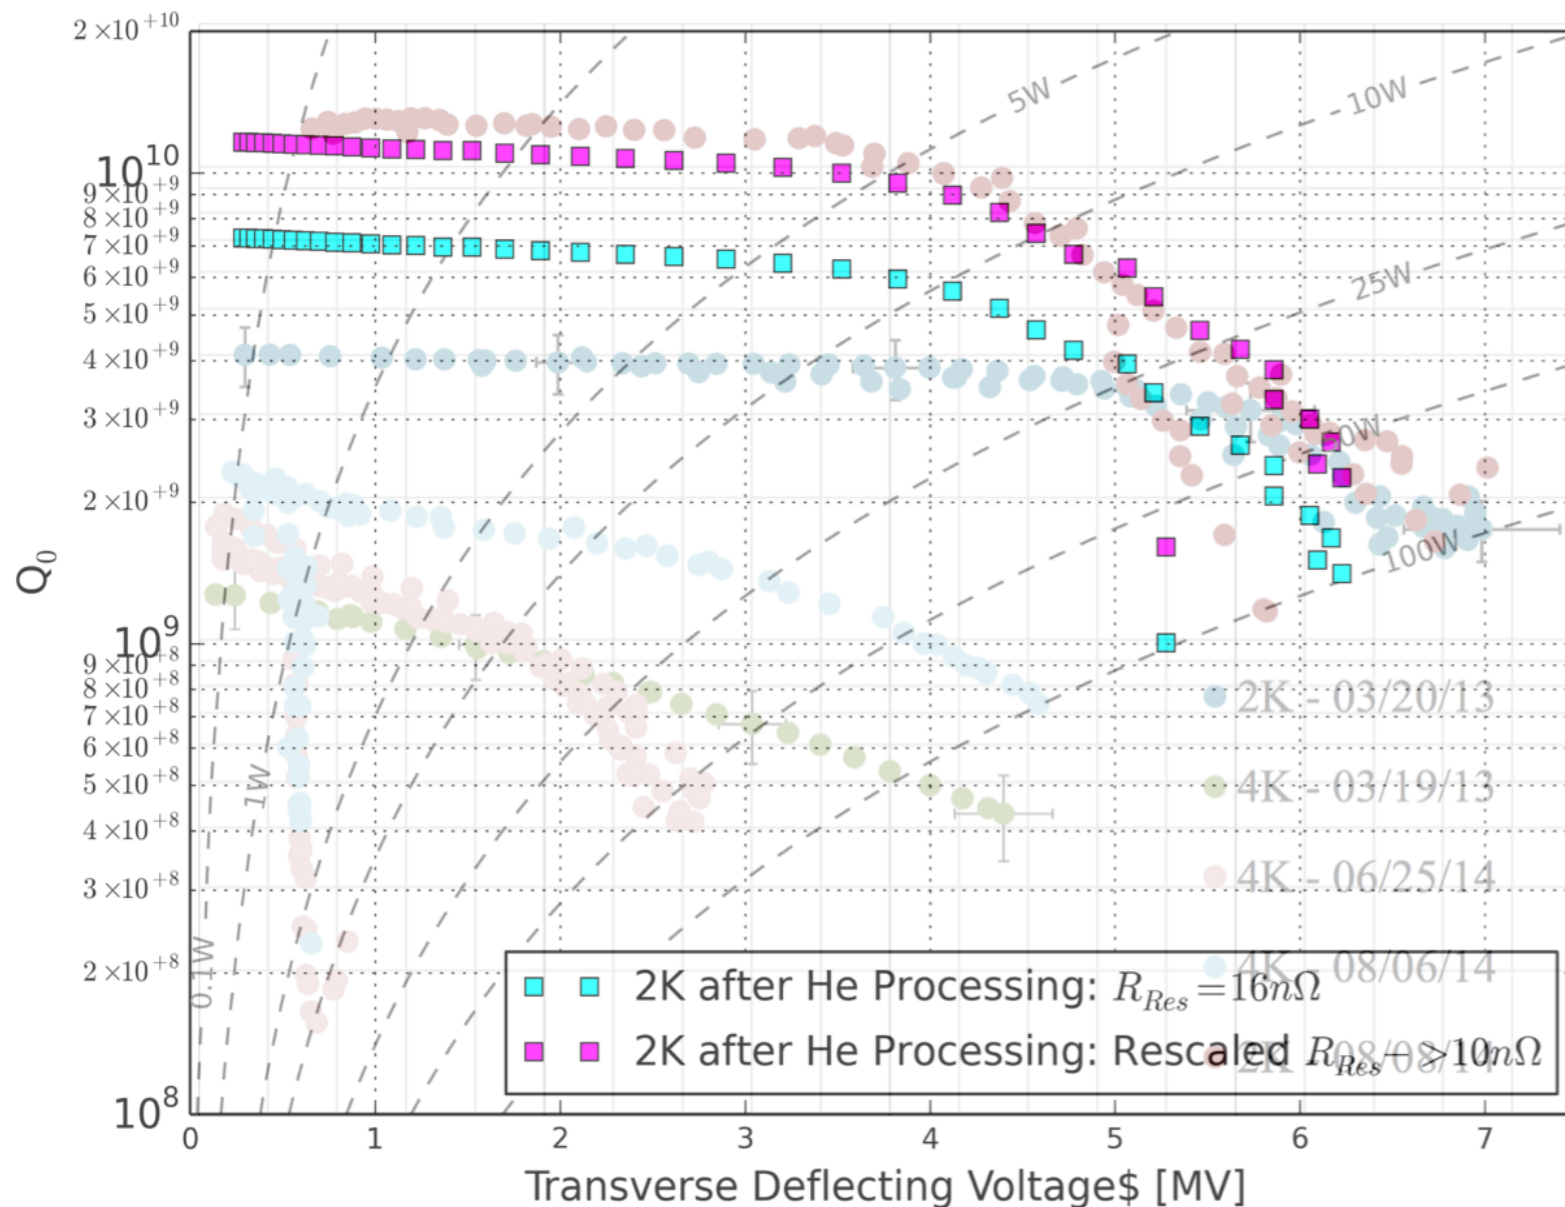

- ODU/JLAB Test**

- $Q_0 = 1.25 \times 10^{10}$
- Residual Resistance = 9.5 nOhm
- Max $V_T = 7.0$ MV

