

Jet quenching results from CMS

Thursday, 30 July 2015 09:30 (30 minutes)

This talk reviews recent experimental results on jet production and properties in heavy-ion collisions from the CMS Collaboration, including jet spectra, jet fragmentation pattern, angular distribution of the quenched energy, photon-jet and dijet asymmetry. The presented results utilize the high statistics pPb data at center-of-mass energy of 5.02 TeV and PbPb data at 2.76 TeV collected in 2011-13 at the LHC.