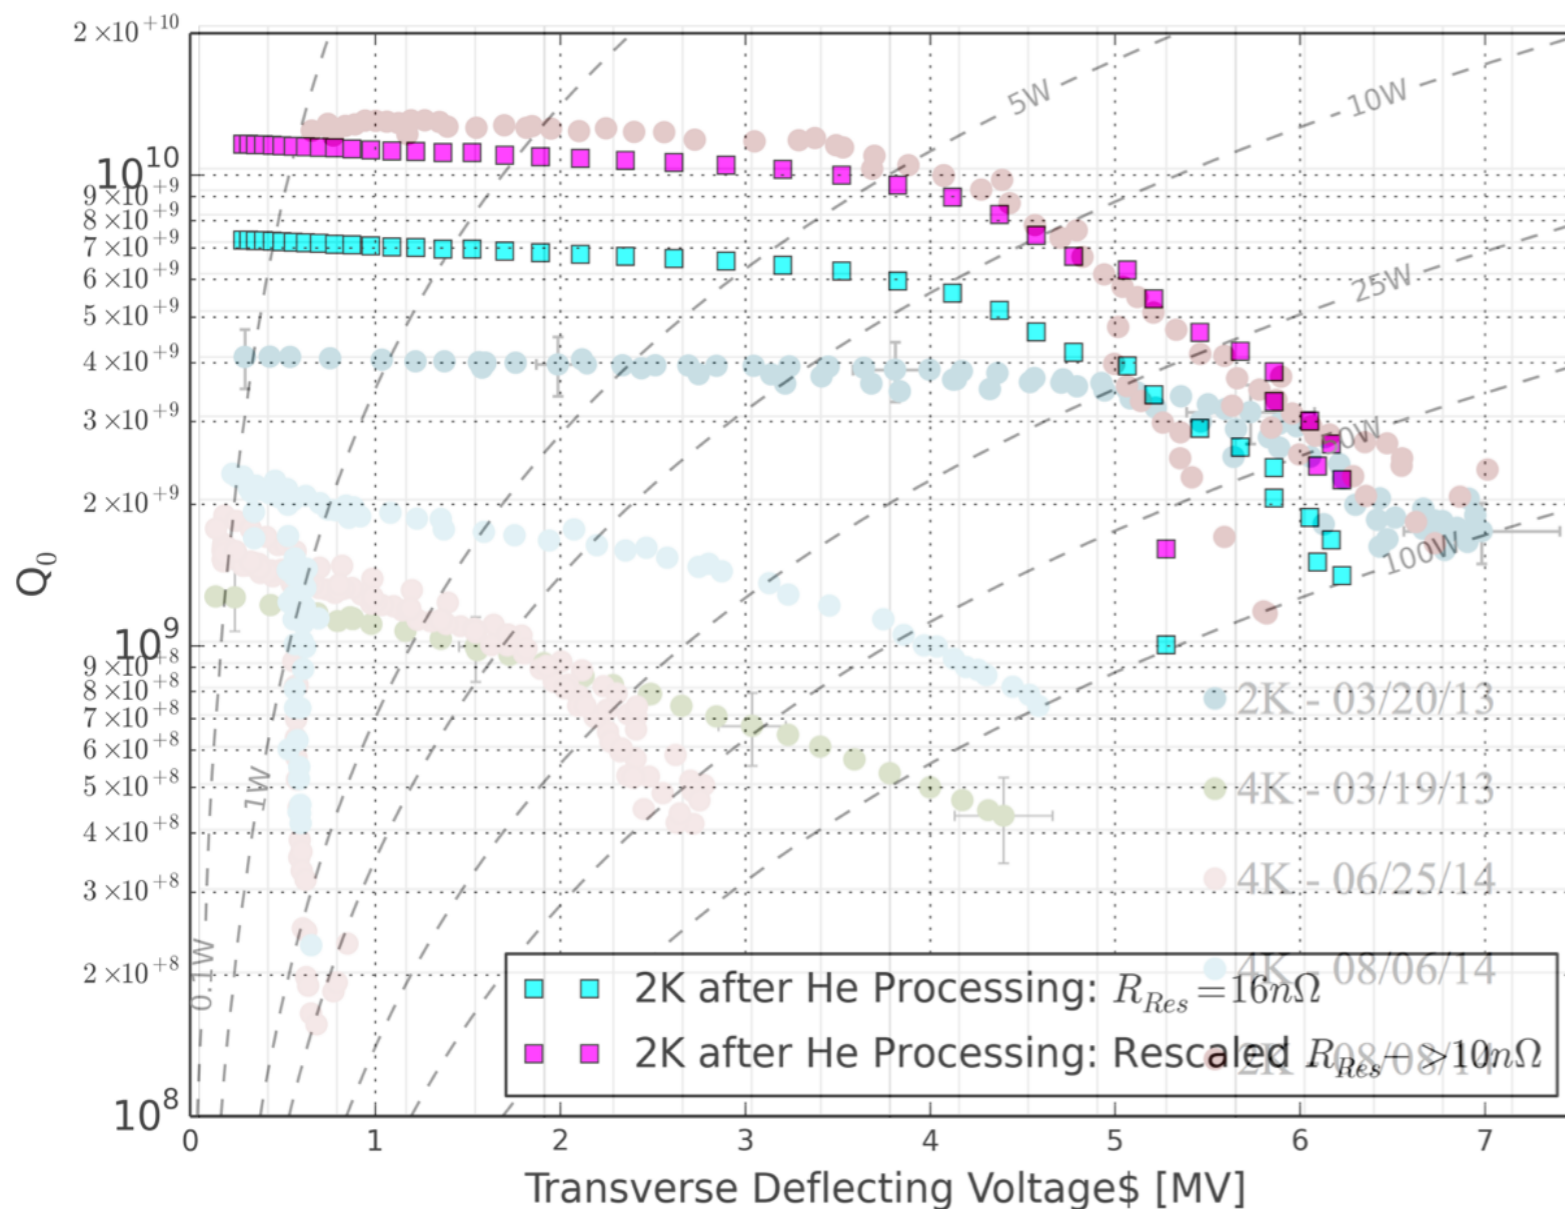

RFD: Comparison with ODU results

- In order to compare, we rescale to same residual resistance
 - At 2.0 K: Q_0 at low field = $7.26 \times 10^9 \Rightarrow R_{\text{Surface}} = 17\text{n}\Omega \Rightarrow R_{\text{Residual}} = 16\text{n}\Omega$
 - Rescale to ODU value of $R_{\text{Residual}} = 9.5 \text{ n}\Omega \Rightarrow$ What Q_0 would we have?

RFD: Comparison with ODU results

- In order to compare, we rescale to same residual resistance
 - At 2.0 K: Q_0 at low field = $7.26 \times 10^9 \Rightarrow R_{\text{Surface}} = 17\text{n}\Omega \Rightarrow R_{\text{Residual}} = 16\text{n}\Omega$
 - Rescale to ODU value of $R_{\text{Residual}} = 9.5 \text{ n}\Omega \Rightarrow$ What Q_0 would we have?

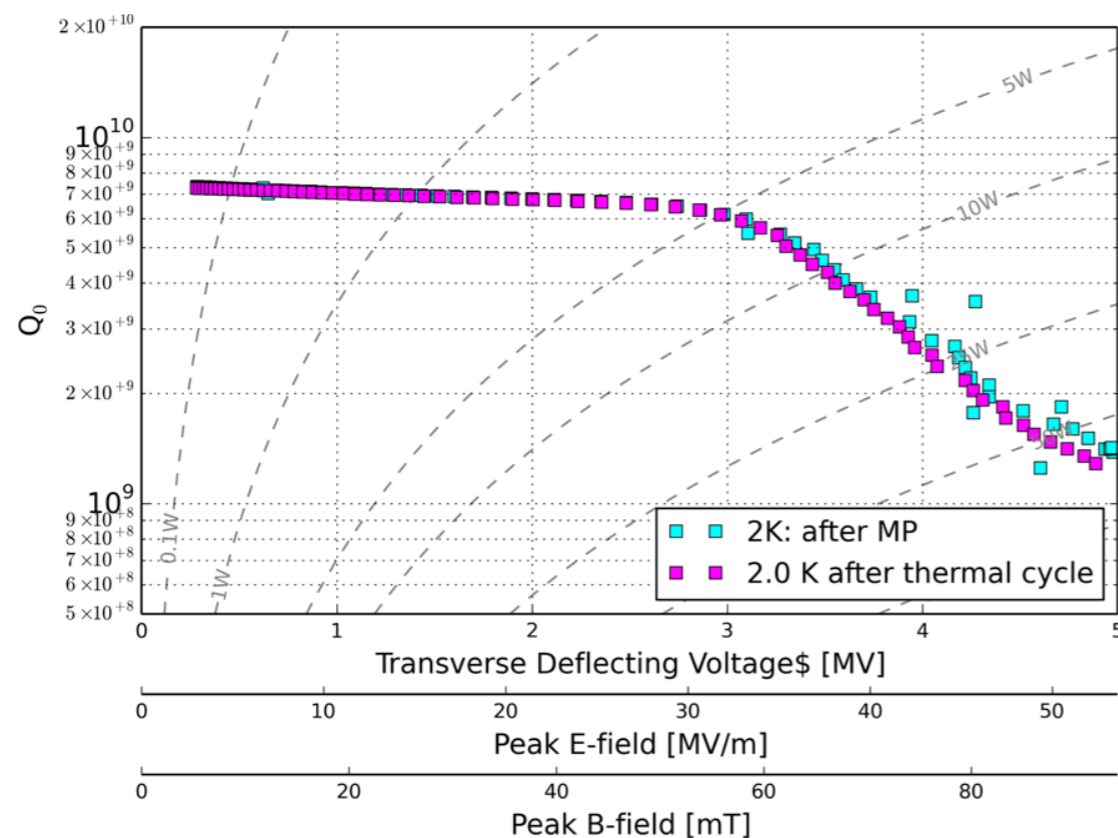

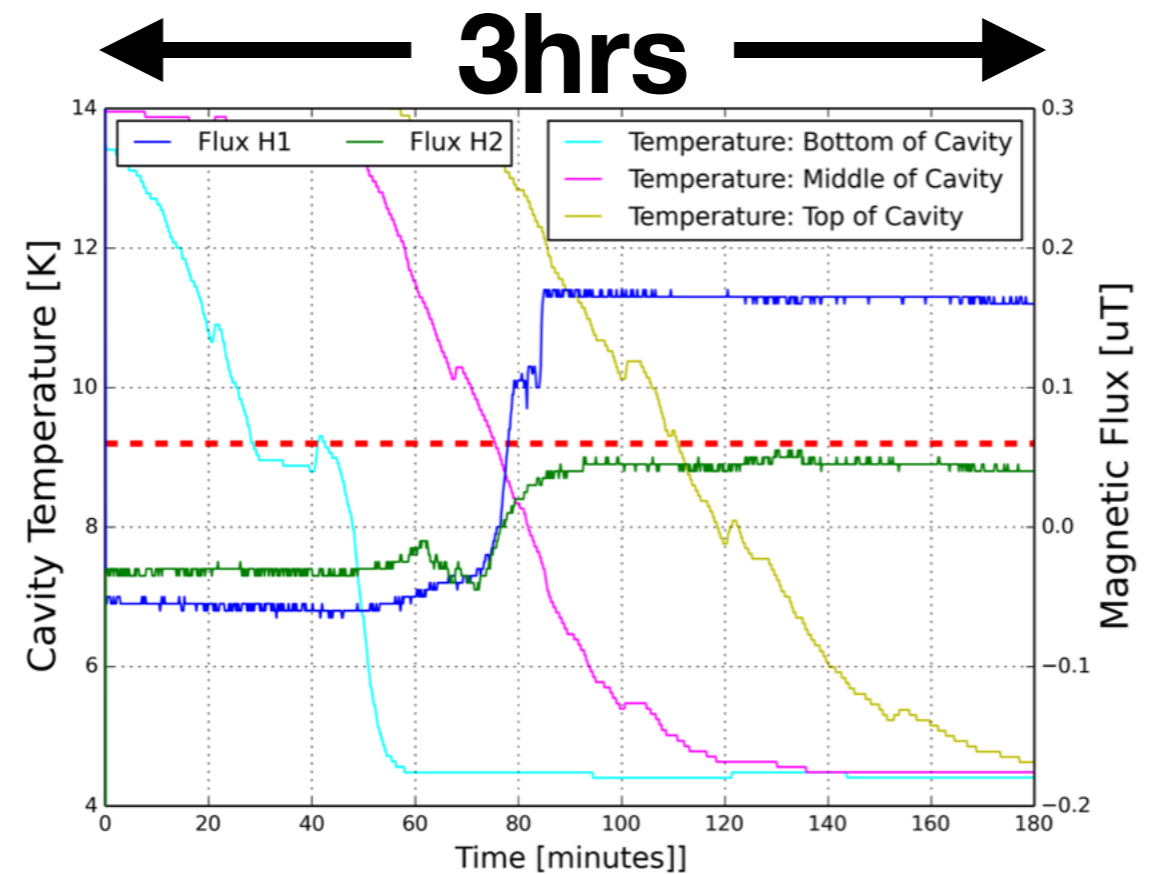

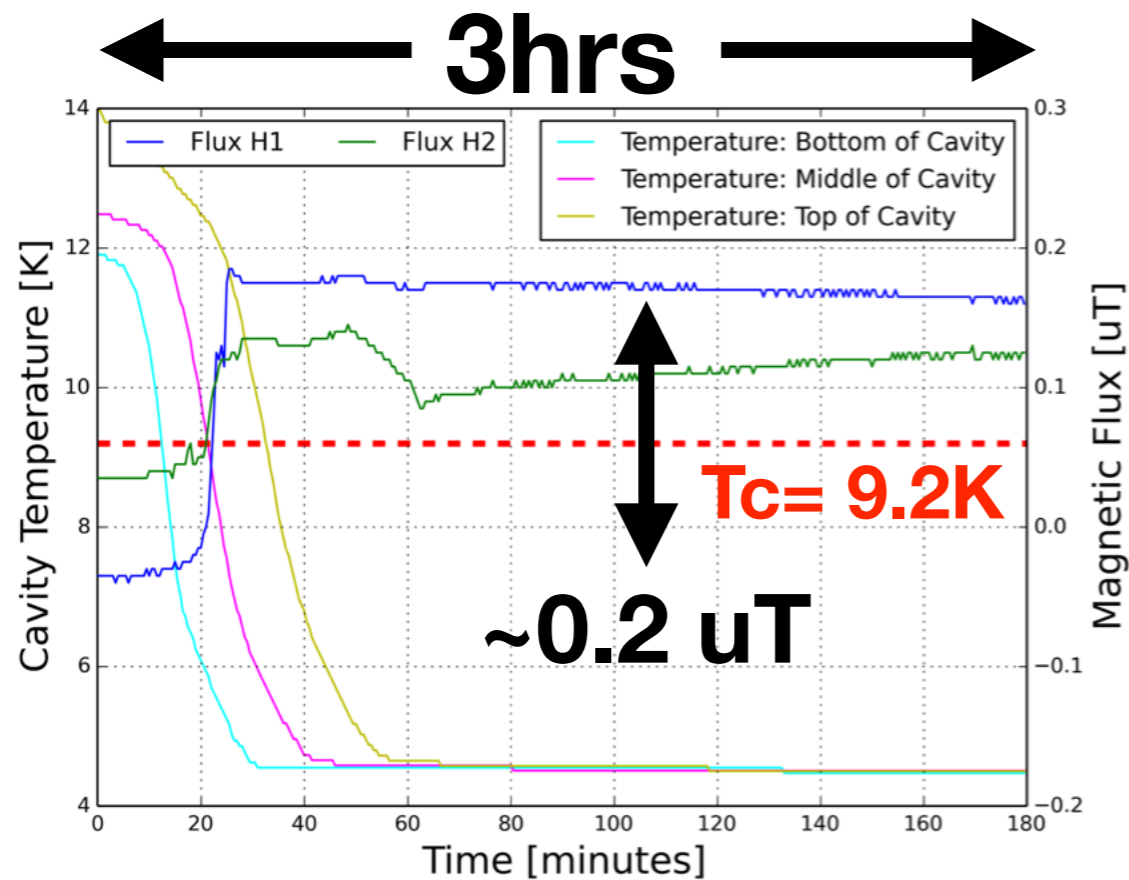

Reasons for higher R_{Res}

- **Peel off of Nb coating on Inox flanges**
 - Discussion with Jean about opening cavity
- **Ambient B-field compensation**
 - Vertical component not fully compensated at T_c
- **Degradation of surface during shipping?**
 - No real evidence

RFD: Transition through T_c & ambient magnetic flux

RFD: Transition through T_c & ambient magnetic flux

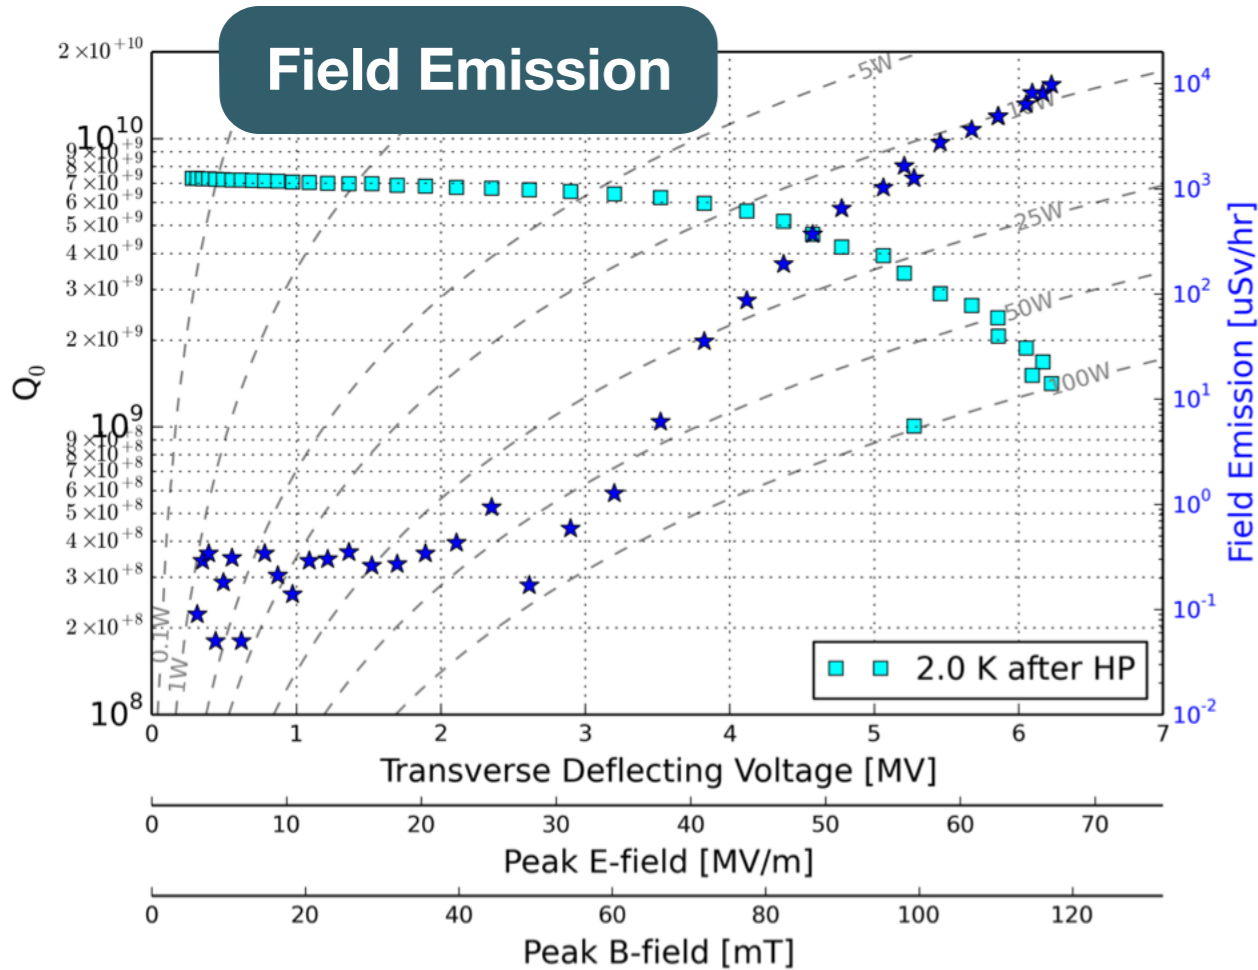

- Clear spatial temperature gradient
- 2 different cooling rates tried
 - No performance difference
 - Not yet a systematic study ...
- Flux expulsion at level of $\sim 200\text{nT}$

RFD: Temperature Monitoring

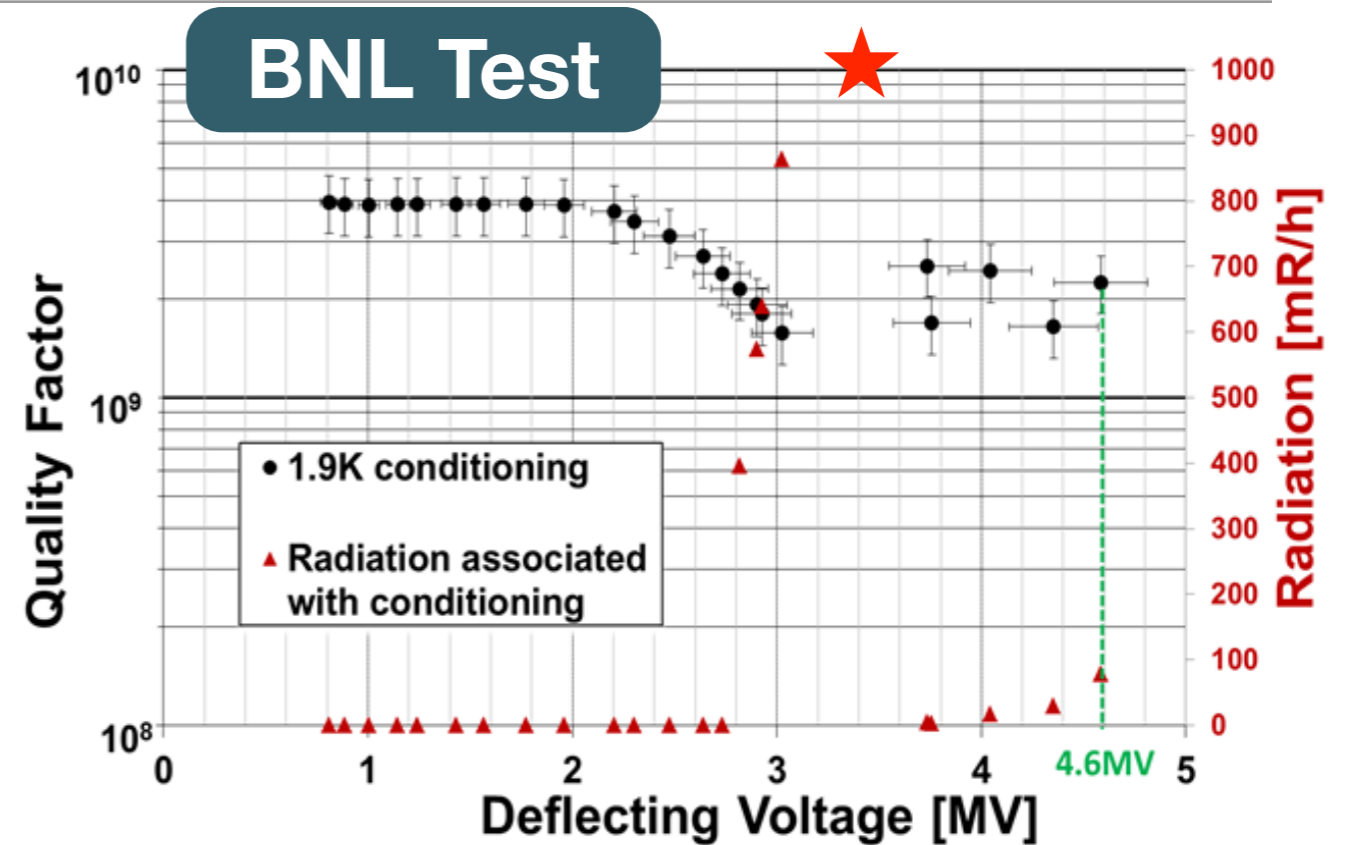

RFD: Temperature Monitoring

- **Field emission at above 3MV**
 - => induces collapse of fields
- **Heating observed on cavity**
 - appeared in High E-field region
 - measured on outer surface

DQW: Comparison of results with BNL

- Please note:
 - Cold test is still ongoing
 - Cavity conditioning still ongoing
 - Helium processing not yet done

DQW: Comparison of results with BNL

• Please note:

- Cold test is still ongoing
- Cavity conditioning still ongoing
- Helium processing not yet done

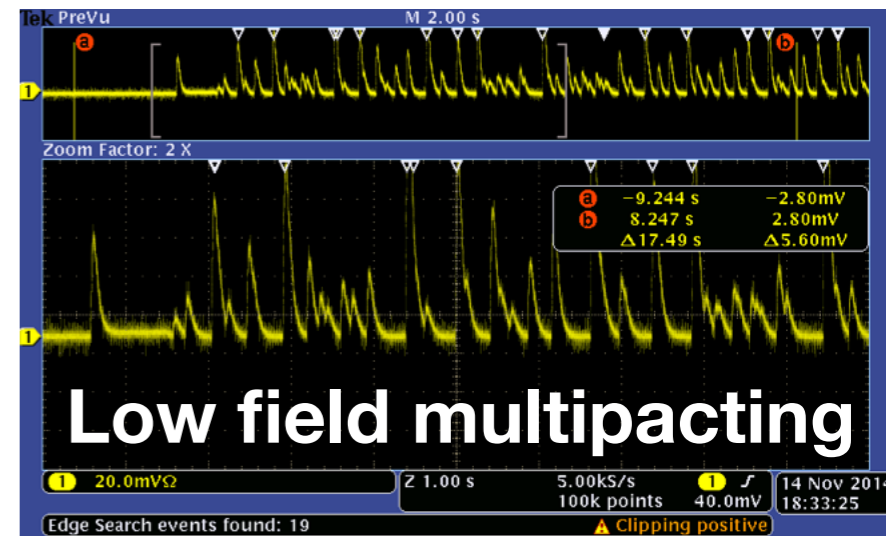

DQW: SM18 Cold test results

- Low field Multipacting conditioned away
- Higher field discharges observed
- **Residual resistance ~ 23.5 nΩ (18.3 nΩ at BNL)**
- Low Field $Q_0 = 3.45 \times 10^9$

**DC current monitor
on pickup antenna**

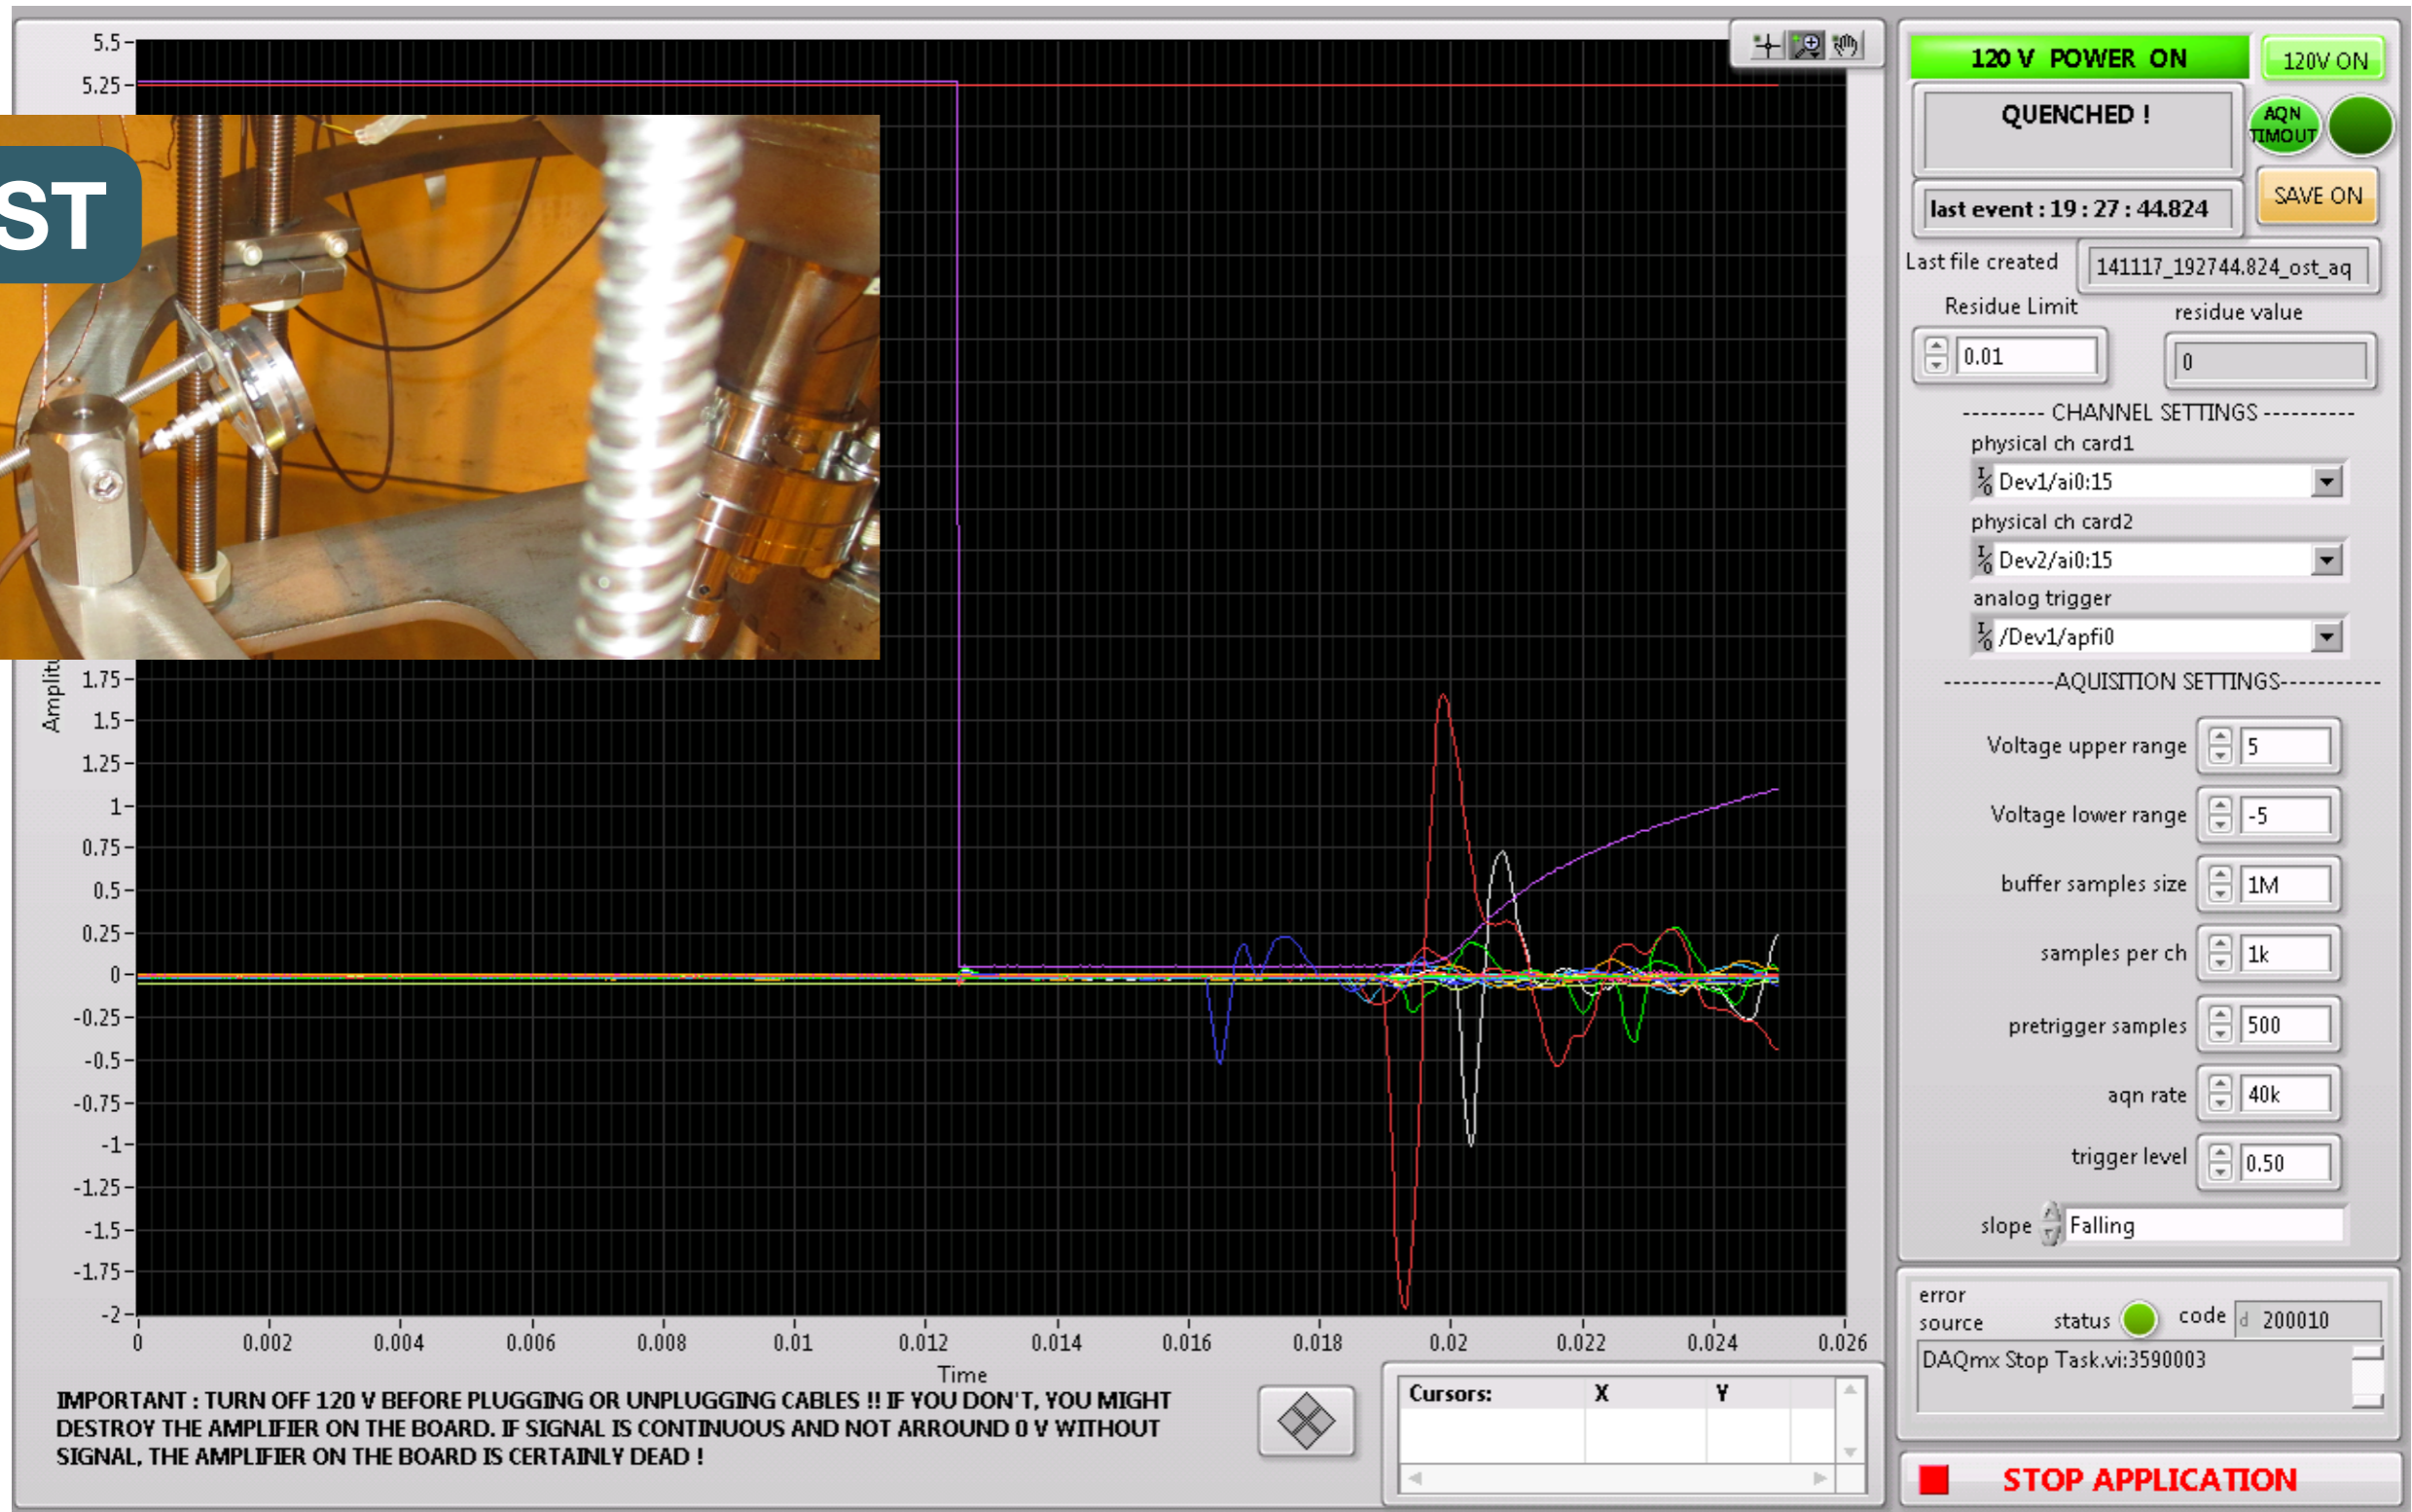

Low field multipacting

DQW: Quench monitoring from 2nd Sound

STOP APPLICATION

Outlook into 2015

- **Continue with DQW tests until 28th November**
 - SM18 Cryo stop 17th December till End of February
- **Cryo shutdown: Need to upgrade cryostat inserts & test stand**
 - Prepare inserts for testing with mobile power coupler and cavity tuner
 - Upgrade large cryostat insert ... possibility of 2 crabs in 1 cryostat
 - **Make operational a medium size cryostat specifically for crab testing**
- **Once cryo restarted March 2015: Cold test of PoP Cavities**
 - Cavity test with tuner + re-test & study PoP Cavities
 - Quench studies and input measurements for LLRF design
- **2015: Follow layout + tooling preparation for SM18 M7 Horizontal bunker**
 - Includes both clean room and bunker preparations
